Also sponsored by Kansas Medical Society, ka, and the Kansas State Board of Health, ka.

Course limited to one student.

Formal basic science courses in prepara- for specialty board certification.

These are basic courses in medicine, sur- anesthesiology, obstetrics and gynecol- otolaryngology, pathology, pediatrics, logy and urology.

Also sponsored by the Indiana Heart dation.

Plus $5.00 registration fee.

Also sponsored by the Minnesota Heart ciation.

$20.00 for physicians within the area (i. e.), ahoga, Geauga, Lake, Lorain and Ashta- counties.

Also sponsored by the Connecticut State cal Society.

Also sponsored by the Kettering Labora- .

Second half of course from January 10- 17.

Also sponsored by the Indiana Cancer ety.

. Also sponsored by the Vermont State cer Society, Montpelier, Vt.

. Also sponsored by University of Chicago, ersity of Illinois., Northwestern University, tch School of Medicine and Chicago Medi- College.

. Also sponsored by M. S. M. S., Wayne versity and Michigan Department of Health.

. Membership in the Missouri State Medical ociation, plus guest.

. Membership in the Missouri State Medical ociation.

. These courses are prepared for the benefit G. P.'s who want concentrated instruction a location easily accessible to them.

. $15.00 for nonmembers of A. A. G. P. or thwestern Ohio Society of G. P.

20. Only alumni of the Jefferson Medical College are eligible to enroll.

21. $10.00 to all M.D.'s not members of the Philadelphia County Medical Society.

22. For physicians in Texas.

23. For physicians in G. P. or specialties other than psychiatry.

24. For psychiatric residents.

25. Sponsored by Massachusetts Department of Mental Health, 15 Ashburton Pl., Boston, Mass.

26. The stated two week period may be followed by additional studies at $100 per week. The course may also be taken by Philadelphia area physicians on six consecutive Thursdays, 36 hours at $150.00.

27. Limited to specialists in EENT.

28. One month, $150.00; 3 months, $250.00; 6 months, $450.00; 9 months, $650.00; 12 months, $850.00.

29. Also sponsored by State Department of Health.

30. For ENT diplomates.

31. Also sponsored by the N. F. I. P., 120 Broadway, New York City.

32. Also sponsored by Albany Medical College, Albany, New York.

33. Given in conjunction with the American College of Chest Physicians and A. A. G. P.

34. Two weeks, $110.00; 1 month, $200.00; 2 months, $300.00.

35. For qualified general surgeons.

36. (*a*) Attendance is encouraged from Regular, Reserve or National Guard Medical Officers of the Armed Forces on active duty, at government expense. Attendance will be considered on a space available basis and at the individual's own expense from individuals in the following priority: (A) medical officers of the Armed Forces not on active duty; (B) physicians and surgeons from other Federal Agencies; and (C) civilian physicians.

(*b*) Application procedure: Applications should be forwarded, so as to reach the addressee listed below not later than one month prior to the opening date of the course;

1. Applications from Army Medical Officers on active duty, will be forwarded to the Office of the Surgeon General, Department of the Army, Washington 25, D. C., Attention: Personnel Division, Career Management Branch.
2. Applications from medical officers from other branches of the Armed Forces should be forwarded through channels as appropriately announced.
3. All other applications should be forwarded to the appropriate Hospital Commander of the installation offering the courses. Applications will be approved on a space available basis.

(*c*) For specialists only, i. e., Chiefs or Assistant chiefs of services or officers well advanced toward certification.

(*d*) Course designed to be of interest to both the specialist or general practitioner.

(*e*) The course is open to (1) ophthalmologists, (2) pathologists.

37. Sponsored by N. C. State Board of Health, scholarships awarded by North Carolina State Board of Health.

38. Qualified Psychiatric Professionals.

39. Qualified Psychiatric Professionals who have had a personal psychoanalysis plus at least 5 years of Psychotherapeutic experience.

40. For specialists.

41. Also sponsored by Oregon Academy of Ophthalmology and Otolaryngology, 1216 S. W. Yamhill Rd., Portland.

42. Two weeks $110.00, 1 month $200.00 and 2 months $300.00.

43. Applications must be accompanied by a list of surgical operations performed in the past six months, with the following information concerning each; hospital number, nature of operation, deaths, complications and end results.

MEDICAL MOTION PICTURES

Breakdown: 16 mm., black and white, sound, showing time 42 minutes. *Produced in 1951 for the Mental Health Authorities of the Provinces of* Canada by the National Film Board of Canada. Procurable from the National Film Board of Canada, 400 W. Madison St., Chicago 6, and 1270 Avenue of the Americas, New York 20.

This film deals with a young girl's schizophrenic breakdown: its onset and development, the effect on her family and her friends, her hospitalization in a modern mental hospital, and eventual discharge as recovered. Hospital scenes show an ideal mental hospital where modern methods of treating the emotionally ill are demonstrated and discussed. An appeal to the public is made for greater understanding of mental illness and *the need for removal of the stigmas traditionally attached to* mental illnesses. The objective of the film is to point out that mental illness can happen to anyone and that with known treatment technics it can be cured. The producers of this film adhere faithfully and consistently to their aim and within the limits of the running time of the film present a convincing story.

All the characters are well portrayed, and the portrayal of the schizophrenic is particularly excellent. The various scenes are appropriate and enhance the content of the narrator's message. The use of the family doctor as a source of information is particularly good; it shows the need for the general practitioner to become more informed regarding the problem of mental illness. What can be done toward the care, comfort, and eventual recovery of patients in a good mental hospital is well illustrated. Hospital scenes show an ideal mental hospital that is adequately staffed and where modern treatment technics are demonstrated and discussed. The film did not bring out that, as yet, treatment facilities as shown are rare. The hospital situation portrayed represents an ideal setup, rather than what one can expect in most mental hospitals.

The film is too elementary for use with professional persons in mental health work. However, psychiatrists, psychologists, and others in allied professions can use the film to good advantage when they are called on to present mental health information to special interested groups. The film is also recommended for county and state medical meetings and for college students in edical, nursing, social work, and psychology departments. The otography and narration are very well done.

Your Children's Eyes: 16 mm., black and white, sound, showing time 19 minutes. Produced in 1945 by Realist Film Unit. Procurable from British Information Service, 30 Rockefeller Plaza, New York 20.

This film describes the anatomy and physiology of the eye. It explains in a descriptive manner common defects such as short and long sightedness and other diseases of the eye. The rules to be followed for the maintenance of healthy eyesight are outlined, and it is pointed out that medical advice should be sought in cases of organic defects or diseases.

The illustration of the anatomy of the eye is accomplished in a very superior and clear manner by the use of a whole orange and its parts to simulate the structure of the eye. The presentation is technically accurate as well as interesting. It is suggested that this film be used in two parts, the first part containing the anatomy and disorders of the eye and the second part the treatment of disorders.

The first part is recommended for use on the intermediate and secondary school level, but the entire film would be of interest to adults. The photography and narration are well done.

Transabdominal Vagotomy with Gastro-Enterostomy: 16 mm., color, silent, showing time 33 minutes at sound speed. Produced in 1951 by and procurable on loan or purchase from Philip Thorek, M.D., 25 East Washington Street, Chicago 2.

This motion picture shows the technic of performing transabdominal vagotomy and gastroenterostomy for duodenal ulcer. The first reel consists largely of anatomic drawings clearly illustrating important points in the surgical anatomy of this combined surgical procedure. A brief case report is also included. The second and third reels show the actual performance of
vagotomy and gastroenterostomy on a patient, supplem
appropriate illustrations. The surgical procedures are
shown and well presented. The film is rather long and
edited to advantage. It can be recommended to dem
surgical anatomy and technic to medical students, interns,
dents, and surgeons. The drawings are well done; however,
of the legends are difficult to read. Otherwise the photo
is good.

Clinical Use of Hyaluronidase: 16 mm., color, sound, showing
minutes. Produced in 1951 at Columbia University College of Ph
and Surgeons at Presbyterian Hospital, New York, by Worces
Corporation, Worcester, Mass. Procurable on loan from Wyeth,
porated, 1401 Walnut St., Philadelphia 2.

This is a scientifically accurate presentation of the
facts concerning the clinical use of hyaluronidase, which
elective adjunct to the administration of parenteral fluids
anesthetics, and other drugs. Although some of the demon
uses are presented in an appealing manner, the practical
cation of some of these procedures would be limited. The
the film is recommended for showing to groups interested
clinical applications of the enzyme hyaluronidase, and it
be of interest to general practitioners as well as surgeons
ever, data are presented which would be difficult to stud
out a supplementary brochure. The picture is very well org
and the photography, animation, and narration are ex

MISCELLA

Factors in the Decrease in Infant Mortality.—Accordin
Statistical Bulletin, Metropolitan Life Insurance C
August, 1951, infant mortality in the United States
cut by about one-half in little more than 15 years. In 19
when nation-wide data first became available, the de
among children under 1 year of age averaged 59 per 1,
births; by 1948 the rate had dropped to 32 per 1,000,
it is somewhat under 30. Virtually all the major causes
mortality have shared in the improvement. However, th
of the gains for the individual causes vary widely.

The infectious diseases have shown the greatest redu
mortality. The death rate in infancy from the princip
municable diseases of childhood (especially whooping
syphilis, and tuberculosis, dropped 75% or more betwe
1934 and 1948, the latest year for which detailed data a
able. For diarrhea and enteritis the reduction was near
and for pneumonia and influenza more than 60%. The
factors in the better control of the major infections in
have been the widespread use of chemotherapy and
biotics, immunization and other preventive measures, i
infant feeding and care, the increased use of the hos
confinement and illness, and the marked rise in the
of living.

The death rate from premature birth and from co
debility and "other diseases peculiar to the first year
dropped nearly one-third in the period under review.
mortality from congenital malformations decreased 14%
reductions have resulted mainly from the better h
mothers during pregnancy and from improved care o
immediately after birth.

The death rate from accidents has failed to show any
The facts on accidents in infancy are not altogether
Deaths ascribed to mechanical suffocation, which const
most one-half of the accident total under age 1, are o
to undiagnosed respiratory illness. There is, neverthele
to strengthen the safety program for babies.

Premature birth continues to be the major problem,
ranking every other cause of infant mortality. The attent
being focused on this problem by medical and publi
agencies encourages the belief that prematurity will be
reduced as a cause of infant death.

Myth of Strict Bed Rest in Heart Disease.—There is clin-
ınd physiological evidence that strict bed rest is deleterious
tients with congestive heart failure. If heart failure is pres-
the heart obtains more rest when the patient is in a chair
the feet down than while he is recumbent in bed, even if
ead and back are elevated. Most patients with threatened
vident congestive heart failure should be treated, not in
but in a comfortable chair, and when they do go to bed at
to sleep, 8 to 9 inch blocks should be placed under the
posts to encourage gravity to keep body fluids in the legs
r than in the lungs. This principle has also been applied in
reatment of acute coronary thrombosis. The author ob-
d a mortality of only 10% a group of 70 patients with acute
nary thrombosis who were placed in chairs for varying and
asing periods of the day beginning not later than the first
of the attack. The results of this method of treatment seem
uraging and appear to have both physical and psychic ad-
ages over the strict bed rest method of treatment.

ertensive Vascular Disease.—Statistical information has
gathered concerning the life history of 100 patients fol-
d from the time of onset of hypertension until death. The
p included 38 men and 62 women. Twenty-six of the patients
a family history of hypertensive vascular disease. In four
nts the onset of hypertension was associated with pregnancy.
average age of onset of hypertension was 32 and the aver-
age at death was 51. Thus hypertensive vascular disease
lly begins in early adult life and has an average duration of
to two decades. Although 24 of the women had preg-
ies during the period of observation, in only 4 was there any evident relationship between pregnancy and the onset of disease. As hypertension may have preceded conception in two patients in whom the last normotensive readings had been many months before, these data suggest that sustained elevations of blood pressure after a pregnancy are indicative generally of antecedent disease. The primary cause of death was not known in 41 of the patients. Congestive failure was the primary cause of death in 19 patients, cerebral vascular accident in 17, myocardial infarction in 7, uremia in 6, arteriosclerotic aneurysm of the aorta in 3, and miscellaneous unrelated causes in 7. Multiple complications are more frequent than single ones, and the time of onset and the intensity of any given complication vary enormously. Nevertheless, measured in terms of single complications, the average survival period was five or more years in each instance, except in patients with cerebral vascular accidents or papilledema or nitrogen retention.

Retrolental Fibroplasia: Evaluation of Dietary Supplements.—While both clinical and experimental investigations now indicate that retrolental fibroplasia does not result from vitamin A deficiency in either the mother or infant, recent data still suggest that nutritional factors may play a causal role. Observations reported in this paper indicate that withdrawal of the water-miscible multiple vitamin preparation and iron used as supplements to the diet of premature infants weighing less than 4 lb. (1,814.37 gm.) at birth and substitution of only vitamins D and C in water-miscible form were without apparent effect on the incidence of retrolental fibroplasia. Administration of *dl*-alpha-tocopherol acetate in daily doses ranging from 30 to 150 mg. to premature infants at the time the eyes showed vascular changes characteristic of the early stages of retrolental fibroplasia did not reduce the incidence of the severe form of the disease significantly. Of the premature infants given 50 mg. of *dl*-alpha-tocopherol acetate prophylactically from birth three times a day vascular changes developed in 56%, and vitreous and retinal changes associated with retrolental fibroplasia also developed in 40%. Of the infants given *dl*-alpha-tocopherol acetate from birth the severe form of the disease involving membrane formation developed in 5%, as compared with 11% who did not receive *dl*-alpha-tocopherol acetate prophylactically. This difference in incidence is of doubtful significance. The average plasma level of vitamin E in infants at birth was found to be 0.6 mg. per 100 cc., suggesting that premature infants are not particularly deficient in vitamin E. No correlation was observed between the plasma level of vitamin E in the premature infant and the incidence of retrolental fibroplasia. The large proportion of patients who recover, apparently spontaneously, from retrolental fibroplasia suggests the need for caution in evaluating forms of therapy.

Association library lends periodicals to members of the Association
to individual subscribers in Continental United States and Canada
period of five days. Three journals may be borrowed at a time.
dicals are available from 1940 to date. Requests for issues of
r date cannot be filled. Requests should be accompanied with
ps to cover postage (6 cents if one and 18 cents if three periodicals
requested). Periodicals published by the American Medical Associ-
are not available for lending but can be supplied on purchase order.

Prevention of Lymphedema of Arm After Mastectomy.—Parker applied a snug compression bandage to the arm in 50 consecutive patients who were subjected to radical mastectomy in the course of the last three years. This bandage was left in place for eight weeks. The arm is bound to the chest by a fied Velpeau bandage until the fourth postoperative day, w the elastic compression bandage is applied. The extre wrapped from the distal flexor crease of the palm to as hi the breast dressing will permit. The bandage must be ap snugly enough to prevent any subsequent swelling or to eli ate any early postoperative edema. Some of the earlier pati have now been followed for three years or longer and in instance did noticeable swelling of the arm occur in those w wore the bandage continuously during the eight-week pe In two patients, who inadvertently removed the bandage a four and five weeks respectively, edema of the arm deve This substantiates the assumption that there is a critical pe of approximately eight weeks, when compression band of the arm will prevent the development of edema.

Effects of Electric Currents on Canine Heart: Ventric brillation.—Studies were undertaken to investigate some effects of electric currents on the canine heart with pa reference to ventricular fibrillation. Another aim was t mine the optimal current or currents required to stop v lar fibrillation and to examine the range of currents tha produce and stop this arrhythmia. It was hoped that the of a more useful and effective defibrillation apparatus c obtained. Observations were also made on the effects operatively administered quinidine on the production a sation of ventricular fibrillation. Approximately 500 alte current electric shocks of varying intensity and duratio applied across the exposed heart of 16 dogs. The aver sistance of the dog's heart was found to range from 4 ohms, with an over-all average of 51 ohms. This resista found to depend on the applied voltage, on the ampera somewhat on the duration of the impulse. It was found t rents of low value need be of long duration to produce tion, while currents of high value can be of either short duration to stop ventricular fibrillation. Currents varyi 0.09 to 0.4 amp. induced ventricular fibrillation but in stance produced defibrillation. Currents of 1.5 to 3. stopped fibrillation, and in no instance did they induce change from a fibrillating to a defibrillating current va found to occur at about 1 amp. A series of three to five A. C. shocks of 0.1 second duration applied at 0.5 to 1.0 intervals seemed to produce the optimum defibrillating authors describe a practical defibrillating unit devised on asis of their experimental data. The preoperative adminis- n of quinidine has proved helpful in decreasing the inci- of ventricular fibrillation and in facilitating defibrillation.

t of Rh-Positive Fetus on Maternal Rh Antibody Titer.— ntibody titrations were carried out on 65 sensitized Rh- ive pregnant women carrying Rh-positive fetuses. Consid- that a rise in antibody titer antenatally could result only a leakage of fetal blood into the maternal circulation, ob- tions indicated that such a leakage occurs in about one f every three or four normal pregnancies. Determinations h antibody titer in 56 cases two weeks after the delivery as as antenatally revealed that fetal blood leaks into the ma- l circulation in about one out of three deliveries. Since ximately 40% of Rh-negative persons can be sensitized by njections of Rh-positive blood spaced four months apart, be calculated that in Rh-negative women who have re- d a previous injection of Rh-positive blood there is about nce in 12 or 13 that the first baby will be erythroblastotic. omen who have never received any injection of blood that sensitize them, the chance that the first baby will be roblastotic is negligible, because for this to occur it would ecessary for blood to leak into the maternal circulation atally on at least two occasions spaced four months apart, to prime the patient and the second time to stimulate the rance of antibodies. This never occurred in the authors' of cases. It was also calculated that in Rh-negative pri- as who have never received an injection of Rh-positive the chance of Rh antibodies appearing after the birth of h-positive baby is approximately 2 out of 45; other inves- rs reported an occurrence in 2 out of 65. It was further lated that in Rh-negative women who had never received jection of Rh-positive blood, the chance of their second being erythroblastotic is about 1 in 20, which agrees well the clinical observations. Five cases are described in detail der to illustrate the value of periodic antenatal Rh antibody ions in the management of sensitized Rh-negative women.

stance of Rh Antibodies in Serum of Sensitized Persons. riodic Rh antibody titrations were carried out over a d of one to four years in 60 sensitized Rh-negative women, e absence of additional exposure to Rh antigen. Results ed that once a person has become sensitized to the Rh r, Rh antibodies are demonstrable in the serum for periods least four years, provided that the techniques used are iently sensitive, such as the tests with enzyme-treated cells. veral of these women the history indicated that Rh sensi- ion had occurred many years previously, without any er exposure to the Rh antigen. A case is reported in which odies were found in the serum of an Rh-negative woman had never received an injection of blood and who had had last pregnancy 22 years previously. The authors' observa- suggest that, once a person has become sensitized to the actor, the antibodies persist in the body for the remainder e person's life.

Corticotropin and Cortisone in Leukemia and Leukosarcoma.—Forty-two patients with various diseases of leukocytic proliferation were treated with one or more courses of corticotropin (ACTH) or cortisone. Corticotropin was given to adults in doses of 15 or 20 mg. subcutaneously every six to eight hours; smaller doses were used in children. The dosage of cortisone ranged from 100 to 150 mg. daily, either intramuscularly or orally. Of 15 patients with acute or subacute lymphocytic leukemia, 2 died after only a few days of the institution of treatment, while of the remaining 13 who received adequate courses of treatment, there was objective and hematological evidence of well-defined remissions lasting 1 to 10 weeks in 9 (69%). Retreatment produced further remissions, but an eventual state of refractoriness was reached. Treatment must be intensive and prolonged. Of five patients with acute granulocytic leukemia, only one showed a slight clinical improvement with therapy. An actual acceleration of the process occurred in two patients. Two patients with acute monocytic leukemia did not respond to the treatment, and death seemed to be hastened. Of five patients with chronic lymphocytic leukemia, four were distinctly improved, particularly those with terminal leukemia with anemia, exfoliative dermatitis, or symptomatic hemolytic anemia. Of five patients with lymphosarcoma, all showed some degree of improvement. Features benefited were enlargement of liver, spleen or lymph nodes, symptomatic hemolytic anemia, and anemia. Of five patients with terminal Hodgkin's disease, three were notably benefited, particularly with respect to constitutional symptoms. There was, however, no fundamental alteration of the disease process. Only one of the five patients with multiple myeloma responded favorably to treatment; hyperglobulinemia and Bence-Jones proteinuria decreased to a variable extent in all patients with these symptoms. Undesirable effects of corticotropin therapy included psychoses, fluid retention, hypertension, convulsions, porcine obesity, acne, hirsutism, and diabetes mellitus. The relief of anemia, thrombopenia and leukopenia often brought about by corticotropin therapy suggests that in contradistinction to other forms of therapy in white blood cell proliferations, corticotropin stimulates rather than depresses the bone marrow. This is advantageous in the treatment of patients with deficient bone marrow, whether this deficiency may be due to the primary disease or previous therapy. The final evaluation of the place of corticotropin in the treatment of the various proliferative diseases of the leukopoietic tissues remains to be established.

Pituitary Cretinism.—Dunn reports a case of pituitary cretinism in a girl aged 10½ years, and describes her therapeutic response to four and a half years' administration of oral anterior pituitary, thyroxin, and calcium glycerophosphate. In pituitary cretinism the cretinic facies and other constitutional and functional signs of severe hypothyroidism are the result of an anterior pituitary thyrotropic deficiency. The thyroid is free from pathological changes. Its secreting cells are small but functionally dormant because they are not being stimulated by the thyrotropic factor. The pituitary disturbance is presumed to be due to a cystic lesion, since the pituitary is enlarged equally in all diameters and there is no erosion of the enlarged sella turcica. Pituitary cretinism can be distinguished from thyroid cretinism by the roentgenologically enlarged sella turcica in the former, and the combination of pituitary infantilism, myxedema, and a mental development above that of the average thyroid cretin. This differentiation is important because of: (1) the greater degree of physical, sexual, mental, social, and economic development obtainable in pituitary cretinism from adequate anterior pituitary and thyroid therapy as compared to thyroid therapy alone, and (2) the greater tolerance of the thyroid cretin for thyroid extract. Doses well tolerated by the thyroid cretin have produced thyrotoxic reactions in all seven cases of pituitary cretinism seen by the author.

*Effect of Prolonged Motionless Standing on Phases of Cardiac Cycle, Stroke Volumes, and Posterior-Anterior Diameters of Heart as Studied by Electrokymograph. E. E. Eddleman Jr., K. Willis and H. E. Heyer.—p. 156.

Effect on Heart of Prolonged Motionless Standing.—Electrokymographic studies were made on four normal male subjects standing motionless for 16 to 30 minutes. Apparent stroke volumes, posterior-anterior cardiac diameters, blood pressure, and phases of the cardiac cycle were determined at mately three-minute intervals until syncope. There were ently three stages in the physiological response to standing. First, there was a decrease in stroke volume diac posterior-anterior diameters during the first 4 to 12 probably the result of pooling of blood in the legs. there was a temporary rise in the stroke volume associated an increase in posterior-anterior cardiac diameters. Third, posterior-anterior cardiac diameters continued to increase a decline in stroke volume until syncope ensued. The mean pressure was maintained until the abrupt onset of syncope.

Effects of p-Hydroxypropiophenone.—The effect of *p*-hy propiophenone on thyroid function was studied in 120 male rats and 40 3-day-old chicks. Of the 120 rats, 40 were a low-iodine diet, and 5 to 100 mg. of *p*-hydroxypropiop was injected subcutaneously as a saline suspension in these animals, once a day for 10 days. Ten untreated a served as controls. A second group of 40 rats were given laboratory food and 0.1% thiouracil in their drinking wa ese 40 animals, 30 were given 5 mg. to 100 mg. of *p*-hydroxy- opiophenone daily, while 10 with no injections served as con- ols. The third group of 40 rats were given a low-iodine diet, and of them received *p*-hydroxypropiophenone mixed in this od and/or 0.1% thiouracil in the drinking water. Thiouracil is withdrawn from the animals 48 hours before autopsy. The [illegible] was given for 10 days. Of 40 baby [illegible] diet, 30 were given *p*-hydroxypropio- enone and/or thiouracil in the diet. Twenty-four hours before topsy all animals were given 1 μc of carrier-free radioactive dine (I^{131}) intraperitoneally. Oral or parenteral administration rats on a low-iodine diet decreased the collection of I^{131} by thyroid. The compound failed to inhibit the formation of goiter in animals treated with thiouracil. Adrenal weights of rats receiving *p*-hydroxypropiophenone orally or paren- ally were increased. Pituitary gland weights of the rats were t significantly changed from control values. Results of these periments on rats and chicks indicated that whether given lly or parenterally the drug fails to change the response of thyroid to thiouracil treatment. It is concluded that *p*-hy- oxypropiophenone is not a specific inhibitor of pituitary rmones.

tihistaminics for Auricular Fibrillation.—Clinical experience th quinidine in the therapy of auricular fibrillation indicated a ed for a substitute that may be used intravenously, will not luce marked hypotension, and, in itself, will not cause ven- cular arrhythmias. McCawley and associates had demon- ated in previous experiments that the benzhydryl ether anti- taminics prevent ventricular arrhythmias in animals. On the sis of these experiments they used these compounds in thera- utic trials in clinical auricular fibrillation. They used the iso- ed auricle technique of Dawes to study the action of a series antihistamine compounds on the myocardial refractory riod. The antihistaminics studied prolonged the refractory riod at concentrations lower than that required by quinidine. brillation or flutter was initiated in the isolated auricle prepara- on by a localized traumatic infarct or by aconitine. It was und that quinidine and diphenhydramine can produce a sud- n conversion to a slow rhythm in these preparations. The thors feel that a variety of experimental techniques must be plied to this potentially useful antifibrillatory drug before it n be given a clinical trial. The present knowledge concerning e genesis of clinical auricular fibrillation is insufficient to per- it selection in one alteration of critical function of the auricle r study with antifibrillatory agents. Diphenhydramine seems orthy of clinical trial in patients with auricular fibrillation.

Translumbar Nephrocolopexy.—Translumbar nephrocolopexy was performed on 67 women between the ages of 20 and 45 and weighing between 80 and 110 lb. (36.3 to 49.9 kg.) with nephroptosis. Preoperative study of these patients revealed that they were nervous persons and that their usual complaints, besides the cardinal symptom of nephralgia, were loss of weight, gastric distress, constipation, and loss of appetite. It was observed that nephroptosis is not uncommonly associated with enteroptosis or a downward displacement of the colon, particularly in women, in whom these conditions are more prevalent. The usual lumbar incision was made, and the Lowsley ribbon gut technique was employed for the nephropexy. After this procedure, the peritoneum was opened, the appendix removed, and the anterior band of the ascending colon at the level of the hepatic angle sutured to the superior angle of the peritoneal wound and to the ribbon gut at the inferior pole of the kidney. Postoperative follow-up showed that all the patients were improved clinically, as shown by the absence of symptoms and by gain in weight ranging from 11 to 45 lb. (5.0 to 20.4 kg.).

Urologic Status of Wartime Paraplegics.—Of 170 paraplegic patients with spinal cord injuries resulting in neurogenic bladder, 85 were injured during or before World War II. Considering the entire group, an average of 4.04 years had elapsed since the injury was sustained. Of the 170 patients, 142 had a voiding trial and 28 for one or another reason did not. Of the 142 patients, 73 had only mild disturbances of bladder function, with emptying no oftener than every two hours, and 69 had severe disturbances. Of the 142, 19 had cervical lesions, and 12 of these (63%) had relatively good bladder function, 60 had dorsal lesions, and only 22 of these (37%) had relatively good function, while of the 63 with lumbrosacral lesions, 39 (62%) had relatively good function. Thus, the condition of patients with lower cord lesions was as good as or better than those with higher cord lesions. Of 82 patients whose bladders were drained by urethral catheters during the period of spinal shock, the bladders eventually showed relatively good function in 49 (60%), while of 51 similar patients whose bladders were drained by suprapubic catheters, in only 18 (35%) was there clinically good function. It was concluded that urethral drainage offers a better opportunity for bladder recovery than does suprapubic drainage. Analysis of factors responsible for the failure of the paralyzed bladder to regain its function in 69 of the 142 patients revealed that peripheral spasm and contracted bladders were the commonest causes for this failure. Other factors included lower urinary tract complications. A study of the changes occurring in the upper urinary tracts of the paraplegic patients with the passage of time showed that changes, as judged by hydronephrosis, hydro-ureter, and calycectasis, rose rapidly during the first 24 months and then tended to level off. Functional damage, as judged by excretory urography, was not pronounced during the first three years but then increased rapidly. Causative factors, such as stones and infections, were common during the first two years and then became less and less important. The curve plotting their incidence followed closely the curves denoting anatomic damage to the kidneys and ureter. The incidence of vesical ureteral reflux was not great until the end of the third year, and then it rose sharply, paralleling closely the curve denoting loss of renal function. It was also noted that more damage to the upper urinary tract occurs in patients whose bladders function poorly.

Herpangina, a Specific Infectious Disease.—A disease entity characterized by fever with vesicular or ulcerated throat lesions and chiefly affecting children has been prevalent in the District of Columbia and its environs for many summers. Physicians agreed that the disease was highly contagious and usually ran a benign, self-limited course. It is now apparent that this disease is herpangina, a specific entity described by Zahorsky in 1920. Studies on a possible virus etiology were begun by Huebner, who succeeded in isolating viruses of the Coxsackie group A from both throat washings and stools. The present study was carried out in the outpatient department of the Children's Hospital in Washington, D. C. All children with fever and pharyngitis examined, and those with the characteristic vesicular or ated lesions in the throat were further studied. Labor studies included throat and stool cultures for predomi bacterial organisms, throat and anal swab and stool speci for virus isolation, venous blood for virus-antibody determi tions, white blood cell and differential counts. Each patient seen at two-day intervals thereafter, until the illness had subsi A second blood specimen was drawn for convalescent antibo assay 10 to 20 days after the onset of illness. The ages of 22 patients ranged from 6 months to 8 years. There was a re tively high incidence in siblings (8 of 22). The authors present case report illustrating the course of herpangina. Viruses recovered in 19 of the 22 cases and showed four immunologi *distinct strains among group A Coxsackie viruses.* Neutrali antibodies against homologous strains of virus were present all convalescent serums, and a rise in titer was demonstra during illness in 70% of cases.

Cortisone in Aerosol Form.—Gelfand presents observations five patients with bronchial asthma of the mixed variety (trinsic and extrinsic bronchial asthma) treated with cortisone aerosol form. The method of dilution was similar to that gested by Reeder and Mackey—1 cc. of cortisone mixed wi cc. of isotonic sodium chloride solution. The dosage was 1 of *this mixture, inhaled* every hour for a period of 10 ho daily, a total of 50 mg. per day. Treatment lasted two wee with beneficial effect in four out of five cases. The patient *responded unfavorably* was a 65-year-old woman who severe emphysema and pulmonary fibrosis. Relapses occur in three of the four successfully treated cases after the fo to fifth day following the cessation of therapy. Administra of the drug in a similar manner for another 10 days to *weeks, however, again produced amelioration* of sympto The dosage employed was considerably less than that reco mended by other authorities; however, since relapses have b noted by many writers, even after the administration of la amounts over longer periods of time, low dosage cannot be cause of the relapses in these cases. The exact optimal dos cortisone is not known; it depends on the severity of the dis rather than on the age and weight of the patient. The opti *dose is the one that is capable of controlling the clinical* co tion without producing undesirable side-effects. Since the br chospasm in the above cases was relieved by 50 mg. of nebuli cortisone without metabolic alterations, it may be assumed 50 mg. given in aerosol form constituted the optimal dos in four of the five patients treated.

valuating Drug Therapy of Parkinsonism.—The personality ttern and suggestibility of the patient with Parkinsonism, as ell as unintentional suggestive influences of the investigator aluating new drugs for the treatment of this disease, freently make the latter's task difficult. A review of the literature monstrates that the first favorable reports usually cannot be nfirmed by subsequent investigators. The literature on caraiphen hydrochloride ("panparnit") shows a gradual decline in e percentage figures for favorable results from 100 to 0. The thor's experience with this drug is limited to five patients with stencephalitic Parkinsonism previously stabilized over a riod of years with optimal doses of a compound of belladonna kaloids (rabellon®) and requesting a trial with caramiphen drochloride. None of these patients was improved. All owed increased tremor and returned to their previous medican with the belladonna alkaloids. In 10 patients, 7 with postcephalitic Parkinsonism, 2 with idiopathic and 1 with arteriolerotic Parkinsonism, the belladonna alkaloids were slowly ithdrawn, while 3-(1-piperidyl)-1-phenyl-1-cyclohexyl-1-pronol hydrochloride (artane®) was substituted in increasing nounts, until the optimal dose was reached. None of the paents was objectively improved with artane® as compared to e belladonna alkaloids. Artane® seemed to be less effective than e latter drug in the control of tremor, and its disagreeable ntral nervous system side-effects, leading to confusion, disrientation, and delirium, are not negligible. To avoid erroneous nclusions in the clinical evaluation of a new drug several facrs should be taken into consideration: 1. Patients previously eated with adequate doses of an effective drug are frequently ut only temporarily "improved" by changing to a new even ss effective drug. 2. A skeptical attitude in presenting a new eatment to the patient may psychologically interfere with an bjective improvement attainable by an effective drug. 3. Psychoenic, subjective improvement may, perhaps through hypohalamic mediation, favorably influence the objective symptoms oo, but such improvement may be maintained for only a limted period. 4. Subjective improvement may be regarded as a eal therapeutic success in Parkinsonism but cannot justifiably e ascribed to the pharmacologic action of a drug, unless it is ccompanied by objective and sustained improvement of the eurological symptoms.

Segmental Gastric Resection for Peptic Ulcer.—For many years surgeons have done a three-quarter gastric resection for peptic ulcer in which the entire gastrin-containing area of the stomach along with a large segment of the acid-secreting area is excised. In order to overcome some of the limitations of these methods, it was proposed to reverse the usual procedure of gastric resection by leaving an antrum intact, excising a larger fragment of the acid-secreting area, and leaving not more than 10% nor less than 5% of the total gastric area in the fundic segment. Diminution of acid secretion is then assured, and optimal conditions are afforded for neutralization and digestion by bile and pancreatic juice. Moreover, it was hoped that segmental gastric resection might obviate some of the problems of the dumping syndrome. Experiments on dogs revealed that an extensive segmental gastric resection, in which 74% of the acid-secreting portion of the stomach by weight is excised, leaving 10% of the entire stomach as the upper fundic pouch anastomosed to the antrum, will protect against the ulcer caused by histamine in beeswax in the dog. A segmental resection in which 25% of the stomach by weight is left as the fundic pouch will not protect against the histamine in beeswax ulcer, whether or not a complemental vagotomy is done.

Antireticular Cytotoxic Serum.—Gardner and Speaker review the extensive literature on the antireticular cytotoxic serum (ACS) of Bogomolets and find that it has only been partially investigated in the United States. The effects of the serum, both cytotoxic for large doses and stimulating for small doses, have been verified by tissue culture techniques. The stimulating effects in wound and fracture healing have been verified. The relief of pain in human cancer and the suppression of the Brown-Pearce carcinoma in the rabbit have been demonstrated. The suppression of rickettsia in animals has been verified. Improvements in the preparation of the serum have been accomplished, and the optimum stimulating dosage level has been established at 0.1 to 0.15 BU (Bogomolets unit) per kilogram of weight, given in a single dose and repeated about every three weeks in man and every two to three weeks in mice, rats, dogs, guinea gs, and rabbits. Antireticular cytotoxic serum has been consively demonstrated to have little, if any, value in the treatent of arthritis. The possible use of antireticular cytotoxic serum as an anti-aging agent has not been investigated in America. Bogomolets' hypothesis about the role of the recticuloendothelial system has been neither proved nor disproved. However, the possible practical clinical value of antireticular cytotoxic serum does not depend on the strength of this hypothesis. It may be established or refuted independently. Further investigation is recommended to enlarge the possible field of use of antireticular cytotoxic serum and to facilitate the practical development and production of the serum, should this be warranted on the basis of successful clinical trials.

Adrenal Cortical Steroids and Antibodies in Irradiated Animals.—The detrimental effects of roentgen irradiation on antibody production are well known. This paper deals with the effects of adrenal cortical extracts as well as stimulating doses of specific antigen on circulating antibody titers in irradiated animals previously immunized against Salmonella typhosa. In the first experiment, rabbits which received stimulating doses of antigen during the 21-day observation period responded with slight increases in antibody titers. Those receiving no stimulating doses showed no regular antibody changes. Animals receiving adrenal cortical extract at selected intervals following immunization showed no significant changes as compared to controls, whereas, in those given 500 r whole body roentgen irradiation, without follow-up stimulating antigen, circulating antibody titers decreased. The administration of adrenal cortical extract to irradiated animals resulted in a significant maintenance of antibody titers for most of the treatment period. Similarly, animals given a stimulating dose of antigen immediately before irradiation appeared better able to maintain their antibody titers than irradiated animals without the stimulating doses of antigen. In the second experiment two treatment factors were used in rabbits previously immunized against Salmonella typhosa: roentgen irradiation and adrenal cortical extract. Repeated postra doses of adrenal cortical extract maintained antibody titers nificantly higher than in those irradiated animals that did have the extract. These data indicate that it is possible to the usual course of antibody response following whole bo ionizing radiation injury and that, in the irradiated animal, cir lating antibodies may be increased by giving adrenal corti extract after irradiation.

Antidiuretic Activity of Serum in Hypertension.—The exp mental production of hypertension by administration of post pituitary preparations indicates that this gland might play a p in human hypertension. Since the neurohypophysis is under t influence of hypothalamic centers, the authors thought that d ferences in antidiuretic activity of serum could be detected b tween the neurogenic and established phases of essen hypertension. Serums of 16 women with "neurogenic" hyp tension and 12 patients with established essential hyperten were studied. The serums of 14 subjects with normal blood p sure served as controls. The tables recording the results of t tests on the three groups of persons reveal that, while nor serum caused a water retention ranging from 1.7 to 4.5 ml. p 100 gm. of body weight (average 2.4) with only one case ab 2.7, neurogenic hypertensive serum caused a retention from to 4.6 (average 3.2) with only three values below 2.7. Establis essential hypertension produced a retention of 2.6 to 4.3 (a age 3.5), with only one value below 2.7. The authors concl that even normal serum has antidiuretic activity when compa with isotonic solution of sodium chloride, but the water re tion caused by the serums of patients with essential hyperten was significantly higher than that produced by normal ser independently of the neurogenic character of the disease.

Visceral Lesions of Scleroderma.—In recent years numer studies have appeared describing involvement of organs o than the skin in patients with scleroderma and emphasizing fact that scleroderma is a generalized systemic disease. cause of scleroderma is unknown, but the frequent associa of scleroderma with Raynaud's phenomenon has suggested vasospasm may be a primary event. However, this factor is demonstrable in a large proportion of cases of scleroderma. in cases in which manifestations of Raynaud's disease are p ent, they often follow rather than precede hardening of the s It seems likely that scleroderma results from some cause affects connective tissue throughout the body. Some obser have separated a group of patients with scleroderma of a which they designate acrosclerosis. In these patients, Rayna phenomenon is prominent, and skin changes are confined lar to the face, chest, and extremities. Scars of unusual type inv ing the myocardium have been described in scleroderma. Th differ from those caused by vascular disease in that they are found in the arteries. The lesions are characterized as focal o growth of fibrous tissue, with secondary destruction of o myocardial structures. In addition, there is pericardial and endocardial fibrosis. Cystic sclerosis and compact pulmon sclerosis are the two types of pulmonary lesions that are fo in patients with scleroderma. In the digestive tract, atroph the muscular layers and replacement by fibrous tissue are changes characteristic of scleroderma. The esophagus app to be most frequently affected, but similar changes have b observed in the walls of the alimentary canal throughout course. Although scleroderma is relatively uncommon, invo ment of structures other than the skin is frequent. Seven nine patients had symptoms pointing to cardiac, pulmonary digestive involvement, and two showed evidence that all t systems were affected. Visceral changes may constitute the m serious aspect of the disease.

urrence in Inguinal Hernia.—Borgström reviews observa-
s on men over 25 who were operated on for unilateral, re-
ible, acquired inguinal hernia at the Surgical Clinic in Lund
r the 13 year period from 1936 to 1948 inclusive. Question-
es were sent to 980 patients who had had no immediate
operative complications. Fifty-six had died, and an addi-
al 180 failed to answer the questionnaire, so that 744 cases
ld be evaluated. Recurrences were reported by 88 of the
ents, and over half of these occurred within the first year.
patient's age and weight at the time of operation played no
in the recurrence. Patients doing manual work on the
le had a lower recurrence rate; however, their recurrence
rose with the size of the hernia, which was not the case in
nonmanual workers, whose over-all recurrence rate was
ner. When the plastic repair of muscle was done ventrally
he cord and the latter was taken out medially, the recur-
ce rate seemed lower than when the repair was done dorsally
he cord and the latter was led out laterally. Furthermore,
skill of the surgeon seemed to influence the recurrence rate,
hat patients who had a less experienced surgeon had a higher
. In evaluating the influence of postoperative recumbency
recurrence, only those in whom the recurrence followed the
ration within a year were considered. Recurrence was high-
in those whose postoperative recumbency was less than three
s. Since the period of hospitalization in these patients was
one day shorter (5.6 compared to 6.6) than in those who
e recumbent three or more days, the shortening of post-
rative recumbency after hernia operations does not imply
eat saving in hospital beds. Nor did shortened periods of
mbency and hospitalization result in a corresponding re-
tion in the period of convalescence. The recurrence rate in-
sed with the length of the convalescence period, the lowest
rrence rate being observed in those whose period of con-
scence was at the most four weeks.

dullary Nailing.—The 182 cases in which medullary nailing
done at a Stockholm hospital between 1944 and 1950 in-
led cases of fracture of the femur, tibia, humerus, radius,
a, metacarpus, and clavicle. The one death cannot be at-
uted to the method. Two cases of pulmonary fat embolism
one case of thrombosis occurred, all in femoral fractures.
the basis of a review of the technical problems and of the
plications encountered in these cases, Palmer stresses the
owing points: 1. The method requires great technical ex-
ience and should not be attempted by those who only occa-
nally deal with fractures. 2. Medullary nailing should be used
y in cases in which it promises good results; comminuted
ctures or those close to a joint are not suited for this treat-
nt. 3. Open reduction is preferable to tedious methods of
sed reduction. 4. The nail should never be driven in with
ce. It should be removed and replaced by a new one if diffi-
ty is encountered in inserting it. 5. In femoral fractures the
l should be driven in from the tip of the trochanter after
eful determination of the direction. 6. Diastasis should be
oided. 7. A nail that bends should be replaced with a new
e, at least in femoral fractures. The fracture should be ex-
ored and bone chips inserted if union is delayed. Improvised
unsuitable nails or nails not made of absolutely reliable ma-
ial should never be used. The nail should be equipped with
extraction hole for removal.

*Fibrocystic Disease of Pancreas, Disorder of Autonomic Nervous System. H. Bergstrand.—p. 349.

Fibrocystic Disease of Pancreas.—The occurrence of cystic fibrosis of the pancreas is reported in two female infants. The first patient died at the age of 7 weeks and the second at the age of 20 months. In the first, necropsy revealed agenesis of the ganglion cells in the distal ileum and in the entire colon and rectum. No Paneth cells were present in the small intestine. The mucosal glands were not visibly distended but contained round concrements of inspissated secretion, the central parts of which stained like calcium salts. The intestinal contents included many concrements of this kind. The pancreas showed, as in other early cases, only minor lesions; the large ducts were not dilated, but the lumen of the small ducts and the acini contained acidophilic, inspissated, partly lamellated secretion and were dilated. In the second case, microscopic examination did not reveal any abnormalities of the sympathetic nervous system. As in some previously described cases, the mucous glands of the respiratory tract were distended and contained inspissated secretion, but goblet cells were almost absent. The microscopic appearance of the lungs did not resemble that in asthma, a disease in which the parasympathetic nervous system has been considered as overstimulated. The parenchyma of the pancreas was largely replaced by connective tissue, and only a few dilated ducts and acini were present. The cells of the epithelial lining were flattened, and the lumen contained varying amounts of laminated material that stained like mucus and occasionally like fibrin. These two cases strongly support Farber's concept that the basic disorder in cystic fibrosis of the pancreas is an imbalance of the autonomic nervous system. In contrast to Farber, the author considers the disorder as a dysfunction or hypofunction rather than a hyperfunction of the parasympathetic nervous system.

Seasonal Changes in Sensitivity of Toad to Gonadotropic Hormone.—In Finland, where the African toad, Xenopus laevis, has been used widely for pregnancy tests since 1947, it was observed that particularly during the winter false negative pregnancy reactions resulted in some cases. Since Swiss investigators had observed a similar tendency on the part of this toad, Toivonen and his collaborators investigated the seasonal fluctuations of the reaction threshold of this toad to gonadotropic hormone. Every month, for a year, they tested the reaction threshold of Xenopus laevis toads with a chorionic gonadotropic hormone preparation. They found that the reaction susceptibility of the toads fluctuated with the seasons in a ratio of 2:3, which is about the same as had been observed in Switzerland, 1,600 international units of hormone being the reaction threshold in the winter and 1,000 units in the summer, although the seasonal differences in the hours of daylight are greater in Finland. The threshold of sensitivity is also dependent on the body weight of the adult toad. If the weight of two animals stands in a relation of 1:2, then the amount of hormones required for ovulation are in a ratio of 1 to 3 or 4. For this reason the authors recommend that during the fall and winter smaller toads should be used for the pregnancy test. The quantity of hormone injected determines the number of eggs deposited.

*The Fate of Patients with Arteritis. K. Denecke.—p. 506.
Surgical Treatment of Fractures of the Base of the Skull. W. Dressler. —p. 518.

Fate of Patients with Arteritis.—It has been demonstrated that endarteritis is an inflammatory process. Denecke prefers the term arteritis to endarteritis, because all layers of the arterial wall, rather than only the intima, are involved. He investigated the fate of 96 of a total of 200 patients with arteritis of the extremities in whom the disease had begun at least five years previously. He found that 26% had died of the disease and 30% had undergone amputation, some on both sides. The symptoms subsided in only 5% after a relatively short time and without loss of members. In comparing those who received conservative treatment with those who were subjected to lumbar sympathectomy, no difference could be noted in the course. Apparently, surgical intervention on the sympathetic exerts no decisive influence. The limited effectiveness and the fact that disturbances in sexual function often result from sympathectomy further restrict the indications for sympathectomy in arteritis. Patients who were subjected to amputation early, when only one of the extremities was involved, obtained freedom from symptoms in a high percentage of cases, and none of them died. Thus amputation seems advisable for larger numbers of cases in the early stages, at least until more effective therapy is available. The course of the disorder seems to a large extent to be predestined. In approximately one-half of the patients gangrene does not develop, even over periods of from 20 to 30 years. This observation makes the use of the terms "early" and "late" rather meaningless. It would be better to differentiate between the florid, acute stage and the stage of cicatrization. In approximately 10 to 20% of the patients the disease assumes a generalized form from the beginning, and in these cases it is always fatal. It remains to be seen whether cortisone or corticotropin will produce a fundamental change in the treatment.

*Vitamin B₆ (Pyridoxine Hydrochloride) in Diseases of Peripheral Nervous System. G. J. Fernández.—p. 141.
*Reflex Lung: Experimental, Traumatic and Postoperative. Dramatic Reflex of Capillaries of Lung. Experiments Reproducing Clinical Findings. C. Stajano and J. J. Scandroglio.—p. 209.

Vitamin B_6 in Diseases of Peripheral Nervous System.—Vitamin B_6 (pyridoxine hydrochloride) was administered to 17 patients of either sex with diseases of the peripheral nerves including sciatica, facial neuralgia, peripheral facial paralysis, polyradiculoneuritis, acute poliomyelitis, and polyneuritis. The drug was given parenterally in doses of 25 to 50 mg., either daily or every other day for a period of one to three months. The tolerance of the patients to the drug was excellent. The drug when administered either alone or in association with thiamine or any of the drugs commonly used for disease of this type gave good results in all cases, with rapid regression of the disease, control of muscular pain and amyotrophy, and gain of muscular tonicity. In cases of facial paralysis the earlier the administration of pyridoxine hydrochloride the better the results. In diseases of long duration the treatment failed.

Reflex Postoperative Pulmonary Congestion.—According to Stajano and Scandroglio, the pulmonary congestion associated with diseases of the gallbladder, the biliary tree, and the pancreas, as well as that which follows abdominal surgery, is due to a violent bronchopulmonary response to abdominovisc
pathetic reflexes. The response consists in massive vaso
in single or multiple segments of the lung, with co
exudation of plasma and diapedesis of red blood cells
interalveolar septa and into the alveoli, which become
or completely obliterated. In a large group of dogs the
experimentally produced (1) acute distention of the gall
and of the biliary tree, (2) acute artificial edema of the pa
and (3) prolonged and repeated traction on the mesentery
small intestine. A control series of animals had the same
tions as those of the animals in the experiments, but
trauma of the abdominal viscera. All the animals were
45 minutes after the maneuvers. Whereas the lungs of the
trols were macroscopically and microscopically normal,
of the dogs subjected to visceral trauma showed the afo
tioned congestion, edema, hemorrhage, and consolidatio
authors conclude that the results of the experiment supp
theory of the neurovascular origin of transient atelectasis
pulmonary congestion appearing in the first day after abd
surgery.

ım **Gamma-Resorcylate in Rheumatic Fever.**—Salicylic has a therapeutic action in rheumatic fever, yet its isomers, netahydroxybenzoic and parahydroxybenzoic acids, are in- e. In an attempt to explain this difference in action, the iochemical properties of salicylic acid and its isomers were pared. Results showed that salicylic acid has the ability to an additional or chelate ring, while this property is not essed by the isomers. The possibility that the therapeutic n of salicylic acid may depend on chelate ring formation examined by studying the antirheumatic action of the mono- ım of 2:6-dyhydroxybenzoic acid, referred to as gamma- cylate, in seven patients with rheumatic fever. Gamma- cylic acid was selected because it can form a double chelate and consequently is a much stronger acid than salicylic Six of the seven patients received amounts varying from m. in 3 days to 10 gm. in 10 days, an average of 0.8 gm. day. The seventh patient, a man weighing 224 lb. (101.6 was given the comparatively large dose of 7 gm. per day our days. The average dose in the six patients was thus t one-tenth of the usual therapeutic dose of salicylate, and mount given to the seventh patient was about equal to that licylate. Oral administration of the drug was followed by f of acute arthritis and by a fall in temperature and pulse Minor joint and muscle pains developed after the third of treatment in five patients. About the same time, emo- l instability, mental confusion, slight fever, and a dry tongue observed in four patients. Puffiness of the face, increased growth on the back, and diminished glucose tolerance sug- d a mild Cushing's syndrome in two other patients. In one ıese, pericarditis developed immediately after arthritis had relieved. All these side-effects disappeared after the drug discontinued. After a temporary rise during the first few of administration of the drug, there was a drop in the ırocyte sedimentation rate, and the main biochemical ges were an immediate increase in nitrogen excretion in urine followed later by a chloride and water diuresis. ıma-resorcylate in much smaller doses thus was observed e as effective as salicylic acid in treatment of rheumatic r, but it may have little or no advantage over salicylic acid, eneficial and undesirable effects seem to be equally poten- d. The evidence, though still not conclusive, favors the lusion that the therapeutic action of salicylic acid and ma-resorcylate is related to their common property of chelate formation.

ibiotic **Treatment of Bullous Eruptions.**—Eight patients, e with pemphigus vulgaris, two with pemphigus vegetans, with pemphigus erythematosus, and two with dermatitis etiformis were treated with aureomycin and chlorampheni- (chloromycetin®). A standard dose of 2 gm. daily (0.25 gm. y three hours) was adopted, with an initial dose of 4 gm. ome cases *it seemed advantageous to give double this stand-* dose. Vitamin supplements were given by mouth during the iod of antibiotic administration. In this small series of cases [illegible] aureomycin appeared to influence the production of bullae in both pemphigus vulgaris and bullous dermatitis herpetiformis. The virus etiology of these two diseases is still unproved, and it may be that the action of aureomycin is not against an infective agent but is a direct effect on the cohesion of the cells of the epidermis. In one of the patients with pemphigus vulgaris, nausea and vomiting were a serious complication, and the authors had to choose between a relapse of pemphigus and this distressing gastric upset. In pemphigus vegetans, in which bullae are much less prominent, chloramphenicol appeared to be effective in melting away the vegetating masses at a surprising speed, while in one of the two patients, aureomycin seemed to be ineffective in the dosage given. Response to treatment was usually obtained within a few days. Other observers believe that these antibiotics need to be continued for at least a month to six weeks, if early relapse is to be avoided. Some of the unsuccessful trials of these drugs that have been reported may have been due to either too small dosage or to too short therapeutic trial. None of the authors' cases were complicated by much secondary infection. Treatment was followed by a suppression of the primary lesions of the disease, an effect clearly not due simply to removal of secondary sepsis. The value of smaller maintenance doses as a means of preventing eventual relapse could not be determined, because of yet insufficient supplies of the two drugs.

Radioactive Iodine in Thyrotoxicosis.—This paper presents the results of the treatment of 20 patients with thyrotoxicosis with radioactive iodine (I^{131}). The biological effect on the tissues of the radiation from radioactive iodine is similar to that of x-rays; however, because iodine is in general specifically concentrated in the thyroid gland, it is possible to deliver a very high local dose of radiation. The greater part of the therapeutic effect of radioactive iodine is provided by the beta radiation emitted by the isotope, and, as this does not travel further than 2.2 mm. in tissue, there is little effect on the organs beyond the capsule of *the gland. It was possible to induce a satisfactory remission in* every case, but some required several doses of the isotope. Larger doses were needed for toxic nodular goiter than for Graves' disease. A technique is described by which the gland size may be accurately determined and precise dosage of radiation calculated. Induction of malignancy in the gland as a result of internal radiation is improbable, and the immediate advantages of this form of treatment in many cases outweigh the remote risks of malignant change. The simplicity, safety, efficiency, and lack of immediate complications of radioactive iodine therapy make it the treatment of choice for thyrotoxic patients in the older age groups. It is the most satisfactory treatment for all patients in whom thyrotoxicosis has recurred after operation.

The "Mess Trick" and the "Fainting Lark."—In the "mess trick" (played in a mess or at a party) a victim is persuaded to hyperventilate for about a minute and then his chest is suddenly compressed by someone standing behind him. He usually loses consciousness in a few seconds. In the "fainting lark," the boy squats and takes 20 deep breaths, then rises quickly to his feet, closes his nostrils with his fingers (as for inflation of the Eustachian tube by Valsalva's method), and blows hard. He then drops to the ground and "passes out" for a period of about half a minute. In the "mess trick" hyperventilation leads to dilatation of muscle blood vessels and constriction of brain blood vessels. Compression of the chest causes the victim to perform an involuntary Valsalva maneuver, which in the presence of peripheral dilatation is sufficient to reduce effective blood pressure and consequently cerebral blood flow to levels that cause unconsciousness. The mechanism in the fainting lark is essentially the same, except that a voluntary Valsalva replaces the involuntary response to chest compression with the added factor of the fall in blood pressure produced by rising from the squatting posture.

Ganglion Blocking Agent in Treatment of Herpes Zoster.—The ganglion-blocking preparation "pendiomid" (N, N, N'-N'-3-pentamethyl-N, N'-diethyl-3-aza-pentane-1,5-diammonium dibromide), which has a selective blocking effect on the sympathetic and parasympathetic ganglia of the truncus sympathicus, was used successfully by the authors in eight cases of herpes zoster. Pain was relieved, and there was rapid healing of the cutaneous lesions. It is impossible to give a definite dosage scheme for this drug, but the authors feel that it is best to begin with an intramuscular injection of from 40 to 50 mg. Since the drug reduces blood pressure and involves some danger of collapse, careful supervision of blood pressure and pulse rate are required during treatment. By beginning with comparatively low dosage and by increasing the daily dose by 10 or 20 mg. until a total daily dose of 100 mg. has been reached, the authors were able to prevent complications. The total doses given in the cases here reported varied between 300 mg. and 2,450 mg. The duration of treatment also varied. The authors never had to use circulatory stimulants. Toxicologic studies carried out in the laboratory in which this drug was developed revealed that its toxicity was less than that of tetraethylammonium bromide or chloride. Ganglion-blocking drugs like the one discussed here promise to play an important part in the new therapeutic approach to disorders involving disturbances in the sympathetic nervous system, and in which radical surgical interventions such as resection of the sympathetic have been employed.

Male Sex Hormones in Metastasizing Carcinomas of Fe Genitalia.—Seventy-eight female patients with adva metastasizing malignant tumors of the genitalia were g addition to the customary radium and roentgen treatm plantations of testosterone tablets or injections of susp of testosterone. In 52 of the 62 patients in whom eva was possible, definite subjective improvement was observ there was no change and in 2 further deterioration was e In 24 of the patients improvement could also be demo objectively. The unpleasant reaction to irradiation thera lessened or entirely absent. Tumor growth seemed to be in The responsiveness to x-ray treatment seemed to be und and the period of survival seemed to be longer.

Refrigerated Homogenous Bone Grafts.—Results of experi carried out on dogs to compare healing of fresh autog and frozen homogenous bone transplants suggested th autogenous grafts have some advantage over refrigerated h

afts, in that healing takes place more rapidly, but the
ts are the same. Microscopic studies of specimens of
ogenous and refrigerated bone transplants that had
vered at secondary operations from patients in whom
previously been implanted for arthrodesis or other
reported by the author in a previous paper, did not
ificant difference in the rate or method of repair. Re-
homogenous bone transplants were used for 307
s performed on 259 patients up to Jan. 1, 1950. Clini-
in these patients showed the bone to be well tolerated.
of infection in clean cases was 2.6%. Loss of bone
in only two cases. Of the 259 patients, 248 had been
up for six months or longer, making evaluation of
lts possible. Of these 248 patients successful results
ained in 210 (85%). These results were comparable
obtained with autogenous grafts. The healing of can-
ansplants took place more rapidly than with cortical
ansplants that had been preserved for more than one
not heal as well as those that had been preserved for
period, and the failure rate was higher. With long
on there is danger of dehydration, and dried-out speci-
uld not be used. The operation of a bone bank is safe
ical. It offers great advantages to the patient and the
rom the standpoint of availability, abundance, and the
n of the necessity of secondary operations to obtain
en a bone bank is available the number of operations
bone transplants are used will show a sharp increase.

n's Ischemia Complicating Fracture of Femur.—The
e of acute Volkmann's ischemia in the lower extremity
ting fractures of the femur is reported in 13 children.
ght cases reported in detail, there was fracture in the
lf or upper third of the shaft. Treatment of the frac-
isted in application of a Buck's extension and a Thomas
deep boring pain in the central calf area, which was
o control with sedatives and was not influenced very
the release of bandage, was the common feature. A
of numbness soon appeared in the toes and foot and
occasionally upward to the painful calf. This was asso-
ith a stocking type of centripetal anesthesia. All the
lowed a similar pattern. The tender muscle infarcts
l for the calf signs with patchy erythema on the skin
lsations were still present and the leg and foot were
increasing in size. Later on the arterial spasm became
e, resulting in a gradually disappearing pulse and pallor
xtremity. Paralysis was a constant feature and so was
rmly symmetrical return of function in the limbs that
l. The best method of prevention and cure is not only
eness and early recognition with immediate first aid
to release pressure but in addition a widespread re-
vasospasm. Muscle decompression with or without
exploration proved to be of no value. Of the seven
treated with sympathetic block (with a high spinal anes-
x were cured and only one was a therapeutic failure.
on of the calcaneum with a Kirschner wire for trac-
carried out in several cases; it has the advantage of
ng all bandages, suspending the tender calf, and pre-
an equinovarus deformity. Microscopic studies of in-
nuscles were made in several cases. The only essential
e between the histological appearance of muscle that
and that which does not appears to be degeneration
le nuclei. The significance of engorged blood vessels re-
doubtful. Despite the typical gross appearance of an
some regeneration of muscle may occur.

Behavior of Blood Sugar with Insulin Therapy in Patients with Rheumatic Disorders. G. Stepantschitz and E. Kresbach.—p. 549.

Rapid Tests for Determining Resistance to Antibiotics.—Two years ago Walch demonstrated, by means of the phase-difference microscope, morphological changes that had been produced *in gonococci* exposed to penicillin. These changes were demonstrable in stained urethral smears from two to three hours following injection of 200,000 units of penicillin. The same changes that were observable in the gonorrheal pus of a pencillin-treated patient could also be demonstrated on gonococcic cultures. The method employed was somewhat complicated, but by combining it with the method used by Poetschke and Bommer for the observation of living bacteria under the phase-difference microscope, a relatively simple and rapid test for the determination of the resistance to antibiotics was developed. The bottom of a Petri dish is covered with a thin layer of ascitic agar, and a loopful of bacteria is streaked on evenly. Immediately after this, a coverglass is placed over one part of the dish and it is sealed off on the edges with petrolatum. One drop of the antibiotic solution that is to be tested is then dropped onto one or several places on the Petri dish, and coverglasses are also placed over these areas. Then the dish is placed into the incubator at 37 C for up to three hours. At this time microcolonies of all organisms are seen in the area to which no antibiotic has been applied, whereas in the places treated with antibiotic only those organisms show growth that are resistant to the antibiotic in question. A longer period of incubation proved inadvisable, since it caused effacement of the microcolonies so important in the determination. For further corroboration of results, the coverglasses can be lifted off following examination with the phase-difference microscope and the adhering organisms can be stained with the gram or other stains. Illustrations show the results obtainable with this method. With regard to the determination of the concentration of antibiotics required, this method is not so exact as some others, but it is simple and above all rapid; resistance can be ascertained within three or four hours.

Medical Journal of Australia, Sydney

2:1-32 (July 7) 1951

Mortality from Cancers Peculiar to Women.—Lancaster analyzes the mortality of women from cancers of the breast and of the female genitalia on the basis of data in Australian official statistics. He found that these cancers account for an important part of all deaths in women. Cancer of the breast and cancer of the ovaries are both increasing in frequency as a cause of death. At some ages there has been, over the last 40 years, a decline in the mortality from cancer of the uterus. The effect of parity and of conjugal condition on frequency has been noted, it being confirmed that cancer of the ovaries is relatively common among those who have not borne children, cancer of the uterus is commoner among the married, and cancer of the breast is commoner among persons who have never married.

Diffuse Disseminated Platelet Thrombosis.—The name thrombotic thrombopenic purpura or diffuse disseminated platelet thrombosis has been given to a new clinical and pathological entity the principal clinical features of which are a rapid onset with malaise and pyrexia, joint pains, a purpuric rash, hemolytic anemia, and thrombopenia. The disease follows a rapid course, ending with obscure neurological signs followed by death. The essential feature found at autopsy is the presence of platelet thrombi widely disseminated throughout the small arterioles, capillaries, and venules. Two cases of this disease are described, both ending in renal failure, paralysis, and death. Autopsy revealed diffuse disseminated platelet thrombosis in both cases, while one patient also showed histological features resembling polyarteritis nodosa. Although the presence of glomerulitis in this disorder was reported in 1948, it was not previously recognized as a common feature. It was pronounced in both of the cases reported here and was severe enough to produce renal failure in both. Possibly, it is a major feature of the syndrome. Again, as the etiology of this disease is completely unknown, it is perhaps worthy of note that these two cases both began in the same fashion. There was a history of acute infection, of the leg in one case and of the throat in the other case. One of the patients was treated with procaine penicillin, the other with penicillin and a sulfonamide. Although this only suggests an allergic basis of the disease, it is an aspect that should be followed up. It is also suggested that this new disease may be related to the diseases of the diffuse collagen group.

Blood Transfusion into Carotid Artery.—A woman, 35, was admitted to the hospital with pains in the lower abdomen associated with vomiting and fainting. The diagnosis was probable extrauterine pregnancy with the fetal sac growing out into the peritoneal cavity. Urgent intervention was undertaken with the patient under general anesthesia. Hemorrhage was severe. Fifteen minutes later the pulse rate was 160, systolic pressure had dropped to 100 mm. Hg, and the patient's condition had become worse. Injections of a 25% solution of nikethamide and of a commercial adrenal extract and venous blood transfusion were carried out without success. At the end of the operation, which lasted 45 minutes, the patient was in severe shock. The pulse was imperceptible, the breathing superficial, and the skin and mucous membranes were livid. Forty minutes after the operation when heart action and respirations had almost ceased, a blood transfusion was given into the carotid artery in a cranial direction. After introduction of 150 cc. of blood, the pulse beat increased in rate and rhythm, the mucous membranes regained their color, and the systolic pressure was 90 mm. Hg. After introduction of 1,000 cc. of blood the patient left the operating room with full pulse, systolic pressure of 140 mm. Hg, and in good general condition. Thus, blood transfusion into the carotid artery in a cranial direction was the method of choice in this case. The author reports on three additional cases of severe shock due to hemorrhage in which this intervention was performed. The gratifying results obtained confirm the concept advanced several years ago that in instances of severe shock due to hemorrhage in which recovery seems almost impossible resuscitation should be attempted by first supporting
centers rather than the heart, because they are
and more severely from lack of oxygen.

Structural Changes in Anterior Pituitary and Adrenal
by Emotion.—Until very recently psychic trauma
hardly any consideration in the study of the genesis
disease. Selye, however, accepted psychic stimuli as
factors. On the basis of Selye's concepts on the
tion syndrome, Schunk and Cornelius subjected cats
tional stress. One group was exposed daily for two
contact with dogs, which had been trained to annoy
injure the cats. Asthenia, tremors, twitching, and,
end of the three-month period of stress, even atactic
began to develop in the cats. All these signs were
control group of animals not exposed to stress.
trocardiographic studies revealed ventricular
interference dissociation and in one animal signs of
insufficiency. The pituitary and adrenal glands of
of cats were studied histologically. In
controls, all experimental animals showed severe
changes in the pituitary; three of four animals
tion a significant increase in the basophilic cells at
of the chief cells and of the eosinophils, and the
showed atrophy of the lipoid substances, whereas in
animal it was hyperplastic. These findings were
phase of exhaustion or resistance within the scope of
adaptation syndrome.

Heparin to Prevent Coagulation of Pleural
and Long point out that injection of
larly of heparin, into pleural exudates has been studied
ous investigators. Their own studies were designed
to estimate the clinical value of anticoagulants for
as to analyze the conditions that influence coagulation
exudates. Pleural exudates were obtained by the usual
method from two patients with tuberculous pleurisy,
patient with suppurating postpneumonic exudate,
tients with cardiac insufficiency who had a stasis
from one with exudative pleurisy, and from one with
tumor. Pleural exudates and transudates did not
form reaction when heparin or citrate solution were
vitro. There are pleural exudates that coagulate in
the presence of a significant quantity of
tance. It was shown by prothrombin and thrombin
that heparin and a substance known as thrombocid
of reducing the coagulating level of various
pleural exudates seem to lack substances that are
give heparin its full effect in blood or blood
exudates contain titers of thrombokinase or
the in vitro test may eliminate the effect of heparin.
heparin effect becomes evident in such pleural fluids
mal plasma is added, it is probable that the heparin
is inadequate in such exudates. Treatment of pleural
with a combination of anticoagulants may bring

BOOK REVIEWS

harmacologic Principles of Medical Practice: A Textbook on logy and Therapeutics for Medical Students, Physicians and the of the Professions Allied to Medicine. By John C. Krantz, Jr., of Pharmacology, School of Medicine, University of Maryland, and C. Jelleff Carr, Associate Professor of Pharmacology, Medicine, University of Maryland. Second edition. Cloth. $10. with illustrations. Williams & Wilkins Company, Mount Royal ford Aves., Baltimore 2, 1951.

edition is a distinct improvement over the first edition. provement, according to the authors, was made possible many friendly critical and constructive suggestions sent ers of pharmacology who have used the first edition as Typographical errors have been corrected, and most have been enlarged. For example, the chapter on gen-sthesia now includes Guedel's chart of the stages of ia, which was not in the first edition. Two new chapters otherapy have been added. Drugs are classified accord-rgan systems, and each pharmacological chapter is pre-y a short orientation chapter that reviews the anatomy siology of the organ to be discussed. This practice makes book ideal for nurses and pharmacy students. As a text-r medical students this edition is concise, modern, and It will fill a distinct need in pharmacology.

logical Dynamics of Health Education. Proceedings of Eastern ealth Education Conference, April 13-14, 1950. [Under auspices York Academy of Medicine.] Cloth. $2.50. Pp. 134. Columbia y Press, 2960 Broadway, New York 27; Oxford University Press, ouse, Warwick Sq., London, E.C.4, 1951.

een specialists participated in this searching study of ducation motivation, each from a different approach, and lating review of the subject has resulted. The conclusion lago Galdston, secretary of the committee by which the was developed, that there is no treatment comparable to health education appears justified. Among the sub-cussed are motivation in the adolescent and adult through and older-age groups, mass mediums, union activities, ic implications, nutrition education, and venereal dis-cation, and the contribution of hospital services to health n. The various contributors are careful to keep within its of their assignments, and this makes for clear-cut tion and understanding. The New York Academy of e and its steering committee of the Annual Eastern States Education Conference has performed another creditable in developing this program and presenting it in this ent form.

Vector Electrocardiography: *Clinical Electrocardiographic Inter-* By Robert P. Grant, M.D., and E. Harvey Estes, Jr., M.D. 4.50. Pp. 149, with 41 illustrations. Blakiston Company (division leday & Company, Inc.), 1012 Walnut St., Philadelphia 5, 1951.

e Grant and Estes were on the teaching staff at Emory sity Medical School they taught electrocardiography to students and physicians. In 1949 their notes and dia-used in teaching spatial vector electrocardiography were ed privately by the medical school. The present volume, re, is really a second edition of the book published in much revised and expanded. The authors have tried to a complicated subject in a form that is easily under-Nevertheless, this book is only for those who already good working knowledge of clinical electrocardiography. atial vectors in this work are derived from the standard, ar limb, and unipolar chest leads of the ordinary electro-gram. The methods by which this is done are illustrated ny well-chosen diagrams. The clinical applications of the vector method of electrocardiography are fully discussed as the possible applications to research. This includes the use of this technique in determining the electrical position of the heart, the various effects produced by localized areas of ischemia and infarction, and the ventricular gradient. The spatial vectors of the T wave and of the QRS complex both in the normal state and in disease are discussed in detail.

The authors have not discussed any of the several direct methods of vector electrocardiography and have wisely refrained from discussing some of the more controversial aspects of this subject. The specialist or teacher in cardiovascular diseases should have this excellent monograph in his library as a reference book.

Diagnostik der Kinderkrankheiten mit besonderer Berücksichtigung des Säuglings: *Eine Wegleitung für praktische Ärzte und Studierende.* Von Professor Dr. E. Feer. Sixth edition. Cloth. $9. Pp. 461, with 285 illustrations. Springer-Verlag, Mölkerbastei 5, Wien I, 1951.

This edition has been enlarged and improved, and much new material has been added. The author has attempted to make the work all-inclusive; hence, the book appears in a concise yet an encyclopedic form. It was not written for the skilled specialist or for the student who intends to specialize in pediatrics; it is meant, however, mainly for the general practitioner, who in his daily work feels the necessity of filling those inevitable gaps that must appear in such a rapidly growing and complex subject as pediatrics. With these thoughts in mind the author has arranged the subject matter according to symptomatology and clinical manifestations; in this way a sort of condensed reference book on differential diagnostic problems has resulted. This book has been looked on as a standard among German-speaking physicians for many decades. The new edition brings it up to date by the addition of many diseases that have now become of differential diagnostic interest and importance. Many of the older illustrations have been replaced by newer and better material. The book can be recommended for anyone interested in pediatrics and who has a reading knowledge of German.

The Cure of Rheumatoid Arthritis and Related Conditions (Osteoarthritis, Bursitis, Frozen Shoulder, etc.) by Physical Medicine: A Result of Thirty Years' Study (Original Investigations). By Joseph Echtman, M.D. Cloth. $6. Pp. 251, with 17 illustrations. Herald Square Press, Inc., 233 Spring St., New York 13, 1951.

Although this book purports to be a complete text on the cure of rheumatoid arthritis and related conditions (e. g., osteoarthritis, bursitis, and frozen shoulder), well-established methods of treatment for such conditions are ignored or brushed aside. Echtman begins with the contention expressed in the legend under Figure 1 that only three pieces of apparatus (he illustrates an ancient ultraviolet lamp, an obsolescent long wave diathermy machine, and a very old galvanic sinusoidal apparatus) "are necessary for the treatment of all the conditions discussed in this volume." These conditions include rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, Still's disease, osteoarthritis, bursitis, and traumatic arthritis. The statement that "ionization and interrupted surging sinusoidalization" present "a definite cure for fibrous ankylosis (flexion contractions) of joints" is typical of the many unsound and erroneous conclusions.

Another example of the book's unsound approach to the total problem of the care of the patient with rheumatoid arthritis is the suggestion that "raw (unpasteurized) cream, unheated molasses and raw sugar cane juice" be included in the diet. Again on pages 55 and 56 the author tells of a personal experience in which he accidentally passed "a strong electric current of 200 volts and 50 ma." through his own body from hand to hand. Because the current seemed "to spread upward to the neck and towards the head (brain) but not downwards toward the heart," he concluded that the current travels "via the nervous system and not via the vascular system." This statement overlooks the simple laws of physics with regard to the passage of

RADIOACTIVE IODINE IN ANGINA PECTORIS

To THE EDITOR:—*In the* American Weekly *of June 3, 1951, an article states that patients with angina pectoris have been restored to normal active life through the use of radioactive iodine. Is there any foundation for this report?*

M.D., California.

ANSWER.—The rationale for the treatment of angina pectoris with radioactive iodine (I^{131}) is as follows. I^{131} produces hypothyroidism. The lowered basal metabolic rate in this condition diminishes the oxygen requirements of the tissues, including the myocardium. Thus the diminished blood supply to the heart present in angina pectoris would allegedly be adequate. Blumgart, Freedberg, and associates (*J. Clin. Endocrinol.* **10:**1270, 1950) produced hypothyroidism by this means in several patients with angina pectoris who showed evidence of incapacity, despite marked restriction of activity and despite standard therapy for angina pectoris. The results with I^{131} were worth while in about two-thirds of these patients, many of whom were able to be much more active than previously, with only occasional or no anginal attacks.

Improvement may not be noted for as long as six months, for it may take that long for hypothyroidism to occur. Once it is induced, the patients can be maintained on small doses of desiccated thyroid. The amount required varies, the ideal dose being that amount that will relieve the symptoms of myxedema without raising the oxygen requirements of the tissues to such a level that angina pectoris recurs. Most of the therapeutic failures have resulted from inability to achieve this balance. Many patients experience definite relief from angina when they exhibit myxedema but are markedly distressed by this latter state. Relief from myxedema with desiccated thyroid in these cases is accompanied by a recurrence of anginal attacks. These are serious therapeutic failures, for the original anginal syndrome as well as the induced hypothyroidism is still present.

The induction of hypothyroidism by I^{131} should be undertaken only by experts who have the experience and equipment for proper handling of the procedure. Under these conditions, no radiation sickness or toxic effects occur, except mild transitory thyroiditis in approximately half the cases. Final evaluation of this therapy must await prolonged study.

PHENOBARBITAL WITHDRAWAL SYMPTOMS

To THE EDITOR:—*Please tell me something about withdrawal symptoms occurring after a patient has been taking phenobarbital for some time. How are these treated?*

Garra L. Lester, M.D., Chautauqua, N. Y.

ANSWER.—If the patient has been ingesting as much as 0.8 gm. or more of phenobarbital daily, abrupt withdrawal of medication may be followed by the development of insomnia, weakness, tremor, grand mal convulsions, and delirium. If the patient has been ingesting 0.3 to 0.8 gm. of phenobarbital daily, probably only insomnia, weakness, and tremor will be observed. If the patient is an epileptic, withdrawal of even small amounts of phenobarbital may precipitate status epilepticus. These withdrawal symptoms can be prevented or minimized by slowly withdrawing the phenobarbital. Preferably, treatment should be carried out in an institution. If the patient has been ingesting 0.8 gm. or more daily, one should determine the least amount of phenobarbital that will continuously maintain mild intoxication; usually 0.8 to 1.2 gm. will suffice. After this dose has been determined, the phenobarbital should be reduced at the rate of 0.1 gm. daily. When the dose has been reduced to one-half of the amount that maintained mild intoxication continuously, withdrawal should be stopped for a day or two and then begun again. It is best to administer the phenobarbital in three or four doses daily. If excessive nervousness, insomnia, and weakness appear during withdrawal, reduction of phenobarbital should be stopped for several days, until these symptoms disappear. Electroencephalographic control is desirable, and, if spikes or spike and dome complexes appear during withdrawal, an extra dose of phenobarbital should be given and reduction stopped for a day or so. Usually, withdrawal can be accomplished within 14 days if the patient's intake has been 0.8 gm. or more daily. If the daily intake has been less, withdrawal can be accomplished more rapidly.

SPEECH DEFECT FOLLOWING CEREBRAL ACCID

To THE EDITOR:—*My father, who is 64, has essential hy*
sion (240/180). He had a stroke. I have treated him
the known methods, and, although the blood pressure
160/110, the neurological and cerebral phenomena ha
been overcome. His only annoyance is a type of local
which prevents his pronouncing clearly words contain
letters "p" and "r." He is also diabetic; I have tried to
come this condition without success. I am now using
stigmine bromide but without effect. Is there anything
that could help my father recover full power of speech

Dixon Ramirez, M.D., Cabo Rojo., Puerto R

ANSWER.—It would seem likely that the improvement i
neurological deficit here is all that could be expected. Th
no form of medical treatment available at present that is
to bring about further improvement in a case of cerebral th
bosis with a partial aphasia such as is described here. Natu
with the passage of time and reeducation of the speech ce
further improvement in the speech defect may occur.

CANCER OF BREAST

To THE EDITOR:—*A woman of 44, who is still menstru*
regularly, had carcinoma simplex of the right breast
metastases in a few axillary lymph nodes. Radical mastec
was performed, and the patient received 20 x-ray trea
of the axillary region. What could be done to improv
prognosis? Would surgical or x-ray castration be indi
or would you suggest treatment with testosterone? What
be the dose and duration of treatment if testosterone s
be used? *Paul Immerwahr, M.D., Downers Grove,*

ANSWER.—If the patient shows no signs of persistent or
static disease at this time, further treatment is not indi
Castration by surgical removal or x-ray has not prevent
currence. It is of value in some instances when recurre
disease has taken place. In spite of an occasional opinion
contrary, the same is true of hormonal therapy. It sho
used only when there is definite evidence of local or met
recurrence of disease.

CRACKS AT CORNERS OF MOUTH

To THE EDITOR:—*Can well-fitting dentures cause cracks*
corners of the mouth? My patient has had this irritating
tion for eight years; it started shortly after he was fitt
upper dentures. He tells me that last year he spent $2
vitamins alone and "has been shot with everything bu
pistol." I would appreciate information on this matter.

Laurier E. Hackett, M.D., Camilla,

ANSWER.—Well-fitting dentures will not produce cra
the corners of the mouth. An inadequate diet will. The
tion is not how many vitamins the patient has taken but,
probably, how much food. Darby has reported the cure o
fully controlled cases of superficial glossitis with iron. H
patient's lack of natural teeth prevented his eating me
other important foods? It is suggested that your patient be
iron and a liberal diet, including an abundance of fruits,
tables, and meat. The dentures are not directly at fault.

NOCTURIA

To THE EDITOR:—*In* THE JOURNAL, *Oct. 13, 1951, page*
doctor of 67 years asks why he has to urinate five times
whereas he has normal daytime urination. Besides the
stated in the answer, another cause may be present
case, namely, an increase in blood pressure which n
caused by increased affectivity. A person gets into bed a
feeling sleepy, he begins to think and think, and soon, in
quence, a stimulating emotion develops and is increased
disgust at his inability to sleep, the affectivity or emotion
lates the heart, the heart pumps more blood and rais
blood pressure throughout the body, and the kidneys
more urine. This chain of action is especially comm
neurasthenics. In nocturia of this kind, of course, one
treat the insomnia.

WORKING TOGETHER IN '52

Louis H. Bauer, M.D., Hempstead, N. Y.
President-Elect of the American Medical Association

ust what do we mean by "working together in '52"?
my mind this means not only the medical profession
king together but includes other organizations whose
s are similar to ours. First of all, however, we
st unify the members of the medical profession. We
'e too many members beset with indifference. Our
nty societies have in many areas become organiza-
ns of little influence owing to poor attendance.
ese county societies must be revitalized. Physicians
st be brought to the realization that medical progress
l cease unless doctors learn to work together. Where-
r in the world strong medical organizations do not
st, there will be found the countries with low stand-
s of medical care and medical education. Wherever
medical profession did not stand together as a unit,
se organizations have been taken over by politicians.

ne often hears the complaint that medical societies
reactionary and run by small cliques. If they are,
ose fault is it? Usually it is the fault of the complainers
o have stood aside and contributed only backbiting to
solution of medical problems. If the members of a
iety would take an interest in its welfare, then the
iety would become a forceful agent in the community.
you do not like what your local society does, it is
bably because you have made no fight to change its
icies. A society is the product of its members. The ma-
ity must rule, and the minority must accede to the will
the majority until it can persuade the majority to
nge its policies. Nothing is accomplished by decrying
efforts of those who work, unless those who criticize
willing to work too, and show how things can be
tered.

What holds for a local society also holds for a state or
tional body. Since the A. M. A. has adopted dues as
equisite for membership it has lost members. Why has
s been the case? There are four reasons why a physician does not pay his A. M. A. dues: 1. He is exempt from dues for a variety of reasons. 2. He is socialist in his thinking and, therefore, out of sympathy with the A. M. A.'s campaign against socialized medicine. 3. He is totally uninformed about the A. M. A. and what it stands for. 4. He is not grateful for all that has been done for him.

It is up to those of us who pay our dues to educate the uninformed and convert the ungrateful. The mere facts that a physician is able to practice medicine in high-grade hospitals with the protection of certified therapeutic agents and apparatus, that he has had a high-grade medical education, and that he is practicing in a free state, untrammeled by political regimentation, he owes to the A. M. A.

The American Medical Association must have within it proponents of varying opinions. That is healthy. It is never going to pursue any policy that is not in accord with the opinions of the majority of its members, if it knows what those opinions are. Urge your colleagues to take an active part in society work and to express their opinions. The A. M. A. has to be governed by majority desires. You may not agree with the action or the policy of the federal government, but you do not give up your citizenship because you do not agree. You fight or you ought to fight for a change in those activities or policies.

One trouble today in the United States is the lack of civic responsibility of many of our citizens. It is the same indifference seen in our medical societies carried on into civic life. Our duties as physicians are great, but our duties as citizens are even greater.

This country has been built on a spirit of competition and free enterprise. During recent years there has been a studied attempt to diminish the importance of self-reliance or the desire to improve one's lot and substitute instead a dependence on government. When one loses

---

Read before the Fourth Annual Medical Public Relations Conference, American Medical Association, Los Angeles, December 2, 1951.

the desire to help himself and provide for his family, he has lost much of his independence. There has been an attempt to set class against class and to convince the public that it should rely more and more on government and less and less on personal initiative. Instead of depending on one's own resources for many of the essentials of life, the people are being taught to turn to government. It does not seem to be realized that nothing in this world is free. We either pay for it in fees, wages, or premiums, or we pay for it in taxes. No government has any money except what it takes out of your pocket and mine.

Our forefathers set up a balanced government, evenly divided among the legislative, judicial, and executive branches. The executive branch recently has taken on more and more authority and shoved the other two further into the background. We are ruled today largely by administrative law—law written by bureaucrats who are appointed and not elected. We have become a bureaucracy, in fact.

There are those in our government who are trying to have us follow in the footsteps of certain European countries, countries which are socialist in their thinking and socialist in action, countries so decadent in their economy that they are calling upon a capitalist country to support their socialistic experiments. Corruption has entered into government. Elected officials have been dealing with gangsters and gamblers. Respect for government has diminished.

There is too little training in this day and age in American history and American institutions. Many students reach college and even graduate from it knowing little about the history of this country and its founding, but much about socialism.

Socialism has never worked anywhere, and yet we are steadily becoming less democratic and more socialistic in our government. Is it not time we took stock of ourselves? When this country was founded, the principles on which it was founded were new. No one outside of this country thought they would work, but they did work and this country became the greatest in the world, exemplifying the doctrine of freedom, the doctrine of free enterprise, the doctrine of every man, no matter what his origin, having the opportunity to follow any walk of life and to better himself. A premium was placed on initiative and individual efficiency. Now we have in office in many places those who would revert either to authoritarian government or to the type of government that is paternalistic, where the citizen swaps his freedom for government subsidies, the type of government that becomes the master of men and not their servant. We have a minority government, because, in the last national election, only 47 per cent of those entitled to vote actually voted.

If we are to work together in '52 we must arouse not only the members of our profession to their civic responsibilities, but, through our relations with other organizations and with the public, we must arouse all persons to a sense of this civic responsibility and reawaken the spirit of Americanism, the spirit of competition, and the of free enterprise. We must see to it that regard party label we elect only those officials who believe i American way of life, who believe in a democracy a republic, who are honest, and who will not tolera ruption in public office.

This country is not at the cross-roads; it has al passed the cross-roads and is fast moving down th marked "Socialism." It is up to all true American believe in our institutions and are proud of our hist turn the country back to the cross-roads and once start down the only road that leads to freedom. Th ical profession cannot do this alone, but it can h can lead the way, and it can enlist the support of organizations and individuals imbued with a sp patriotism who do not want to see the United St the way of the Roman Empire, or the way of "th that was Greece"; who want to return to a governm the people, by the people, and for the people, and not want to continue a government by bureaucra aim to enslave the people and make them its serv

This is what "working together in '52" means t is not an easy task. It cannot be left for a few pe do. It requires the back-breaking work not only physician but of every patriotic citizen. This i partisan fight. It is a fight for Americanism—a preserve what is left of our institutions and to re far as possible what has been destroyed of our in liberty. It is your fight—not as a physician but izen. We have stopped socialized medicine for being only, and that campaign will have been in less, now, as citizens we stop the socialization of tire economy and, in fact, of our entire country.

The tide can be turned in *1952*, but we must gether to do it, and we cannot wait even until Ja start. The time to work together is *now*.

Surgical Treatment of Varicose Veins.—As of May there is no cure for varicose veins. There is the poss mechanically improving the circulation to the extremiti judicious use of procedures fitted to the pathologic p the return flow system individually encountered in the ing number of humans so afflicted. There is also the p that by choice of the wrong procedure, or only half-w ment, the condition may be unaltered, yes, even mad The doctor who undertakes the surgical attempt to the varicose patient should be aware that he is tedious, long, patience-tasking and often poorly ap struggle, that is only going to be successful inasmuch been prepared for and inasmuch as it is carried throu completion. There can be no compromise, and a patient for the program to follow the initiation of care is infinitely better readied for the rigorous job ahead. reason it is imperative that the first conference with the who is assuming the task be detailed and specific in the limitations that are inherent in the therapy offe doctor who glibly states that he will cure the veins ignorant of what is possible, or else is worried that th will not be convinced of the efficacy of the treatmen up to this time, is available.—Laurence D. Hilger, M.I cal Treatment of Varicose Veins, *Minnesota Medicine,* ber, 1951.

CLINICAL MANIFESTATIONS OF ARTERIOSCLEROSIS

Howard B. Burchell, M.D., Edgar V. Allen, M.D.
and
Frederick P. Moersch, M.D., Rochester, Minn.

ically the problem of arteriosclerosis is related to occlusion of the small or medium-sized arteries. ain organs or body regions where arteriosclerotic wreaks havoc are the brain, the heart, and the limbs. There is a basic similarity in the nature of or chronic arterial occlusion, but the dissimilarity ptoms is related to the varying minimal oxygen ds of the tissue involved and the duration for oxygen deprivation can be endured without ir- ble harm. One could construct a table showing gree of vulnerability of various types of tissue to f oxygen. On such a list nervous tissue would be top, with renal and myocardial tissues considerably the scale, and skin and voluntary muscle near the n. The results of arterial insufficiency on the integ- f the total person obviously will depend on the tance of, and possibility of functional replacement e tissue jeopardized or destroyed.

addition to the occlusive lesions related to the sclerotic process per se, there are other less fre- but still important arteriosclerotic lesions. These 1) aneurysms, particularly of the abdominal aorta, eal, or femoral arteries; (2) the pressure effects teriosclerotic vessels themselves as illustrated by ic lesions of the cranial nerves in the base of the and (3) arterial embolism from a more central of thrombosis, as from within the heart affected by tion. Isolated calcific aortic stenosis in the aged is considered an arteriosclerotic lesion and is by no an insignificant, causative factor in heart failure dden death.

term "generalized arteriosclerosis," while often is misleading and only superficially acceptable. The e may be widely disseminated throughout the l system, but it retains a certain irregular distribu- oth along the long axis of the artery and about its nference. From the degree of atherosclerosis in art of the body, as for instance the heart, one can- redict the degree of similar lesions in other parts body, as in the brain. The usual benign nature of önckeberg type of arteriosclerosis, which is evi- d by thick nodular peripheral arteries, is well n. We desire also to join in the crusade against the ing of a close relationship between age and arterio- sis, which is either accepted or implied in past al-school curriculums. For purposes of emphasis, make the provocative statement that while aging entless, atherosclerosis is not necessarily a pro- ive nor irreversible process.

BRAIN AND SPINAL CORD

s most difficult to assess the role of cerebral arterial se in the causation of personality disintegrations or lutions seen in elderly persons. Parenthetically, one refrain from labeling a person as arteriosclerotic if he is older and holds a different "fixed" viewpoint from oneself. The possibility of being able to quantitate brain damage from studies of oxygen uptake by new technics is likely but will not be available to us as physicians. The question occasionally arises as to whether a cerebrovascular accident might be evidence of a person's unsound mind in making a will—perhaps better said, in making a new will, maybe not in favor of the relatives. We believe that there would be agreement that a hemiplegic condition is a manifestation of focal damage only and as evidence indicating intellectual deterioration would be most circumstantial and unreliable. The mental changes that are usually attributed to arteriosclerosis include impaired memory, poorly sustained attention, irritability, emotional instability, and poor cooperation.

Apart from the clinical conditions associated with occlusion of the main cerebral arteries, surprisingly few major afflictions or established syndromes result from arteriosclerosis of the central nervous system. One must accept the fact that many symptoms resulting from cerebral arteriosclerosis are not clinically recognizable as such. To the trained neurologist, arteriosclerosis, as compared with neoplasm, is a most disappointing disease in that it only rarely produces the discrete lesions that are of such delight as exercises in pinpoint localization. The usual symptoms of occlusive vascular episodes of the brain are often grouped in the all-inclusive category of strokes. Hemiplegia, hemianopsia, and aphasia are common manifestations. While hemiplegic patients tend to be put in a single group, there is no exact reproducibility of the syndrome, and a careful, even though it may be relatively simple, neurological examination is not only indicated but will be rewarding. Each physician in his lifetime probably sees a patient with thrombosis of the posterior inferior cerebellar artery several times, and if he charts his findings, not at first recognizing the syndrome, recourse to a book on either neuroanatomy or neurology will give him the diagnosis. "Thalamic" pain, pseudobulbar palsy, tremors, extrapyramidal syndromes, and major convulsive disorders are known to follow cerebral vascular insults. It is a strange but well-known fact that at times necropsy will reveal extensive atherosclerosis of cerebral vessels, when a review of the clinical history fails to reveal any neurological disturbance. Similar findings are often made in other parts of the body also, for example, in the heart or extremities. Most neurologists admit an inability to assess senescent morbidity accurately in terms of predicted severity of the cerebral arteriosclerosis.[1]

From the Division of Medicine (Drs. Burchell and Allen) and the Department of Neurology and Psychiatry (Dr. Moersch), Mayo Clinic.

Read in the Symposium on Arteriosclerosis and Hypertension before the Joint Meeting of the Sections on Experimental Medicine and Therapeutics and Internal Medicine at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 15, 1951.

[1] Woltman, H. W.: The Effects of Arteriosclerosis on the Central Nervous System, Chicago M. Soc. Bull. 52: 363-368 (Nov. 12) 1949.

Ophthalmological examinations are of greater reliability in the interpretation of the severity of the hypertensive state than they are as a guide to the degree or predominant location of disseminated atherosclerosis. In particular, examinations of retinas have not been of any consistent value in determining the presence or absence of significant atherosclerosis in other areas. This experience bears out the opinion which Wagener of our clinic expressed years ago. Recent careful histopathological studies by Alpers, Forster, and Herbut[2] have shown that there is no close relationship between retinal atherosclerosis and sclerosis of the small arteries supplying the brain.

The vascular supply of the spinal cord is more than adequate, and major vascular syndromes are infrequent. Rarely thrombosis may occur in the anterior spinal artery and produce a characteristic diplegia with dissociated sensory changes. Occasionally other bizarre or indefinite neurological symptoms, particularly paresthesia, may be attributed to arteriosclerotic changes in the cord. The term "intermittent claudication" of the spinal cord has appeared in the literature, but we doubt that such an entity exists.

HEART

The heart is the organ that has attracted the most extensive studies concerning the nature of the arterial insufficiency resulting from disease of its nutrient arteries. The primary and traditional symptom of such arterial insufficiency is angina pectoris. Severe arterial insufficiency frequently leads to acute myocardial infarctions, the typical clinical picture of which is all too familiar. Electrocardiography has been accused of having been a detriment to progress in research in arteriosclerosis, draining the efforts of investigators into relatively sterile researches, and the technic has been found wanting as an indicator of early coronary disease and often of advanced coronary disease. Despite these justified laments, electrocardiographic studies have done much to focus attention on coronary disease and to allow careful serial clinical studies of patients.

There are still many gaps in our knowledge of the factors determining the relative benignity of coronary disease. Some persons live for many years with no pain or real disability; others have mild or severe, typical or atypical effort pain; others have repeated myocardial infarctions, and still others have cardiac enlargement and failure. The antemortem course cannot be reconstructed from a study of the postmortem specimen. In the uncomplicated case of angina pectoris, it would be a brash physician who would give any exact prognosis. The life
expectancy of a group of patients having angina
can be stated generally by saying that the yearly
rate is about 10%.[3]

Coronary sclerosis increases with age, but
as group studies indicate, the actual amount of
sclerosis is as extensive in a group of men in
decade as in a group of men in the seventh
decades.[4] *Put another way, if one meets on a*
men, one 75 and the other 55, there would be
chance as to which one had the severer atheros
narrowing of the coronary vessels.

Besides the syndromes of angina pectoris and
myocardial infarction, a border state between the
ditions must be recognized. In this border state
the condition of prolonged myocardial ischemia,
eventually may progress either toward recovery or
infarction. It is generally recognized that abo
thirds of acute myocardial infarctions are relate
acute occlusion of the coronary artery, and in
maining third the infarction occurs without any
diately preceding acute occlusion but can be sai
related to an acute coronary insufficiency. My
infarctions related to coronary narrowing but n
actual occlusion are characterized by their sube
dial distribution, absence of a pericardial reactio
of cardiac rupture or development of aneurysm, a
tendency to be more frequent in large hypert
hearts.[5] The incidence of mural thrombosis is si
that of infarcts resulting from acute occlusion. T
gathered and analyzed by Yater and his associ
"coronary deaths" in men less than 40 show th
quarters of these men died without myocardia
tion, and nearly half did not have recent th
occlusion.

In the heart acute arterial occlusion may occ
out producing any infarction; the explanation is
previously stenosed vessel has stimulated the
ment of collateral circulation. It is well recogn
that acute myocardial infarction may occur with
and in this group of patients diabetics with som
of neuropathy have a large representation. In ad
the clear-cut syndromes of coronary sclerosis, th
also may contribute to the heart failure associa
aortic valvular disease or essential hypertension
both.

Syncopal reactions are relatively common in
who have arteriosclerosis. Adjustments to the
the erect position are often less rapid, so that
and giddiness may be complained of. It is to be
bered also that hypersensitive carotid sinus
are often encountered in patients with arterio
changes in their carotid vessels. Syncope also
symptom of calcific aortic stenosis, and it may
dence or a manifestation of intermittent hear
called "Adams-Stokes attacks."

LOWER EXTREMITIES

The peripheral arterial circulation can be
more directly than the circulation of other par
body, for an adequate clinical examination wi
the situation with accuracy. The story of int

dication is usually recognized without difficulty, ugh if the pain be in the buttocks or insteps, the gnosis seems to be missed oftener. To draw a rela- ship to coronary atherosclerosis, the term "angina ris" is not amiss. One can observe evidence of loss of wth of hair and nails, inadequate filling of the capil- es and veins of the feet, or actual gangrene. Early of vitality in tissues of the feet, particularly at pres- points, may readily be overlooked if not searched In clinical practice it is rare that one needs the infor- ion to be gained from plethysmography, oscillometry, riography, measurements of circulation time, or pre- skin temperatures, although these may be important hysiological investigations. The apparent simple ex- nation of the arterial pulsations is an important test dequacy of the peripheral arterial circulation. It can- be done in a desultory manner, and the first step in investigation is for the examining physician himself be comfortable. It must be remembered that an ab- ce may mean no more than interference with trans- sion of the pulse wave. The degree of abnormal pallor en the feet are elevated and the speed with which the ns fill when the feet are moved to the dependent posi- n are better measures of the impoverishment of arterial culation.

While in the heart sudden arterial occlusion is usually cognized as a catastrophic event, analogous events in legs are not as universally recognized. Abrupt im- irment of the arterial circulation owing to arterial rombosis occurs in about 10% of all patients who have ronic occlusive arterial disease resulting from athero- erosis.[7] The symptoms of sudden arterial occlusion ecting the main artery of the leg are variable. Classi- ly, there is pain or numbness and variable degrees paresis, pallor, and coldness. On examination there absence of pulsations, pallid skin, collapsed veins, pesthesia or anesthesia, and lowered temperature of skin. Unless these early signs and symptoms regress thin several hours, necrosis (gangrene) of variable ent or persistent pain indicative of ischemic neuritis ally results.

Ischemic neuritis, observed not uncommonly in pa- nts with chronic occlusive arterial disease in the legs, manifested by constant or paroxysmal pain, commonly scribed as burning or jabbing. It involves areas over ich the skin is intact, usually the dorsum and plantar rface of the foot; it may extend into the leg. There is associated hyperesthesia of the skin.

SOME UNUSUAL AND ISOLATED PHENOMENA

The most frequent problems resulting from arterio- lerosis have been briefly outlined in the preceding para- aphs, but in addition it seems worth while to mention me of the unusual or isolated phenomena resulting om arterial disease. One might imagine oneself on grand unds with a professor who has called back into the hos- tal many of the patients with unique conditions to im- ress a group of visiting dignitaries. As one passes from ed to bed, one might see the following patients: The rst might be a middle-aged man with a well-documented ory of severe hypertension for more than 10 years; he has had a stroke, and now the blood pressure has been normal for 2 years. The cerebrovascular accident has unexpectedly and unpredictably cured his essential hypertension.

The next patient is one who complained of the sudden onset of a continuous noise in his head and presents a proptosis of one eye. A loud continuous bruit is heard over the side of the head, and the diagnosis of an arteriovenous fistula within the cavernous sinus is made. Another patient, elderly and stooped, presents a marked pulsation on the right side of the neck. It has been suspected that she has an aneurysm, but it is demonstrated that the carotid artery is only bent forward, producing the clinical picture of the "kinked carotid." The next patient is elderly and came to the physician because of postural faintness. The physician finds difficulty in determining the blood pressure in the arms, and the pulsations in the arteries of the arms and neck are minimal. There are good femoral pulsations and hypertensive blood pressure readings in the legs. The picture appears as a "reverse coarctation" and is usually due in patients who are old to atherosclerotic narrowing of the origins of the vessels arising from the aortic arch.

In the next bed perhaps there is a patient who has a history of several prolonged periods of chest pain. The electrocardiogram showed evidence of anterior myocardial infarction, and recently there had appeared a systolic thrill and loud murmur, which was maximal in the midsternal area. There has been a rupture through the infarcted ventricular septum, and this patient has been the rare one that has survived for some months. The professor passes a young woman with Cushing's syndrome and advanced atherosclerosis to spend a little time with the patient in the next bed, also a young woman. She has had clinically a myocardial infarction with diagnostic evidence on the electrocardiograms. At present she is troubled by marked effort intolerance related to intermittent claudication and angina pectoris. Age is emphasized as obviously not being a factor; the condition is one of xanthoma tuberosum, as is readily apparent because the small yellowish plaques about the eyes are noted and the nodules in the region of the Achilles tendons and elbows are palpated. The next patient is a man who has classical intermittent claudication, yet there are normal pulsations in the arteries of his lower extremities. When the man walks, the feet become pallid and remain so for a minute or two after his exercise, during which time pulsations have disappeared in the arteries. This is the syndrome of arteriospastic claudication or paradoxical reaction (constriction) of arteries to exercise. It is wondered whether such a reaction could occur in the coronary circulation, but the professor receives no encouragement for such a hypothesis.

To end these special rounds, the professor may have kept his prize patient, and one could not but be affected by his ecstasy as the history is given. A man had normal blood pressure one month, then unexpectedly severe hypertension developed; an excretory urogram revealed no evidence of function of one kidney. The surgeon removed the kidney, and the blood pressure has been normal thereafter. The lesion was an atherosclerotic stricture of the renal artery, with the production of an ischemic kidney and renal hypertension.

---

[7] Allen, E. V.; Barker, N. W., and Hines, E. A., Jr.: Peripheral Vascular Diseases, Philadelphia, W. B. Saunders Company, 1946.

Many other patients would have been worthy of presentation, but these should have been adequate to indicate that the clinical study of arteriosclerotic patients may lead to finding fascinating symptom complexes mixed with the more stereotyped conditions.

In conclusion, the manifestations of arteriosclerosis as they may appear in the patient have been discussed. The importance of occlusive-intimal disease (atheroscle has been emphasized as the most important catego arteriosclerotic disease. When one expands the pro to consider the morbidity and mortality within the po lation at large, the picture is an appalling one. The demiological manifestations of arteriosclerosis are de of persons in their most productive years, the crip of many others, and a heavy sociological problem of ing for many disabled persons, who tend to occupy hospital beds for months or years.

CHOLESTEROL, "GIANT MOLECULES," AND ATHEROSCLEROSIS

Ancel Keys, Ph.D., Minneapolis

The general idea is well established that there is an important relationship between the concentration of cholesterol in the blood plasma and the development of atherosclerosis and coronary heart disease. The study of the epidemiology of the disease is as yet only in its crudest beginnings, but two points are agreed. Whenever there is a persistently high level of cholesterol in the blood, there is a tendency toward early and severe atherosclerosis. And whenever there is severe atherosclerosis, there is a high incidence of coronary heart disease.

The list of diseases in which occurrence of coronary heart disease is unduly frequent is familiar: diabetes, nephrosis, hypothyroidism, xanthomatosis. These have the common property of being associated with hypercholesteremia. Moreover, in animal experiments whenever it is possible to produce sustained, marked hypercholesteremia, there is eventually development of atherosclerosis. Finally, there is the crucial fact that patients with definite coronary disease tend to have distinctly elevated levels of cholesterol in the blood serum.[1]

In spite of these facts, there is insufficient information about the utility of the serum cholesterol measurement as an indicator of atherosclerosis or as a predictor of impending danger from coronary heart disease. There are several reasons for this: 1. Normal standards for serum cholesterol have been inadequate until recently. 2. I ing man coronary heart disease can be recognized not atherosclerosis alone. 3. Patients with coronary ease show a wide range of concentrations of choles in the serum, and this overlaps the wide range of v found in persons who are clinically healthy.

SEARCH FOR OTHER CRITERIA

It is understandable, then, that there is a vig search for other characteristics by which healthy pe and those who have or in whom coronary heart di may develop can be discriminated. It is particularl sired to have a measure of the tendency to coronar ease before appearance of the clinically recogn condition. This is essential for the development, t and application of preventive measures; its ab a major reason for the fact that as yet no real prev hygiene can be offered.

The search for discriminating characteristics ha centrated on the blood for good reasons: 1. With ra ceptions, coronary heart disease requires the prese atherosclerosis for its development. 2. A basic char istic of atherosclerosis is the deposit of cholester fatty materials in the arterial walls. 3. The deposi stances do not seem to be manufactured locally arteries, so they must come from the blood. 4. Bl accessible for sampling and analysis.

Besides total cholesterol, attention has been devo cholesterol esters, fatty acids, phospholipids, and v ratios and combinations of these variables. So far n these variables has been shown to be superior serum total cholesterol concentration as a predic coronary heart disease. Most recently there has great interest in the lipoproteins and in certain density materials which may be separated in the centrifuge. It is important to examine the eviden the current excitement about these.

G SUBSTANCES OR "GIANT MOLECULES"

For some time it has been evident that most cholesterol does not exist in simple solution in the plasma but is associated in complexes with protei lipoids. Gofman and his colleagues in Berkeley ha veloped methods for estimating the amounts of suc density complexes by observing their flotation ultracentrifuge.[2]

is the theory of the Berkeley group that certain of : complexes are somehow productive of, or at least associated with, the development of atherosclerosis. real villains in the piece, it is suggested, are the "giant ecules" which are characterized in the ultracentrifuge –10 to —20 Svedberg units of sedimentation. It is venient to call these the "G substances."

'hat is the evidence that the G substances are respon- for atherosclerosis and coronary heart disease? litatively, it is exactly the same kind of evidence :h supports the contention that the total cholesterol surement is significant. The conditions in which occence of coronary heart disease is unduly frequent, , diabetes, nephrosis, hypothyroidism, and xanthoosis, are found to be associated with a tendency to levels of G in the serum. When atherosclerosis is luced in animals by feeding massive doses of cho-rol, the level of G is much increased. And when the m G is measured in patients with coronary heart dis-, there is found a distinct tendency toward higher ls than are found in clinically healthy people.

ut how does the G measurement compare, in these ects, with the simple measurement of total choles-l? A full answer would require long-range and large-researches, but highly significant indications can be ined now. In animal experiments what is the correla- between the degree of atherosclerosis and the serum l of G, on the one hand, and of cholesterol, on the er? How sharply is it possible to discriminate between onary patients and clinically "normal" persons with G criterion as compared with the cholesterol cri-on? What is the correlation between the G and the lesterol concentrations in the serum? The California kers have not provided analyses of these points, but r own and other raw data in the recent literature can ıssembled and analyzed.

CORRELATIONS BETWEEN G AND CHOLESTEROL

'irst, the simple correlation between G and cholesterol ısurements may be considered. Gofman and others [2c] eatedly suggest that there is little or no significant cor-tion and state, "For any particular patient the analy-l serum cholesterol is of no value in predicting the centration of S_f 10-20 molecules (G)." But they pro- scatter diagrams of the data on 89 clinically "nor-" persons and 98 patients with myocardial infarctions. these 187 men the crude correlation coefficient be-en G and total cholesterol is r (coefficient correlation) +0.56, with the 95% limits of probability being).45 and +0.66.

This estimate of correlation is minimal; it is less than true correlation because of the fallibility of the meth-. The analytical uncertainty for a single measurement cholesterol is of the order of 5% or more, and uncer-ıty in the G measurement is very large indeed. The rkeley group originally stated that the limit of resolu-n for G was 5 mg. per 100 ml., but personal com-ınications indicate a considerably greater uncertainty. om the data in my own and other laboratories, it ap-ars that the uncertainty of a single measurement is of order of ±10 mg. of G per 100 ml. Since 42% of 187 values at hand for correlation analysis are less ın 15 mg. per 100 ml., the effect of such random uncertainty is very large. Without acceptable reliability data, it is impossible to estimate precisely the true correlation which would be found if infallible analytical methods were available. It is clear, however, that the true relationship between G and cholesterol measurements must be considerably closer than indicated by the crude value of r = +0.56 and may approach the value of r = +0.7.

ANIMAL EXPERIMENTS

The published direct evidence that G may be a useful predictor of the degree of atherosclerosis is from an experiment on rabbits fed cholesterol with subsequent blood analysis and ultimate grading of the atherosclerosis (0 to +4) by the pathologist.[2c] From the published raw data we can calculate the correlation between the concentration of G in the serum and the degree of atherosclerosis found. The coefficient is r = +0.77. At the same time these data appeared (August, 1950) a very similar study was reported from Toronto in which the degree of atherosclerosis was similarly graded in cholesterol-fed rabbits and the serum cholesterol measured.[3] From these raw data I have calculated the coefficient of correlation to be r = +0.85.

Both of these correlations are highly significant. They show that in cholesterol-feeding experiments on rabbits both G and cholesterol measurements have value in predicting the resulting degree of atherosclerosis. With G the forecasting efficiency is indicated to be 37%, i. e., by measuring G the predicting error is reduced by 37% from that which would obtain without that information. With the cholesterol measurement the forecasting efficiency is 50%. Neither measurement is a very precise predictor, and certainly G is not better than cholesterol.

NORMAL PERSONS COMPARED WITH CORONARY PATIENTS IN REGARD TO G

The main argument for the importance of the G concentration in the serum has been the comparison of the values found in clinically healthy persons with those found in patients who have had myocardial infarctions, and hence are presumed to represent advanced degrees of atherosclerosis. The data provided [4] clearly indicate a substantial tendency for the "patients" to have elevated levels of G.

In the published articles there are no critical analyses of the material. It is not enough, for example, to show that there is a difference between the average values of G in the "patients" as compared with the "normal" persons. Since the data are greatly skewed in distribution, ordinary averages have little meaning anyway. But average differences are not the issue. What is wanted are answers to the following questions: 1. Precisely how well does the G measurement differentiate between patients and "normal" persons? 2. How does G compare with the cholesterol measurement in this regard?

THE G MEASUREMENT AS A DISCRIMINATOR

Fortunately, it is possible to reconstruct the essential raw data from the published diagrams and to proceed with an analysis from these. Even so, the analysis presents difficulties because of major changes in calibrations from one paper to the next and because of internal inconsistencies in the data. For example, Figure 4A [2d] shows the mean values in "normal" men arranged by ages, Figure 4C compares "normal" men aged 41 to 70 with men of similar age who have had infarcts. But the two sets of "normal" men do not correspond; if Figure 4A is accepted as the standard, it would appear that the average age of the normal men aged 41 to 70 was about 40. Alternatively, it would be necessary to insist that the discrimination between patients with infarcts and normal persons is considerably less than indicated in Figure 4C. To avoid such problems I have relied solely on the scatter diagrams [2c] which show the individual data.

Patients (%)	20	30	40	50	60	70	80	90
"Normal" persons (%)	6	10	14	20	26	32	42	54
D ratio	3.3	3.0	2.9	2.5	2.3	2.2	1.9	1.7

* Men 31 to 50 years.
† Calculated from raw data in Gofman and others (Figs. 4 and 5).[2c]

The material on G measurements has been analyzed in several ways for each of various age ranges. Since the results are all consistent, it is enough to consider in detail only one form of the analysis of the findings on men aged 1 to 50. A suitable beginning is to arrange the data for atients and for normal persons in arrays from lowest to highest values of G. It is then easy to find the proportions of patients and normal persons in whom any given value of G is exceeded. The results for the men aged 31 to 50 are summarized in Table 1.

Table 1 also gives the ratio between the proportions of patients and normal persons in whom particular values of G are exceeded. A value of G which is exceeded in 50% of the patients is also exceeded in 20% of the normal persons, and the discrimination at this G level is indicated by the discrimination ratio D = 50/20 = 2.5. The best discrimination is achieved with a level of G so high that it is exceeded in only 20% of the patients; at this level 6% of normal persons are included, and the value of D is 3.3.

It is obvious that the overlap is very great, but it might be suggested that these discrimination ratios indicate some validity for predicting coronary disease and that, for example, a blood value which is exceeded by 50% of the patients could be judged to indicate coronary disease with a probability of 2.5 to 1. Actually, this would be the case only if the population were made up of equal numbers of normal persons and persons with coronary disease. But in a random sample of adults in the United States it would be closer to reality to predict that perhaps 5 or 10% have or are threatened with coronary disease. Suppose then that a population is made up in the ratio of 9 to 1 of "normal" persons and persons with coronary disease and that a critical level for G is selected which *is exceeded in 50%* of the patients with coronary disease. And now suppose that G measurements are made on this mixed population of normal persons and persons with coronary disease. If there are 1,000 persons in all, i. e., 100 with coronary disease and 900 who are norm will be found that 230 persons (0.2 × 900 + 0.5 × =230) will have values exceeding our critical lev these only 50 are actually coronary patients. The r is we have "found" only half of the persons with cor disease and have erroneously diagnosed coronary dis in 180 normal persons.

This is disconcerting. Perhaps one should raise critical value of G to the point at which it is excee in only 20% of coronary patients and at which discrimination ratio is at a maximum. With this hy thetical population of 1,000 persons, it would the found that 74 persons (0.06 × 900 + 0.2 × 100 = would show G values above the critical level. Only of the coronary patients would have been discove while 54 normal persons would have been erroneo diagnosed.

Now it may be objected that this analysis does allow for the fact that in some of the persons who w be judged to be normal, clinically, serious atheros sis may be developing, and they are really threatened coronary heart disease in the near future. Suppose *10% of the Berkeley* "normal" persons are of this nd that they have a distribution of serum G values id cal with the coronary patients. The values in Tal should then be changed to those given in Table 2. the calculation can be repeated for a hypothetical po tion of 900 "true normal" persons and 100 persons are potential patients with coronary disease. With a cal level of G which is exceeded in 50% of the normal persons, a total of 200 persons (0.167 × 9 0.5 × 100 = 200) receive the label "coronary pati Of these 150 are true normal persons while 50 actual coronary patients are missed.

This analysis could be elaborated further. For exa all the figures cited here are attended by errors whi be estimated from elementary probability theory. ance for the standard errors of the various propo would still further increase the uncertainty of the p tions which can be made from the G measuremen

TABLE 2.—*Percentages of Coronary Patients and Normal" Persons * in Whom Given Values of G Conc tration in Serum Are Exceeded* †

Coronary patients	30	40	50	60
Total normal persons	10	14	20	26

True normal persons	7.8	11.1	16.7	22.2
D ratio ‡	3.8	3.6	3.0	2.7

* Those not in the predisease state. It is assumed that 10% "total normal" persons are actually in the predisease state and th "false normal" persons have the same serum G picture as the c patients.
† Calculated from data on men 31 to 50 years in Gofman an (Figs. 4 and 5).[2c]
‡ Equals value in first line divided by value in fourth line.

The situation is no more favorable for women older men than for the 31 to 50 year age grou sidered so far. Table 3 summarizes data comparin 31 to 50 and 51 to 60. The discrimination is poore the older men, as is evident from the D ratio val Table 3.

Poor as the predictive value of the G measurem it is conceivable that it might be better than the me ment of cholesterol. But it is not necessary to spe there are excellent data for a detailed comparison.

ıAL PERSONS COMPARED WITH CORONARY PATIENTS IN REGARD TO CHOLESTEROL

ıe Boston study of Gertler, Garn, and Lerman [1e, f] red 97 men who had had myocardial infarctions and men of the same age who were clinically "healthy." l respects these men seem entirely comparable to the 50 year old men studied at Berkeley, but the Boston ers studied cholesterol (and other items) instead e G concentration in the serum. From the published [1f] it is possible to construct the counterparts of es 1 and 2 for cholesterol values. To save space only e 4, the counterpart of Table 2, need be considered. ıble 4 indicates that a critical level of cholesterol h is exceeded in 30% of the men known to have nary disease will include only 3% of men labeled ically healthy." Moreover, if the same assumption ıde about "false normal" persons as was made in the ysis of the G data, it appears that this cholesterol would include no normal persons. A lower choles- level, which would be exceeded in 40% of the cor- y patients, would result, with the hypothetical ılation mentioned earlier, in finding 41 persons ı11 × 900 + 0.4 × 100 = 41), all but one of whom ld be properly labeled "coronary patient." How- , this level would fail to include 60 persons with al coronary disease. At the next lower level of serum esterol which would be exceeded in 50% of the ınary patients, from this same population there would ecorded 130 persons with coronary disease; 80 of e would be erroneously diagnosed.

ınilligrams per 100 ml. of serum. Note that these values are about . less than are reported from the most recent calibrations.

VALIDITY OF THE ANALYSIS

: would, of course, be desirable to have for these ıparisons both G and cholesterol measurements on same men. The Berkeley group have, in fact, pub- ːd [2c] (Fig. 14 and 15) data which would appear to ıuitable for such a comparison of G and cholesterol ısurements as discriminators between "normal" per- s and coronary patients. In personal communications ı Dr. Gofman it was learned that these "normal" per- s and coronary patients for whom both G and choles- ıl were recorded were of different ages, the "normal" sons being younger, on the whole, than the coronary ients. Because of this, Dr. Gofman objected to the a of making a comparative analysis with these data. wever, this age difference would not seem to bar nparisons of the two discriminators unless normal : trends for cholesterol and for G are substantially different. Actually, the age trends for these two variables are very similar,[5] at least to an age of about 60. Calculations of data on the age trends for healthy men for cholesterol [5a] and for G [2d] show that, with the value at age 25 taken as 100% in the case of each variable, the median "normal" values for cholesterol and G, respectively, are 109 and 109 at age 35, 128 and 128 at age 45, 139 and 143 at age 55. These close agreements indicate that the data in Gofman's [2c] (Fig. 14 and 15) may be properly used to compare the two criteria as discriminators between healthy men and men with infarctions.

TABLE 4.—*Percentages of Coronary Patients, "Total Normal" Persons, "True Normal" Persons, and "False Normal" Persons in Whom Given Values of Total Cholesterol Concentration in Serum Are Exceeded**

Coronary patients	30	40	50	60	70

True normal persons §	0	1.1	8.9	18.9	28.9
D ratio ‖	Infinite	36.3	5.6	3.2	2.4

* Calculated from data on men 30 to 50 years in Gertler, Garn, and Lerman.[1f]
† Equals value in first line divided by value in second line.
‡ Those who are clinically healthy but actually in the predisease state. It is assumed that 10% of the "total normal" persons are actually in the predisease state and that these "false normal" persons have the same serum cholesterol picture as the coronary patients.
§ Those not in the predisease state.
‖ Equals value in first line divided by value in fifth line.

The principal results are summarized in Table 5. They show that this material conforms very well with the results summarized in Tables 1 through 4. Both G and cholesterol values show slightly poorer discriminations than obtained in the previous analysis. But the relationship between the discriminations obtained with the two criteria, which is the point at issue, is very similar to the result obtained in the comparison of the Berkeley and the Boston findings for men 30 to 50 years. In these Berkeley versus Berkeley comparisons the crude D ratios with G as the criterion averaged 65% of the crude D ratios with cholesterol as the criterion, i. e., the average discrimination with G was roughly two-thirds as good as with cholesterol. In the Berkeley versus Boston comparisons (see Tables 1 and 4) over the same range, the crude D ratios with G averaged 66% of the D ratios with cholesterol.

TABLE 5.—*Percentages of Eighty-Nine Clinically Healthy Men and Ninety-Eight Men with Coronary Disease in Whom Given Values of Serum Concentration of G and Total Cholesterol Are Exceeded* *

	% of Men Included				
G in coronary patients	30	40	50	60	70
G in normal men	12	19	25	35	42
G ratio	2.5	2.1	2.0	1.7	1.7
Cholesterol in coronary patients	30	40	50	60	70
Cholesterol in normal men	7	13	17	19	26
Cholesterol ratio	4.3	3.1	2.9	3.1	2.7

* Calculated from raw data given by Gofman and others (Figs. 14 and 15).[2c] The "normal" persons had a younger average age than the coronary patients.

---

5. (*a*) Keys, A.; Mickelsen, O.; Miller, E. v.O.; Hayes, E. R., and Todd, R. L.: The Concentration of Cholesterol in the Blood Serum of Normal Man and Its Relation to Age, J. Clin. Invest. **29**: 1347, 1950. (*b*) Gofman.[2d]

These results, then, are in agreement with our first analysis, and they also suggest that the data in Figures 14 and 15 of Gofman and others [2c] may be applied in further exploratory analyses.

COMBINED G AND CHOLESTEROL IN PREDICTION

Since cholesterol and G concentrations in the serum are by no means perfectly correlated and since each measurement has, by itself, some value in discriminating between normal persons and persons with coronary disease, it is reasonable to suggest that a combination of the two criteria could be superior to either taken alone. The only data now available to test this idea are those discussed in the preceding section of this paper. Though these have the disability of the questionable age factor, the foregoing analysis suggests that they may be suitable for exploring the question of combined criteria.

Accordingly, systematic trials were made of combinations of G and cholesterol critical levels in the general range which would include 30 to 70% of the coronary patients. For example, it was found that when a critical level was set at 20 mg. of G and 220 mg. of total cholesterol (per 100 ml. of serum), this combined criterion was exceeded by 57.1% of the coronary patients and by 23.7% of the normal persons, giving a D ratio of 2.37.

In all, 14 different combinations were tested. All of these produced better *discrimination, i. e.,* higher D ratios, than were obtained with critical levels of G alone hich included comparable percentages of the patients. On the other hand, none of these combinations surpassed, or even equaled, the discrimination obtained with total cholesterol alone.

These results would indicate that the G measurement makes no significant independent contribution to the iscrimination between "normal" persons and persons with coronary disease. If the data were completely reliable, in fact, it might be concluded that the only reason G measurements have any discriminating power is because they are (imperfectly) correlated with total cholesterol. But the intention is not to insist on pushing the analysis to this limit. These trials merely indicate, again, that there is no basis as yet for ascribing any more virtue to the G measurement than to the cholesterol measurement.

COMMENT

In addition to the analyses summarized previously, the published data from the Berkeley group [2c, d] and of the Boston group [1f] have been treated and compared in several other ways, including analysis of successive deciles of blood concentration and calculation of biserial correlation coefficients.[6] Furthermore, in estimating the probable success of application of these blood analyses to individual and group diagnoses, several different assumptions were tried in regard to the frequency of recognizable and impending coronary disease.

All the findings from these various analyses were in essential agreement with the analysis previously presented. For example, the biserial coefficient of correlation was computed for the presence of coronary dis versus serum cholesterol level (in the Boston data) a versus serum G level (in the data on men 31 to 50 Gofman [2c]). For cholesterol the biserial r = 0.61, S.E (standard error coefficient correlation) = ±0.08; for G the corresponding values are r = 0.41, S. E.$_r$ = ±0.1

By making various assumptions it is possible to f bases to suggest that the predictive value of G a cholesterol measurements may be higher than indica *in the preceding sections of this paper.* For exampl may be assumed that half of the "normal" persons co sidered here are actually atherosclerotic and are serio threatened with coronary heart disease and that th "false normal" persons have blood concentrations of G and cholesterol which conform to the coronary patien category. In this case the discrimination achieved by t blood analyses would be much better, i. e., it would b possible to find critical levels of G and total cholester which would separate true "normal" persons from actu and potential coronary patients with considerably le uncertainty. But this would not change the relations between G and total cholesterol as discriminators; it s would appear that G is no better, and actually may b considerably worse, than cholesterol for these purpos

Caution should be exercised in discussing—and es *mating—the prediction* of coronary heart disease on th basis of the presence of atherosclerosis. It is true that t great majority of adults, at least over 30, have appreciable degrees of coronary atherosclerosis. Beyond th age of 40 it may be that 50% of American men hav marked degrees. This is not, however, evidence that or most of these men will shortly die or be disabled wi coronary heart disease.[7] The questions which prope should be asked *are these:* What percentage of these m are seriously threatened with disaster in the next ye What percentage in the next five years? How well m we predict which men? Only longitudinal studies c answer the last question with precision.

In this paper no attention has been paid to other ite in the blood analysis that have been proposed as havi value in detecting or predicting serious atherosclerosi For the most part, data adequate for a reasonable anal sis are not available. From such data as have been pu *lished it does not seem probable that* any of them—ra of cholesterol to phospholipids, cholesterol esters, lipoproteins, and so forth—will prove markedly superi to total cholesterol for these purposes. But it is rash judge on the basis of the present scanty evidence.

SUMMARY

There is substantial correlation between *the* concent tions in human blood serum of total cholesterol and "giant molecules" characterized in the ultracentrifu by —10 to —20 Svedberg Units of sedimentation substances). The coefficient of correlation is at least the order of 0.6 and may be as high as 0.7. In cholester fed rabbits the resulting degree of atherosclerosis is correlated with both the concentrations of G and chol terol in the serum, *the coefficient* of correlation being the order of 0.8. There is no evidence that the conce tration of G is more critical than that of total cholester

ORGANIC NEUROLOGICAL SYNDROMES DIAGNOSED AS FUNCTIONAL DISORDERS

Morris J. Tissenbaum, M.D., Harry M. Harter, M.D., Brooklyn
and
Arnold P. Friedman, M.D., New York

is generally recognized that functional components be present wherever there is organic disease, neuro- al or otherwise. Such functional material can at s dominate the picture to such a degree that it is ible for the physician to overlook otherwise signifi- signs of physical disease. This paper is not intended criticism of diagnostic failure. It is rather a plea for oser working relationship between psychiatry and ology. We hope to highlight the need for viewing patient as a whole, interrelating physical and psychi- problems. Limited investigation is inadequate insur- e when dealing with patients. The importance of tiple examinations as well as reasonable competence eurology must be stressed.

)ver a period of several years our experience has been ote that a fair number of alleged psychiatric cases ultimately diagnosed as neurological. We feel that e have been enough such instances to warrant a rological unit within a psychiatric service. Thus, it has our good fortune, as a result of initial neurological eys of all patients and follow-up examinations, to over definite neurological disorders, at times quite xpectedly. All the cases in this series identified as rological were diagnosed by physicians of our neuro- cal unit in the course of such routine studies and ow-up examinations.

Ve must point out that we are dealing with veterans rently under treatment in a Veterans Administration ic. The recorded diagnoses are based on initial find- at the time of development of symptoms in military vice as well as signs and symptoms demonstrated by ther examinations after leaving military service. We l that the results of our survey are just as applicable private and civilian types of practice. In fact, most of se patients have had much contact with private gen- l practitioners as well as private psychiatrists.

As a result of our experience, it is now standard pro- lure for all patients, regardless of diagnosis, to have horough neurological examination shortly after arriv- at the Mental Hygiene Clinic. If the patient is under atment for any extended period of time, he receives a peat" neurological as well as a general physical amination annually, unless during the course of treat- nt he has shown some suspicious signs which warrant earlier neurological or other medical review.

REVIEW OF CASES

A total of 395 neurological cases were reviewed. Three hundred forty-two cases were correctly diagnosed early in the course of the syndromes. However, there were 53 cases (or 13.4%) incorrectly diagnosed for varying lengths of time prior to an eventual change to a definitive neurological diagnosis. Figures are given on the length of time these cases were handled as psychiatric before a change of diagnosis was established by neurological examinations (Table 1). The largest number of cases were considered functional for a period of two to six years before a change of diagnosis was made. We have a mean of 4⅕ years, with the greatest number of cases (17) handled as functional for four years. In these cases all the patients were given psychotherapy at one time or another for varying lengths of time, and most of them had had contact with more than one psychiatrist. The psychiatrists concerned were Veterans Administration clinic psychiatrists, contract clinic psychiatrists, as well as private panel psychiatrists.

TABLE 1.—*Duration of Time Carried as Psychiatric Prior to Change to Neurological Diagnosis*

Read before the Section on Nervous and Mental Diseases at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 14, 1951.

Reviewed in the Veterans Administration and published with the approval of the Chief Medical Director. The statements and conclusions published by the authors are the result of their own study and do not necessarily reflect the opinions or policy of the Veterans Administration.

Chief (Dr. Tissenbaum) and Assistant Chief (Dr. Harter) Mental Hygiene Unit, Brooklyn Regional Office, Veterans Administration; Area Consultant in Neurology, Veterans Administration, New York, and Assistant Professor of Clinical Neurology, College of Physicians and Surgeons, Columbia University (Dr. Friedman).

facility. It may also be true that in some instances, with our limited armamentarium for treating certain neurological disorders, the delay in diagnosis perhaps did not make too much difference therapeutically. Nevertheless, we are also dealing with such conditions as Parkinson's syndrome, expanding lesions of the brain, epilepsy, Ménière's syndrome, herniated disc, and so forth, which can be treated and the needless distress alleviated by proper care. It is not inconceivable that a patient's life, in some instances, could be considerably prolonged if his disorder, as in the case of a brain tumor, were correctly diagnosed at an early stage.

Table 2.—*Nature of Psychiatric Diagnosis Prior to Change to Neurological Diagnosis*

Conversion reaction or hysteria	17
Mixed or unclassified neurosis	11
Neurasthenia or hypochondriasis	10
Anxiety reaction	10
Somatization of one type or another	8
Psychopathic personality	5
Dementia praecox	2
Anxiety hysteria	1
Obsessive-compulsive neurosis	1

Some of the psychiatric diagnoses used for these patients prior to change of diagnosis are listed (Table 2). In some instances a single patient was diagnosed differently by different psychiatrists. Thus, it was not unusual to find that a patient over a period of four years might have two or more diagnostic classifications. The frequency of the diagnosis of conversion or hysteria is worth noting.

The patients have been divided for convenience into three groups, A, B, and C (Tables 3, 4, and 5). Group A consists of those patients who are seen most frequently in the clinic and group B of those who are observed less frequently. Group C consists of those patients correctly diagnosed initially. In Table 3 it is worth noting that the highest percentages of incorrect diagnosis appear in the categories of Parkinson's syndrome, multiple sclerosis, and expanding lesions of the brain. We feel that, particularly with the first two, functional signs of one type or another are extremely frequent as precursors of organic disease and may very well be part and parcel of the total disease process as well as a personality reaction to the disease. The sampling of cases of individual disease entities in Table 4 is limited in number but points to a potentially high proportion of functional diagnosis prior to establishment of correct neurological diagnosis. In most of the disorders listed in Table 5, there is an acute onset and obvious clinical signs early in the course, so that diagnosis tends to be made with greater facility.

Table 3.—*Commonest Neurological Syndromes (Group A)*

	No. Cases	No. Correct Diagnosis	No. Labeled Psychiatric Prior to Change of Diagnosis	% Incorrect Diagnosis
Parkinson's syndrome	30	18	12	40.0
Multiple sclerosis	30	20	10	33.3
Expanding lesions of brain	13	9	4	30.7
Herniated disc	29	24	5	17.2
Neuritis and neuralgia (21 of traumatic origin)	46	43	3	6.5
Idiopathic epilepsy	157	148	9	5.7

The other conditions, such as endocrine distur
neurofibromatosis, and so forth, tend to be easily
nosed in most instances.

COMMENT

Parkinson's syndrome, multiple sclerosis, expa
lesions of the brain, and herniated disc, of the com
neurological syndromes seen in this clinic, show
highest percentage of cases considered to be func
prior to clarification of the diagnosis. Other cond
seen less frequently, about which functional diag
were made, include such varied diseases as syringom
spinal cord tumor, primary lateral sclerosis, amyot
lateral sclerosis, Raynaud's disease, myotonia at
and so forth. Of 157 cases of epilepsy, 148 we
rectly diagnosed. Only nine (or less than 6%
incorrectly diagnosed and handled as psycho
until epilepsy was eventually verified by means of
mal electroencephalograms and the witnessing
fide seizures. It is true that in cases of so-called id
epilepsy a neurological examination is generally
ductive of abnormal findings.

In some instances organic disease was suspe
some time, though the case continued to be
"neurosis." Clarification of organic disease was n
lished until the disease had progressed much fa
is possible in many such cases that early in the
enough concomitant psychiatric symptoms may
ent to mask the organic picture, frequently ca
psychiatric diagnosis.

It is our impression that so-called functional symptoms a neurotic nature occur more readily as precursors of ganic disease in certain conditions such as Parkinson's ndrome or multiple sclerosis. We believe that neurotic aits in such patients, having existed prior to onset of urological disease, are accentuated in the early stages the neurological disorder, and possibly aggravated later the disease progresses. A neurologically disabled pa-nt is faced with conditions requiring adjustment which ay be beyond his capacity. Emotional or even mental mptoms may result from activation of unconscious nflicts, which until then had been under control. This ay account for what is often described as psychogenic erlay in many physically ill patients, neurological or herwise. Braceland and Giffin[1] in their paper on mul-ple sclerosis and Brenner, Friedman, and Merritt[2] in eir work on basal ganglia syndromes were impressed ith the variability of psychiatric symptoms and person-lity organizations among their cases. With this we are complete accord.

It is probably true that many cases, had they been udied by trained neurologists, might have been correctly iagnosed earlier in the course of the disease process, ough it is worth commenting that neurologists, too, are ot infallible. To simply say that a patient has had a eurological check-up somewhere along the line is not ifficient proof that there has been real neurological learance. Unfortunately, most psychiatrists, as well as ost other specialists, are not adequately trained in eurological examination and interpretation of neurological signs. We believe that the nearly 14% of cases considered to be functional for periods averaging more than four years prior to establishment of a neurological diagnosis warrants the establishment of a neurological unit in a psychiatric clinic.

CONCLUSIONS

All patients, before acceptance for psychotherapy, should have a thorough neurological survey in order to rule out or establish organic disease. When neurological disease is suspected, though psychotherapy may be in progress, patients should be reexamined at regular intervals. Adequate training in clinical neurology for psychiatrists should not be an academic issue. It has practical value for both psychiatrist and patient. Needless waste of time, effort, and money can be reduced to a minimum by the approach described in this paper. Psychotherapy, when indicated for neurological cases, can be more definitive, since more precise knowledge as to which part of the picture is organic and which is psychogenic would be available. The establishment of a neurological unit in a psychiatric service is justified.

EVALUATION OF PSYCHOGENIC SYMPTOMS IN GENERAL MEDICINE

USE OF MINNESOTA MULTIPHASIC PERSONALITY INVENTORY

Asher A. White, M.D., Minneapolis

The role of the psyche in the production of somatic ymptoms is under vigorous discussion in modern medi-al literature. In its evaluation the physician has relied eavily on his instinct of understanding, which is a ebulous and variable faculty. If this subjective method ould be replaced by objective evaluation, diagnosis in his field might be simpler and patients needing psychi-tric evaluation might be recognized more accurately. n view of the need for objective evaluation of the emo-ional factors in the illnesses of patients presenting them-elves to the diagnostician, I began using the Minnesota Multiphasic Personality Inventory, a psychometric test, s an experimental procedure in private medical practice. This test is a new tool, designed to record neurotic atti-udes, which may help to sort out more accurately the patients with nervous symptoms who require psychiatric aid from those who can be managed by the general physician. The object of the present study is to analyze the practical results of use of the test with 70 patients.

DESCRIPTION OF TEST

Hathaway and McKinley[1] published the details of their Minnesota Multiphasic Personality Inventory in sections from 1940 through 1948. They reported in 1943 on the use of this test among psychoneurotic patients in general medical practice.[2] The device as recommended for clinical work consists of a box containing 550 cards with one psychologically significant statement printed on each card. The patient sorts these statements into three groups designated True, False, or Cannot Say, as he considers them applied to himself (Fig. 1). After the

cards have been sorted by the patient, the responses are recorded and scored by a clerk (Fig. 2). The test scores relate to nine categories: hypochondriasis, depression, hysteria, psychopathic personality, masculinity-femininity, paranoia, psychasthenia, schizophrenia, and hypomania. The significance of responses to the statements on

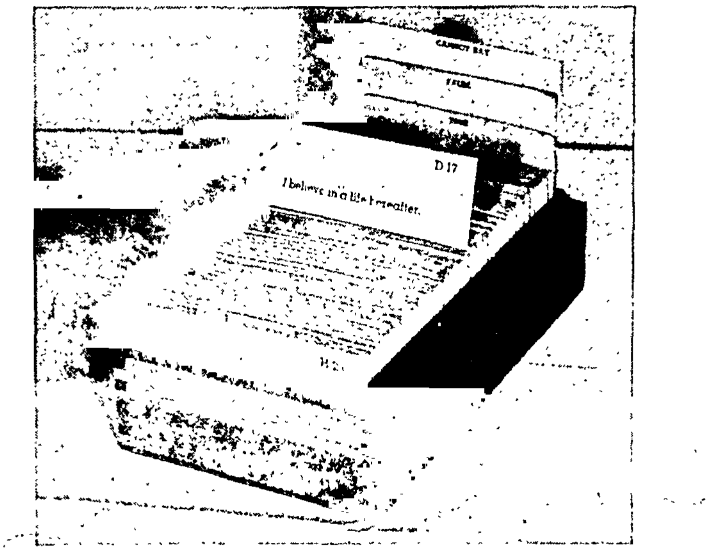

Fig. 1.—Box containing cards with psychologically significant statements to be sorted by patient.

the cards was developed by extensive comparison of the responses of presumably normal persons with the responses of patients who had been studied and given iagnoses by the psychiatric staff of the University of innesota Hospitals.

REVIEW OF LITERATURE

Much has been written since 1940 on the use of the inventory. McKinley and Hathaway[2] emphasized the e of the method in general medical or surgical practice aid to the physician in sorting out neurotic patients in evaluating neurotic states in patients with organic ease.

In a careful comparative study of personality questionnaires in general, Ellis[3] concluded that this test appeared to be the most promising, because its derivation was on an objective basis. Leverenz[4] gave the test to 76 neurotic patients who had been given psychiatric diagnoses prior to testing. The results corroborated the c ical diagnosis in approximately 95% of these ca Using similar methods, Benton[5] secured less freq agreement but concluded that the test was satisfacto distinguishing psychopathic deviates and homosexual tients. It was less successful in his hands in distinguis patients with hysteria and schizophrenia. Modlin[6] te 500 persons to evaluate the device. He found poor relation between the clinical diagnosis and the hig score on the inventory for a given subject, but good correlation when the clinical diagnosis was so among the four highest inventory scores for that per He emphasized that single abnormal categories on test were not so significant as the whole test pr Michael and Buhler[7] stated that the inventory doe replace interviewing and psychiatric judgment.

Various phases of behavior have been studied b test. Hewitt[8] used it in testing 37 members of Alcoh Anonymous. He concluded that deep-seated perso disorders were common among this group, the prominent being the psychopathic deviate, but that holism is also often associated with neurotic, parano schizoid trends. In a study of adaptation of army off Abramson[9] concluded that there was some correl between high scores on the inventory and lack of ad tion.

A relatively small number of case reports deal the use of the test by physicians outside the psych field. Houk,[10] in a series of case reports selected fro inventories in private practice, concluded that it a valuable aid in recognizing neurotic patients and i porting a clinical diagnosis. Henderson and h workers,[11] in an experimental study of dietary restr used the inventory to evaluate changes in emo status in their subjects. They reported changes i neurotic scales on the test when the subjects we deficient diets. These changes were substantiated clinical impressions of observers. Brozek and hi leagues[12] used several devices, including the inve to study personality during experimental vitam deficient diets. No change in personality was recor any tests with patients on partially restricted diet when patients were placed on diets with severe restriction, striking deterioration was shown by al used. Deterioration as shown by personality test ceded metabolic, cardiovascular, and neuro changes. In a study of persons with prolonged sym

ving head injuries Ruesch and Bowman [13] found eatures common to the group: abnormal scores on ieurotic scales of this test and large numbers of e complaints. They concluded that social malad- ent is related to accident proneness and to delayed ery. The inventory was used in conjunction with views by Ruesch and his colleagues [14] to study per- ity in patients who had undergone thyroidectomy. ry had been well tolerated by those with stable per- ities, but recovery from surgery was poor in patients evidence of hysteria or anxiety. Walch and ider,[15] using the test on 550 private patients, found aluable aid in identifying and measuring personality tions and stated that it is helpful in discussing diag- with the patient.

PROCEDURE

our study the test was given to patients in whom it suspected that subconscious stress (neurosis) was ucing symptoms. A much larger number of patients presented diagnostic problems during the period of tudy were not given the test because the diagnosis urosis seemed unlikely. In many of these the symp- were due to nervous tension, but the sources of stress ed clear and the question of deep personality dis- rs was not raised.

ie case histories in the patients given the Minnesota tiphasic Personality Inventory are compared as to the clinical and psychometric diagnoses. The data are ier broken down to show the various neurotic cate- s encountered, the presenting symptoms, and the ces of stress.

DEFINITION OF TERMS

or clarity several of the terms used here must be de- l. The term "reactive neurosis" is used to apply to the nt whose symptoms were due to thoughts or environ- tal situations that were emotionally overstimulating. patients are exemplified by the woman who had ied to fear her mother's asthma over many years and then recognized asthmatic symptoms developing in elf. The ensuing anxiety led to additional distressing otoms. Other patients had experienced symptoms re- ding them of coronary heart disease or other physical ise and had developed additional symptoms from the ety thereby produced. Several patients were living ncongenial environments that were so irritating in ous ways that symptoms resulted. In each of these in- ces the symptoms of nervous origin can be consid- as being largely a reaction to stimuli of which the ent is aware.

he term "neurosis," when used unqualified by the ctive reactive, is applied to nervous or emotional ion arising from subconscious conflict. These patients unable to identify the opposing forces in such conflict, iuse these forces are buried or suppressed.

n evaluating the subjects of the present study several ents were found whose symptoms seemed to arise n inherent hypersusceptibility to minor stimuli. Some hese patients gave evidence of being highstrung and vously overresponsive. Such persons have often been sified as constitutional inferiors or psychopathic in- ors. In the terminology used here persons in this up are called the constitutionally susceptible.

It has long been recognized by physicians that organic disease will in many instances markedly alter the emotional reactivity of the patient. Nine of the patients in this study were believed to fall in this category. In these patients the nervous symptoms prior to the onset of disease were not excessive. The presence of organic disease lowered the threshold of nervous system response, permitting symptoms of emotional origin to arise.

RESULTS

Thirty-four patients, or about 50% of these subjects, had personality profiles that were rather abnormal (Table 1). For 25 of these and in an additional 2 with normal scores the symptoms seemed to relate primarily to subconscious conflict (neurosis). In the remaining nine patients who obtained abnormal scores it was concluded that the symptoms were produced by factors other than or in addition to subconscious conflict. It will be seen from Table 1 that five were included under neurosis with organic disease, two under reactive neurosis, and one each under constitutional susceptibility and organic disease. Fourteen subjects discussed conscious problems or conflicts that seemed adequate to produce symptoms. These patients were classified under reactive neurosis. Twelve of them had normal scores. In nine patients chemical changes (climacteric) or constitutional nervous lability seemed to explain the symptoms. In another nine, organic disease was present that was assumed to have lowered the threshold of nervous reactivity sufficiently to permit development of nervous symptoms. In a few patients (five) an abnormal profile and organic disease coexisted, each being presumably responsible for part of the symptom production. The charts of six patients allowed no satisfactory conclusion as to the cause of nervous symptoms. In these patients the profiles were normal, no stressful factors were evoked, no organic disease was found, and no evidence of constitutional susceptibility was noted. Psychiatric study might have given further insight into these patients but was not carried out.

TABLE 1.—*Diagnosis Compared with Scores of Seventy Patients on the Minnesota Multiphasic Personality Inventory*

Diagnosis	M. M. P. I. Score	
	Normal	Abnormal
Nervous tension from		
Subconscious stress (neurosis)	2	25
Conscious stress (reactive neurosis)	12	2
Constitutional susceptibility	8	1
Organic disease	8	1
Neurosis with organic disease	0	5
Unestablished	6	0
Total	36	34

In the 34 abnormal profiles obtained in this study, the great majority show elevations in the neurotic triad of hypochondriasis, hysteria, and depression, the most frequent abnormality being depression (Table 2). Single categories are recorded as abnormal 70 times. Eleven

subjects had abnormal scores on only one category, the majority on more than one, 10 patients on three or more. Several patients with high scores in neurotic categories obtained abnormal but less marked deviations on psychotic or behavior categories also. Two patients were unable to complete the test because of mental confusion; one was severely psychotic, the other had intracranial tumor. Psychotic-type profiles were encountered infrequently. Neurotic patients were classified according to the type of symptoms presented (Table 3). Pain of one kind or another was the presenting complaint in by far the largest number, with fatigue and nervous tension occurring frequently. The large majority experienced pain in one or more areas and also complained of general symptoms or other organ symptoms, representing the wide variation in reacting organs, with each person responding to nervous tension in his own particular way.

A smaller number of patients had a diagnosis of reactive nervous states. The threats to which these patients reacted were found to fall into certain categories (Table 4). Some of them had undergone experiences that aroused the suspicion in their minds that they had physical disease of serious import. In these patients the simple explanation that such disease could be disproved afforded satisfactory relief. In others the nervous symptoms arose as reactions to the presence of undesirable physical disease. It is apparent that conditions such as epileptic seizures, rheumatic heart disease, or disabling asthma may produce in many persons insecurity and frustration that result in symptoms. For these persons also, discussion leading to understanding of the relationship between symptoms and the emotional reaction to the disease was all that was required in therapy of the nervous symptoms. A third source of emotional stress in the group with reactive neuroses was environmental. These persons were reacting to situations and to personal relationships that were intolerable but from which they could not escape. They reacted emotionally to definable situations that threatened their existence or their stability.

Unable to complete test		2

Another diagnosis that was made occasionally was that of constitutional overreactivity. It became apparent that certain patients had normal emotional attitudes (with normal scores on the inventory) and were not reacting to overstimulating environments, yet were experiencing symptoms of nervous origin. The climacteric, both female and male, is one obvious p cause of such oversusceptibility to vegetative n reaction. Several charts contained notations reg the physical examination that indicated that the s seemed to have an intense or sensitive personality. I mention has been made in the general medical lit of the fact that human beings are not constructed a nervous reactivity. One may require relatively stimuli to produce responses; another may react slightest stimulus, such high reactivity represen prominent inherent characteristic. It is just as im therapeutically to recognize the skittish person as ognize an organic disease, for only by such reco is that person enabled to adjust his life to the r ments of his nervous system. In four of nine patien a diagnosis of constitutional susceptibility to r reaction, the overreactivity was due to the clim in three to constitutional nervous irritability, and others to an intense personality.

ctivity. Brain tumor, through the constant aggravating d pain as well as by direct tissue pressure or infiltra- ı, is well recognized as commonly producing symp- ıs of nervous tension. As for hypertension, peptic er, and arthritis, there is controversy as to whether nervous symptoms are secondary to the disease or disease is due to a disturbed emotional state. Regard- of origin, nervous symptoms are commonly observed hese patients.

n the five patients revealing both organic disease and abnormal score, the presence of neurosis in addition he physical disorder would probably have gone un- ognized. The nervous symptoms would have been sidered a part of or secondary to the disease state, l no further therapeutic efforts would have been made. e findings of an abnormal profile caused these patients be referred for psychiatric interview and treatment. Two patients who were regarded as neurotic after chiatric interview showed normal scores. These rep- ent obvious failures of the test to record the neurotic tudes. Four patients with abnormal scores were, in final evaluation, considered to have nervous symp- ıs from causes other than neurotic attitudes. Two of se were thought to be reacting to environmental ss, one to be constitutionally susceptible, and one have nervous symptoms from organic disease. Psy- ıtric interviews were not conducted with these pa- ıts, as it was not considered essential to therapy. ıfirmation or refutation of the test results is not there- e available in these patients.

COMMENT

n the evaluation of the causes of symptoms presented a patient to the physician, much reliance has been ced on what is commonly spoken of as the "art of dicine." Step by step the art of earlier generations of ysicians has been replaced by the science of medicine, the advantage of both the patient and the physician. recent years understanding of the psychological ects of disease has been developing rapidly. This lerstanding has reached the point at which it is pos- le to develop an objective approach to the analysis personality deviations.

The advantage to the physician of an ability to evalu- personality traits is obvious. Functional symptoms quently simulate organic disease. Many abnormal per- ıalities are extremely difficult for those untrained in ychiatric methods to recognize. Several patients with rmal scores were believed at first examination to be ffering from a neurosis. With further study of these tients we have learned of environmental circumstances ıich are, for that patient, unbearable. The patient with normal emotional balance who has symptoms as a sult of conflict with the environment is a patient whom ery physician, equipped only with common sense and understanding, can advise. The patient with a pronounced emotional imbalance due to conflict within the personality is usually beyond the ability of the physician to evaluate, much less to manage with benefit to the patient. Such inner conflict arises frequently from failure of emotional growth at various stages of personality development. Much psychiatric insight is required to evaluate such growth failures. The day has long since gone when the well-intentioned physician could, when a physical examination has given normal results, tell the patient to "go home and forget it."

As a result of this study my diagnostic evaluation of psychosomatic states has been greatly improved. In patients whose complaints would previously have been diagnosed vaguely as functional disorders the origin of nervous tension can now be recognized frequently. In patients with abnormal scores the physician is given strong supporting evidence for a diagnosis of neurosis or psychosis. In patients obtaining normal scores the physician will be encouraged to seek other causes for the symptoms, in additional study for organic disease, in further evaluation of the patient's ideological stresses, or in estimation of his inherent susceptibility to psychosomatic reaction. This has given rise to better sorting of patients for psychiatric reference and better insight into the simpler psychosomatic problems by patient and physician, leading to more satisfactory results in therapy.

During the collection of these data I was surprised to see the paucity of psychotic scores. Other clinicians have since reported similar impressions. The psychotic patient does not seek out the physician nor does he experience the distressing physical manifestations presented by the neurotic.

Perhaps the greatest advantage of a psychometric device to the physician untrained in psychological medicine is the fact that just as laboratory data simplify the diagnosis of other diseases, so may a psychometric procedure simplify the diagnosis of a psychogenic state. The laboratory data themselves do not diminish the need for clinical judgment but provide objective data on which judgment may be based. The Minnesota Multiphasic Personality Inventory similarly will not of itself diagnose a patient's psychological condition, but it will relate the patient's personality characteristics to clinical psychiatric entities, giving the physician additional data on which to base a diagnosis. To approach an accuracy in the diagnosis of a neurosis comparable to that provided by the test would require considerable special training in psychiatry and at least an hour's searching conversation with every patient.

SUMMARY AND CONCLUSIONS

Seventy patients from a private medical practice whose symptoms suggested neurotic illness were given the Minnesota Multiphasic Personality Inventory to evaluate the use of this device as an aid in diagnosis. The scores of these patients were tabulated according to final clinical evaluation. The original impression of neurosis was confirmed in 27 patients, was present in addition to organic disease in 5, and was denied in 38. In the latter group the causes of nervous symptoms were found in stressful environments, constitutional susceptibilities, or lowered nervous thresholds produced by organic disease.

Further data are given on the scores of the 27 patients with neurosis. The scores were abnormal mainly in the categories of depression, hypochondriasis, or hysteria in various combinations. Patients with psychosomatic symptoms are seldom psychotic. The commonest symptom of neurosis in these patients was pain, with fatigue and nervous tension rather common. A very wide range of organ reactivity is noted, each patient responding to emotional stimulation with the reaction of particular organs characteristic of him.

For those patients whose symptoms are produ subconscious stress (neurosis), psychiatry offers a u adjunct in treatment. For patients whose nervous sy toms are not of this type, the general physician's i will usually be sufficient. The Minnesota Multip Personality Inventory affords the diagnostician a to useful in the diagnosis of neurosis as laboratory ai the diagnosis of organic disease.

CONTROLLED VERSUS FREE DIET MANAGEMENT OF DIABETES

James Lee Wilson, M.D., Howard F. Root, M.D.
and
Alexander Marble, M.D., Boston

The type of treatment and the degree of control of the diabetic state most desirable for optimal management of youthful patients with severe diabetes has long been the subject of much debate. That the duration of diabetes is an important factor in determining the incidence and severity of degenerative vascular lesions among diabetic patients is a well accepted fact. However, our experience has led us to believe that continuous, aggressive treatment directed toward maintaining physiologic conditions, including normal levels of blood sugar, is of the greatest importance in reducing the incidence and severity of degenerative complications.

Several recent articles have advocated a regimen of management which by our standards falls far short of being adequate therapy.[1] These plans of treatment, in general, allow a more or less free selection of food and disregard of hyperglycemia and glycosuria as long as ank symptoms and acidosis are absent. Many factors ust of necessity be considered in any over-all evaluation of the status of control of any individual patient. It is our opinion that "ideal" control of diabetes implies that a measured diet providing adequate amounts of vitamins, minerals, and calories derived from a correct proportion of carbohydrate, protein, and fat, has been so well utilized by means of an adequate insulin effect that blood and urine tests made regularly are invariably normal.

During a study recently completed,[2] the correlation between the degree of control maintained and the incidence and severity of degenerative vascular complications was determined in more than 300 youthful patients with diabetes of long duration who were recalled to the office or the hospital for observation and examination. Analysis of the results of this study has supplied support fo concept that persistent aggressive treatment of dia will definitely postpone or prevent vascular comp tions in these youthful patients. The present paper sents a further analysis of the data in these patients special reference to their over-all type of managem

We have divided 221 of these patients into groups, according to the type of treatment and the d of control that each patient followed in the manag of his diabetes. All patients who had had diabetic on one or more occasions, regardless of the cause type of management followed at other times, were sidered as a group illustrating poor control ar referred to hereafter as the "coma" group. Wi exceptions, the patients in this group had had c ently poor control of diabetes. All patients who a followed the type of careful treatment recommen them by us and our associates were similarly cons together as a group representing "controlled" trea The third group comprised those patients who, o own volition, had followed a "free-diet" regimen of agement similar to that advocated by Tolstoi and None of the 100 cases included in this third grou ever been in coma or severe acidosis as determin a review of their clinical and laboratory records co years of office and hospital visits. All were taking i in amounts varying from 30 to 120 units daily an following a free-diet type of management, without lar examinations for sugar in the urine or blood. In patients hyperglycemia and glycosuria were usually ent whenever occasional tests were made. Each three management groups was further subdivid cording to the duration of the diabetes into 10 year group, 15 to 20-year group, and 21 to 3 group.

After establishing the above-mentioned grou sought to determine in this series of patients the inc and severity of the two most commonly observed lar complications of diabetes which can be objec evaluated, retinopathy and calcification of peri arteries. Other degenerative changes were observe considerable frequency in many of these same pa but the accurate interpretation and evaluation of complications (except for renal involvement) wa

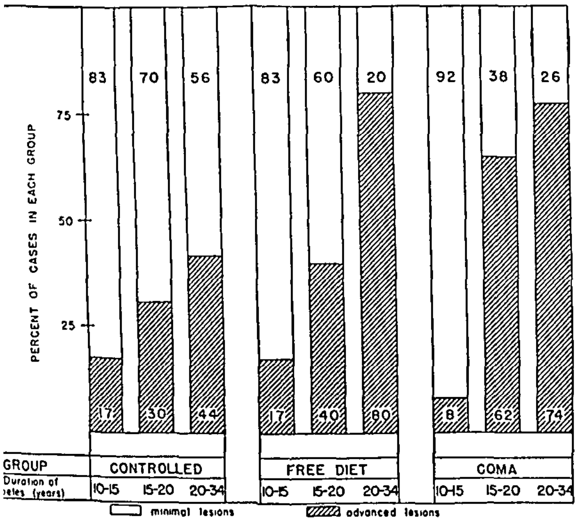
and the changes were therefore not easily subjected atistical analysis. Diabetic retinopathy was found to ne of the earliest degenerative lesions constantly rved in these young diabetic patients. The various tive findings of certified ophthalmologists after uscopic examinations were classified as follows:

rmal: Normal fundi with no hemorrhages, exudates or sis.
ade I: Few tiny punctate hemorrhages, no exudates.
ade II: Many punctate hemorrhages, few small hard or xudates.
ade III: Many punctate and some large superficial hemor- s, many large and small exudates.
ade IV: Most advanced retinitis with new vessel forma- and proliferation (retinitis proliferans).

ification within the walls of blood vessels often t demonstrable by roentgenography until after other ifestations of vascular degeneration are observed. n seen, however, this finding affords definite objec- evidence of blood vessel involvement by the degen- ve process. The roentgenograms of all these patients evaluated and graded (normal to Grade IV) accord- o degree of vascular calcification observed in films e aorta and of the pelvis and legs.

OBSERVATIONS

he incidence and extent of vascular calcification is elated in Figure 1 with the type of management fol- ed and the duration of diabetes. It can be seen that r 20 or more years, 74% of the patients in the coma p showed calcification of advanced degree and 80% ose in the free-diet group showed advanced lesions. he other hand, among those in the controlled group was a strikingly lower incidence of advanced ges (44%). Within each of the three groups there an increasing incidence of vascular calcification with asing duration of diabetes.



. 1.—Correlation of the incidence and severity of vascular calcifica- with three types of management of diabetes.

n Figure 2 the incidence and severity (minimal or anced) of retinopathy are shown in the three groups patients. Within each group separate tabulation is de to show the effect of duration of diabetes. It will oted that after 15 years of diabetes there was a higher incidence of retinal lesions in patients in the coma and free diet groups than in those in the controlled group. Except for the controlled group, with increasing duration of diabetes there was a corresponding increase in degree of retinitis.

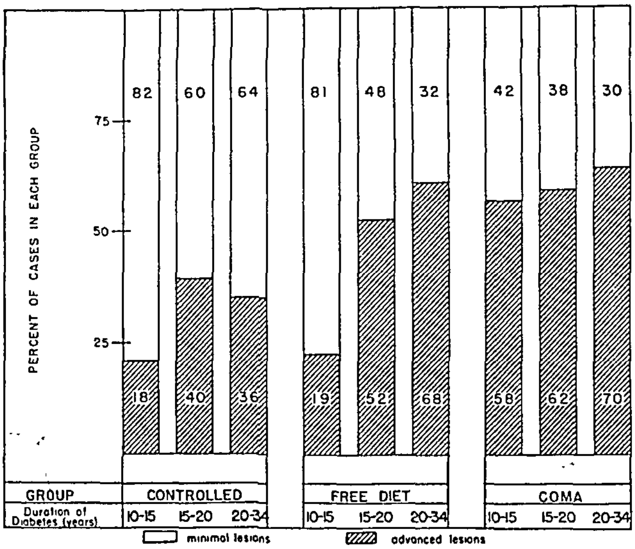


Fig. 2.—Correlation of the incidence and severity of retinal lesions with three types of management of diabetes.

Joint Correlation of Retinopathy and Vascular Calcification with Type of Management.—In analysis of the data just presented it became evident that in certain patients retinal lesions were minimal or absent, although definite vascular calcification was observed; in other patients, the reverse was seen. It appeared that more accurate tabulation and fairer comparison of the three groups of patients could be made if the patients were grouped according to the consistency of the degenerative lesions observed. Three groups were established: (*a*) "Minimal," which included all patients with retinopathy or vascular calcification of no greater severity than Grade I; (*b*) "Advanced," which included those with either Grade IV retinopathy or Grade IV calcification, or with both complications of Grade II or greater; and (*c*) "Intermediate," which comprised patients with inconsistent severity of lesions. The results of this tabulation are shown in Figure 3.

It will be noted that the data in Figure 3 are presented somewhat differently from those in the two preceding figures. The basic arrangement is according to duration of diabetes with three groups recognized: 10 to 15-year, 15 to 20-year, and 20 to 34-year group. Within each group the extent of retinopathy and calcification jointly present is tabulated according to the three types of management previously discussed (coma, free-diet, and controlled).

Study of Figure 3 reveals the following: (*a*) Within the 10 to 15-year and 15 to 20-year periods, there was no significant difference in the incidence of advanced degenerative lesions among the three management groups. However, in the 20 to 34-year period a significantly higher incidence of advanced lesions was seen among the patients with poorer control. (*b*) Among the patients with diabetes of 20 to 34 years' duration, advanced lesions in both the eyes and blood vessels were observed more than twice as frequently in the coma and free-diet groups as in the controlled group. Also, in the group with diabetes of 20 or more years' duration, only 7% of patients managed by a free-diet regimen had minimal vascular complications, whereas 41% with controlled diabetes showed only minimal lesions. (*c*) In the coma and free-diet groups, the incidence of advanced lesions increased progressively and strikingly with increasing duration of diabetes, whereas in the controlled group there was *no increase* from the 15 to 20-year to the 20 to 34-year period. Fifteen per cent of the patients in the coma group of 20 to 34 years' duration had minimal vascular lesions as compared with 7% in the free-diet group (Fig. 3). Although the number of patients concerned is small and the difference possibly not significant, it may reflect the fact that a few of the patients included in the coma group had been in coma on only one occasion while the remainder of the time they had conscientiously attempted to follow the careful type of treatment recommended to them and had been fairly well controlled for years; these now showed minimal, if any, vascular degeneration. This represents a vastly different situation from that of patients who maintained a persistent hyperglycemia and glycosuria and therefore a constantly disturbed metabolism under the free-diet regimen of management.

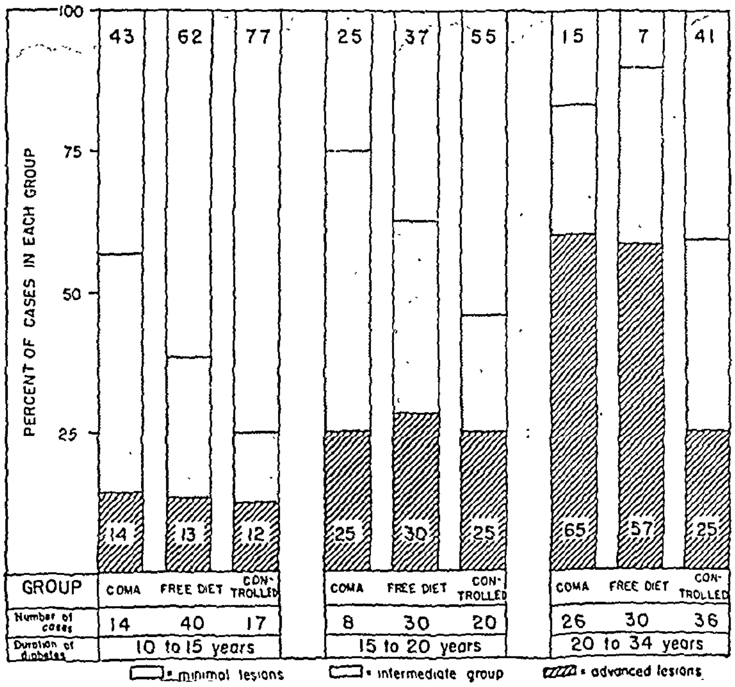

Fig. 3.—Joint correlation of the incidence and severity of retinopathy and vascular calcification with three types of management of diabetes.

No patient who followed a free-diet type of management had both normal retinas and absence of calcified blood vessels after 20 or more years of diabetes.

Relationship of Nephropathy to Type of Management.—In addition to the complications of retinopathy and vascular calcification analyzed above, the incidence and severity of renal disease occurring in these same
were noted with particular attention directed to
tionship between this complication and the type
agement of diabetes. Sixty-two patients had clinical
festations of diabetic nephropathy. A study of this
has been reported recently.[3] None of the 73
who had consistently maintained a satisfactory
control of diabetes was observed to have manifest
of nephropathy. Only 13 (20%) of the 62 patients
renal disease had made any attempt at control
betes. The remaining 49 patients (80%), had fol
a free-diet form of treatment or had been in co
one or more occasions. The importance of this
lar complication of diabetes must not be underestin
since it represents the chief cause of death in mo
50% of young patients with diabetes of long dur

debility than all other causes in this group of pati

Regardless of the type of management, 10 to
of diabetes are usually required for the develop
significant degenerative lesions.[5] Therefore, it
among patients who have had diabetes for mo
15 or 20 years that a true picture of the relation
tween the type of management and the incide
severity of degenerative vascular lesions can be o
Consequently, in any study to determine the
effects of various types of management, attention
be directed to those patients who have had diab
20 years or more.

Attention to control of diabetes should begin ea
aggressive treatment should be maintained conti
from the time the diagnosis is first made.

SUMMARY

Two hundred twenty-one young patients with
diabetes of 10 to 34 years' duration, with onset
18 months and 30 years of age, were studied to
mine the correlation between the type of mana
and the incidence and severity of the two most co
observed degenerative vascular complications (
athy and arterial calcification). Comparisons we
between the vascular status of three groups of p
(1) a "coma" group made up of those who had
or more attacks of diabetic coma, (2) those w
followed a "free-diet" type of management, an
"controlled" group comprising those who had
tained careful regulation of their diabetes. The
parisons revealed the following:

1. An increase in the frequency and severity of
erative vascular complications of diabetes comme
with increases in duration of the disease occurre

2. For any given duration of diabetes, there
significantly lower incidence of advanced dege
changes among those patients who had maintaine

[5] Root, H. F.; Sinden, R. H., and Zanca, R.: Factors in the Rate of Development of Vascular Lesions in the Kidneys, Retinae, and Peripheral Vessels of the Youthful Diabetic, Am. J. Digest. Dis. 17: 179 (June) 1950. White, P., and Waskow, E.: Arteriosclerosis in Childhood Diabetes, Proc. Am. Diabetes A. 8: 140, 1948. Root, H. F.: Diabetes and Vascular Disease in Youth, Am. J. M. Sc. 217: 545 (May) 1949.

ntrol of their diabetes. Also, for each ensuing decade duration of diabetes, the effects of differences in type management became more significant.

3. No patient who followed a free-diet regimen of anagement showed both normal retinas and absence of lcified blood vessels after 20 or more years of dia- tes, whereas 8% of those in the controlled group did.

4. After 20 to 34 years of diabetes, more than 57% patients in the free-diet group showed advanced degenerative changes, whereas only 25% of patients in the controlled group had such lesions.

These observations definitely support the concept that continuous, aggressive treatment, directed toward maintenance of physiologic conditions, is a better form of management of diabetes than the free-diet plan, which permits a constantly disturbed metabolic state, reflected in persistent hyperglycemia and glycosuria.

CHRONIC STRESS AND PEPTIC ULCER

I. EFFECT OF CORTICOTROPIN (ACTH) AND CORTISONE ON GASTRIC SECRETION

Seymour J. Gray, M.D., Ph.D., John A. Benson Jr., M.D., Robert W. Reifenstein, M.D.
and
Howard M. Spiro, M.D., Boston

Since the advent of corticotropin (ACTH) therapy, a mber of reports have appeared describing massive gas- ic hemorrhage or the development, reactivation, or rforation of peptic ulcers during prolonged cortico- opin administration.

The purpose of this communication is to present evi- ence that the chronic administration of corticotropin roduces an increase in gastric acidity and gastric pepsin ith subsequent peptic ulceration, perforation, or hem- rrhage. The studies to be presented indicate, moreover, at chronic stress affects the stomach by a hormonal echanism which is mediated through the adrenal gland.

It is well established that chronic physical and emo- onal stress leads to the release of corticotropin by the ituitary and that corticotropin in turn stimulates the drenal cortex to secrete a variety of steroid hormones cluding cortisone and closely related compounds.[1] The peated administration of corticotropin over a period time simulates chronic stress, since it elicits many of e same responses as those of sustained alarm.[2]

The occurrence of gastrointestinal ulceration is an in- gral and prominent part of the alarm reaction in re- onse to a number of stress factors such as nervous and notional stress, temperature changes, muscular exer- on and fatigue, infections, burns, anoxia, shock, and tracranial lesions.[3] All of these alarming stimuli may e associated with an increased incidence of gastro- testinal ulceration, perforation, or hemorrhage.

The relationship of prolonged emotional stress and larm to gastroduodenal ulceration and chronic peptic lcer is well documented.[4] The significantly increased cidence of perforated peptic ulcers in England and weden during the heavy air raids[5] and the increased ncidence of peptic ulcer in England, Germany, and witzerland during World War II[6] are ample evidence f the role of stress in gastrointestinal ulceration.

The pathway by which emotions and other forms of tress are transmitted to the stomach is generally con- idered to be neurogenic by way of the vagus nerve. ystemic stress and emotional stimuli such as rage, fear, nd anxiety are expressed, under cortical control, through he hypothalamus and relayed to the vagal centers by eural pathways. Stimulation or excitation along the course of the fiber tracts from the anterior hypothalamus to the vagal centers produces gastric erosions, perforations, or ulcers accompanied with hypersecretion and hyperchlorhydria.[7]

The hypothalamus, however, may also play an essential hormonal role in the response to stress which is independent of nervous pathways and forms a key link in the release of corticotropin by the pituitary. Recent studies indicate that in response to emotional and systemic stress the cells of the anterior hypothalamus secrete a humoral substance which stimulates the pituitary to release corticotropin.[8]

The studies to be presented indicate that emotional stress and anxiety may also induce gastrointestinal ulcer-

ation by a hormonal mechanism through the hypothalamic-pituitary-adrenal-gastric axis (Fig. 1).

The reported cases of ulcer production, perforation, or hemorrhage during corticotropin therapy in most instances occurred after the "chronic stress" of corticotropin administration for seven or more days. Beck and his associates reported an acute perforation of a duodenal ulcer occurring after seven days of corticotropin therapy (100 mg. daily) in a patient with previously negative x-rays of the stomach. Generalized peritonitis associated with severe retrosternal burning, nausea, and vomiting occurred in a second patient after the administration of 150 mg. of corticotropin daily for 20 days.[9] Heller and associates observed two patients with perforation of a duodenal ulcer following corticotropin therapy. Neither of these patients had any past history of gastrointestinal symptoms or disease. The first patient received 225 mg. of cortisone daily for five days approximately two weeks before admission to the hospital and then suffered a duodenal perforation after receiving 60 mg. of corticotropin daily for two and one-half additional days. The second patient received 3,100 mg. of cortisone over a period of 16 days before her ulcer perforated.[10] Fli also observed a perforated peptic ulcer in a patient wi no antecedent history after chronic corticotropin the apy.[11] Warren noted massive gastric hemorrhage in a arthritic patient with no previous ulcer history wh received 1,200 mg. of cortisone over a period of ni days.[12] Habif, Hare, and Glaser reported an acute perforation of a duodenal ulcer in a previously asymptoma patient who received 80 mg. of corticotropin daily for a total of 29 days.[13]

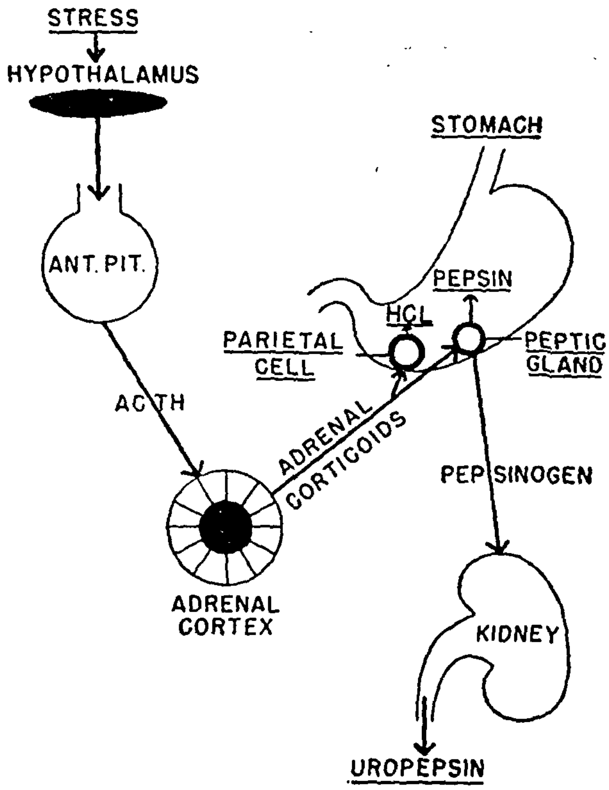

Fig. 1.—Hormonal pathways by which emotional and physical stress may affect the stomach, resulting in an increased production of gastric hydrochloric acid and pepsin.

Although it is difficult to be certain, there is no evidence that any of the above patients had a duodenal ulce prior to hormone therapy and one patient had a previously negative x-ray of the stomach.

Activation of a previously existing peptic ulcer wa reported by Smyth in three instances. The ulcer of on patient had been healed and quiescent for nine yea but perforated after he received 75 mg. of corticotrop daily for five days. Autopsy revealed acute and chron ulceration with perforation of the duodenum associat with acute and chronic inflammatory reaction. Reactiv tion of ulcer symptoms associated with sudden seve pain and melena was observed after 22 days of cortic tropin therapy (2.84 gm.) in a patient who had be asymptomatic since the demonstration of an ulcer cra six months previously. A third patient experienced seve excruciating pain four days after corticotropin thera (100 mg. daily). This patient had a gastric ulcer a presented evidence of localized peritoneal reaction bef the hormone was discontinued.[14] In two patients wit previous history of peptic ulcer deeply penetrating ulc requiring surgical intervention developed after cortis therapy.[11] A fatal massive gastric hemorrhage occur in a patient with meningitis who received 1,700 mg cortisone over a period of seven days. Autopsy revea that the hemorrhage originated from an exacerbatio an old healed duodenal ulcer.[12]

METHODS

Corticotropin was administered intramuscularly doses of 100 to 160 mg. daily for a period of 3 to 4 we to six patients with essentially normal stomachs, one tient with a gastric ulcer, and one patient with a hea duodenal ulcer.

Three hours after a light evening meal a Levin t was inserted into the stomach and continuous 12-h aspiration was instituted in accordance with the met described by Levin and others.[15] On the following mo ing the tube was left in place and the stomach aspira by continuous manual suction. The first specimen discarded and then three to five consecutive 15-mi aspirations were obtained with constant suction follow the method of Bloomfield and others.[16] Consistent umes of gastric secretion were obtained during th serial 15-minute aspirations. Identical conditions alw prevailed in subsequent aspirations during corticotro therapy. The diet was kept constant and whenever p sible the aspirations were performed by the same op ator. During the aspiration the fasting patient recei nothing by mouth and no belladonna alkaloids or se tives were administered. The end of the tube was p tioned roughly in the lower fundus. The collected j was immediately placed in an ice bath. The studies w restricted only to patients who tolerated intubation w

The continuous 12-hour nocturnal gastric secretion d the basal morning fasting secretions were obtained on least two occasions before corticotropin therapy was stituted in order to establish a base line control. The idies were repeated at weekly intervals during the ministration of corticotropin and were again repeated veral weeks after corticotropin had been discontinued order to establish the level of secretion during the covery period. The adrenal response to stimulation was nfirmed by eosinophil counts and 17-ketosteroid excre- n studies. The volume, consistency, and blood and le content of each specimen were recorded. The pH is determined with the glass electrode, and free hydro- lloric acid and total acidity were determined by titration ith 0.1 N solution of sodium hydroxide, using Töpfer's agent and phenolphthalein as indicators. Pepsin was termined by the method of Bucher, Grossman, and y.[17]

Continuous 15-minute serial aspirations for one hour (basal secretion).

Coincidental 24-hour uropepsin excretions were deter- ined by a modification of the method described by ucher, Mirsky, and Anson.[18] Urine specimens were ollected on frequent occasions during the period of rticotropin administration and for approximately a eek prior to and following corticotropin therapy. The fect of cortisone on uropepsin excretion was determined four subjects with normal stomachs who received 200 500 mg. of cortisone daily for 4 to 18 days.

RESULTS

Effect of Corticotropin upon Gastric Acidity.—The ontinued administration of 100 to 160 mg. of cortico- opin daily for a period of 7 to 21 days produced a arked increase in the basal gastric secretion of hydro- hloric acid (Table 1) as manifested by an increase in e average free and total acidity in clinical units, output f free hydrochloric acid in milligrams per hour, and a ecrease in the pH of the gastric juice.

The clinical units (c. u.) of free hydrochloric acid increased 100 to 330% with a mean increase of 208% in the basal fasting secretion obtained by continuous aspiration of serial 15-minute samples. Total hourly secretion of free hydrochloric acid, expressed as milligrams, increased 175 to 510% with a mean rise of 270% during the administration of corticotropin. The increase in gastric acidity was delayed in one patient (O. D.) until 21 days of corticotropin administration, while in others the acidity rose within the first week. A marked increase was noted within seven days in patients J. A. and H. E. (Table 1).

The dramatic increase in gastric acidity observed during corticotropin administration and the fall to control levels after corticotropin was discontinued is demonstrated in Figure 2. The increase in gastric acidity represents a true increase in acid concentration, since the volume of gastric secretion did not rise significantly during corticotropin administration. One patient (B. F.) had 0 to 7 units on two occasions prior to corticotropin administration. After 14 days, the mean free acidity rose to 70 units with an hourly secretion of 242 mg. free hydrochloric acid. Three weeks after corticotropin therapy was discontinued, the free acidity fell to 0. The gastric acidity returned to precorticotropin control levels in all instances after discontinuation of corticotropin therapy (Table 1).

The nocturnal 12-hour gastric secretion similarly demonstrated a profound increase in free acidity within 7 to 21 days of continuous corticotropin administration (Table 2). The mean rise in clinical units was 162% with an average increase in milligrams of free acid of 235%. The volume of the 12-hour aspirations did not increase appreciably during corticotropin therapy except in one patient with a healed duodenal ulcer (C. U.). The gastric juice volume and concentration of acidity were both increased considerably in this patient (Fig. 3).

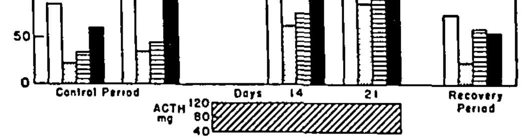

Fig. 2.—Effect of corticotropin (ACTH) on gastric acidity (basal secretion) in one patient (I. N.), demonstrating the increase in free hydrochloric acid during corticotropin administration.

Lab. & Clin. Med. 35: 899, 1950.

When corticotropin was discontinued, the 12-hour secretion of acid returned to control levels (Table 2).

Effect of Corticotropin on Gastric Pepsin.—A similarly significant increase in the concentration of gastric juice pepsin was observed in the serial 15-minute basal aspirations during 7 to 21 days of continuous corticotropin administration (Table 3). The mean pepsin concentration in five of the seven patients studied rose 182% and the pepsin output per hour increased 209% but, after discontinuation of corticotropin, both values returned to the precorticotropin control levels.

* Continuous 15-minute serial aspirations (basal secretion).

It is of considerable interest that there was no significant rise in pepsin concentration in two patients (H. E. and C. U.) in spite of a marked increase in the gastric acidity (186 to 263%) in both instances. The hourly output of pepsin rose in the peptic ulcer patient (C. U.) because of an increase in the volume of gastric secretion during corticotropin administration (Table 3).

The 12-hour continuous nocturnal secretion re
a 168% increase in the mean total pepsin output o
12-hour period. Although the volume of the 1
aspirations increased approximately 100% duri
administration of corticotropin to the patient (C
with a healed peptic ulcer, there was in addition a
cant increase in the pepsin concentration as well
total pepsin output (Figure 3).

Corticotropin and Uropepsin Excretion.—Th
pepsin excretion in the urine reflects the peptic
of the stomach. It is derived from the secretion
sinogen directly into the blood stream by the pep
of the stomach. Pepsinogen is then transported
kidneys and is excreted in the urine as uropepsi

That uropepsin has its origin in the stomach
denced by the disappearance of the enzyme fo
total gastrectomy and by its absence in the u
patients with pernicious anemia.[19] Thus, the peptic
of the stomach may be considered to have an en
as well as exocrine function. Uropepsin represe
endocrine activity, while the gastric pepsin repres
direct secretion of the gastric glands into the s
lumen.

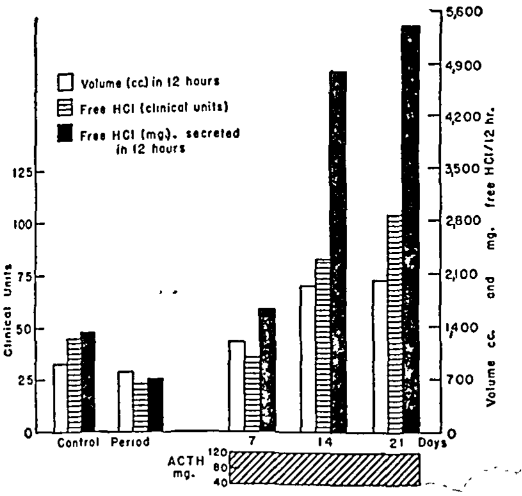
R.: Clinical ACTH Conference: Proceedings of First Conference, Philadelphia, The Blakiston Company, 1950, pp. 177-183; ACTH and Gastrointestinal Enzymes, Bull. New England M. Center **12**: 169, 1950. Spiro, H. M.; Reifenstein, R. W., and Gray, S. J.[18d]

evious studies in this laboratory have demonstrated orticotropin injected into normal subjects produced rked increase in the 24-hour excretion of uropepsin oximating 126% (Fig. 4).[10]

e oral or parenteral administration of 250 mg. of one daily to normal subjects produced a rise in



3.—Effect of corticotropin (ACTH) on gastric acidity (12-hour noc- secretion) in one patient (C. U.), demonstrating a dramatic increase secretion of hydrochloric acid to the active ulcer level. An active ıal ulcer developed in this patient two months later.

epsin excretion similar to that obtained with cortico- n. The average increase was 88% and was observed ost instances within 24 to 72 hours.

e increase in uropepsin excretion paralleled the rise stric juice pepsin in patients receiving corticotropin nually for periods of 7 to 21 days (Table 4). The uropepsin increase was 194% compared to an ge rise in pepsin concentration of 182%.

IPLICATIONS OF CORTICOTROPIN ADMINISTRATION

rrelation of Complications with Gastric Acidity, n, and Uropepsin.—Corticotropin was administered muscularly to a patient with a gastric ulcer in doses mg. four times a day for 10 days. Shortly thereafter patient presented definite evidence of impending ration with localized peritonitis, and there was ed aggravation of her ulcer symptoms with an in- e in the white blood cell count from 8,500 to 00, the appearance of guaiac-positive stools, severe le spasm, and exquisite localized tenderness in the strium.

is exacerbation of ulcer symptoms on corticotropin py was associated with an increase in gastric pep- rom control levels of 570 to 600 units per cubic meter of gastric juice to levels of 1,500 units on the nth day of corticotropin administration. The average in output rose from control levels of 51,000 units hour to 120,000 units. After corticotropin therapy discontinued, the pepsin fell to the original level prior erapy (Table 3). There was no significant change in volume of gastric secretion during corticotropin ad- stration.

he increase in gastric pepsin was accompanied by ncrease in urinary uropepsin from control levels of 0 units per 24 hours to 10,270 units during the re exacerbation of epigastric distress. After corticotropin therapy was discontinued and the patient became asymptomatic, the urinary uropepsin returned to the previous level of 4,795 units per 24 hours (Table 4).

A significant increase in gastric acidity occurred during the exacerbation of symptoms during corticotropin administration (Table 1). On the eighth day, the clinical units of free acid increased from 28 to 80 units and the output of free acid rose from control levels of 85 mg. to 234 mg. per hour.

When corticotropin therapy was discontinued, the patient became asymptomatic and a gastric resection was performed several weeks later. Microscopic examination of the specimen revealed a new acute penetrating ulcer at the site of the old gastric ulcer with early hemorrhagic necrosis of the scar—an acute exacerbation of a chronic ulcer.

CASE 1.—R. I., a woman aged 66, entered the hospital with a history of a gastric ulcer, diagnosed and treated for two months in another hospital. The patient apparently had had the ulcer for about five years. She presented the classic symptoms of epigastric pain occurring several hours after meals and relieved by ingestion of food. The patient was awakened occasionally at night by the pain. Roentgenograms revealed a gastric ulcer on the lesser curvature of the stomach. Gastroscopy confirmed the diagnosis. The gastric ulcer could be seen clearly on the lesser curvature of the anterior wall. The ulcer was approximately 1 in. (2.54 cm.) in diameter and was approximately ⅜ in. (0.95 cm.) in depth. The impression was gained that this was a benign lesion.

Treatment and Course: The patient was treated with a regimen of ulcer management consisting of milk and cream and a preparation of aluminum hydroxide gel with magnesium trisilicate and had a prompt response. Her symptoms cleared and she felt quite well. The ulcer management was then discontinued except for the ulcer diet and frequent feedings of milk and cream. The patient remained essentially asymptomatic.

Corticotropin was then administered in doses of 25 mg. four times a day. Within 24 hours the patient began to complain of a recurrence of her ulcer pain which was decidedly aggravated during the night and was associated with much flatulence and lower abdominal distention. After three days of hormone administration, there was pronounced epigastric tenderness and a localized area of protective muscle spasm which had hitherto not been present. The gnawing epigastric ulcer distress still persisted. After five days of hormone therapy, there appeared to be definite evidence of peritoneal irritation, as manifested by an area of severe muscle spasm and exquisite localized tenderness in the epigastrium. The patient complained bitterly of pain, which doubled her up on occasions. She felt that the pain was partly relieved when she drew up her legs.

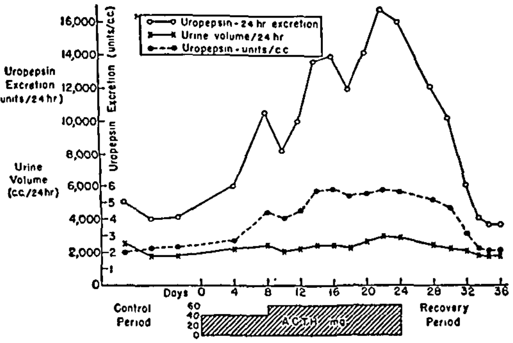


Fig. 4.—Effect of corticotropin (ACTH) on uropepsin excretion in one patient (A. D.), demonstrating an increase of uropepsin excretion to the active ulcer range during corticotropin administration. This patient died of a massive gastric hemorrhage and duodenal perforations during a subsequent course of hormone therapy for rheumatoid arthritis.

On the sixth day of hormone administration, it was believed that there was definite danger of perforation and localized peritonitis. The white blood cell count had risen from 8,500 to 15,000 and the stools became guaiac-positive although there was no significant fall in the hematocrit. The patient consequently was placed on a regular regimen of milk, cream, and aluminum hydroxide gel with magnesium trisilicate. This gave her partial relief, but she still complained of definite ulcer pain, particularly severe at night. The pain, tenderness, and physical observations that suggested a localized peritoneal reaction remained unchanged. After 10 days of administration of 100 mg. of the hormone a day, all medication was stopped. The roentgenograms revealed no change in the size of the ulcer, and there was no evidence of healing gastroscopically.

The patient was then given frequent feedings of milk and cream and Sippy powders. Within a few hours all her pain disappeared and she became essentially asymptomatic. Within 48 hours the localizing signs in the epigastric area had disappeared and the patient was quite comfortable. After several weeks, a gastric resection was performed and the ulcer in the stomach was found to be perfectly benign.

Microscopic Examination: There was an acute, recent ulcerative necrosis of the mucosa with its base in the surface of the muscularis. The base was composed of fibrinoid necrotic cellular debris in which were scattered disintegrated polymorphonuclear leukocytes. The immediate underlying muscle contained polymorphonuclear leukocytes and lymphocytes and fairly numerous capillaries and fibroblasts were growing radially into the base of the ulcer.

The muscularis beneath the ulcer had previously been thinned by a dense fibrotic process which extended out to the subserosa. In this subserosa and to some extent in the outer part of the scar there was considerable hemorrhage. There were many prominent blood vessels, large and small, that extended from the serosa well into the scar and muscularis. Similar vessels were seen in the muscularis and just beneath the ulcer, running at right angles to the axis of the stomach. All of these vessels were densely surrounded by lymphocytes and plasma cells. Smaller vessels in the scarred area were congested and contained numerous polymorphonuclear leukocytes, many of which had begun to invade the vessel wall and in some instances had passed beyond the vessel wall. Many of these vessels in the hemorrhagic areas showed loss of continuity of the walls and their contents merged with the surrounding hemorrhage.

Summary: Chronic ulcer with acute exacerbation. At the site of the old ulcer there is a new acute penetrating ulcer with early hemorrhagic necrosis of the scar with resulting thinning of the muscularis and total width of the wall.

The second patient (Case 2) died of a massive gastric hemorrhage and duodenal perforation after four courses of corticotropin therapy for rheumatoid arthritis. On the administration of 40 mg. corticotropin daily dur first course of treatment, the uropepsin excreti creased from the pretreatment level of 4,200 u 24 hours to the unprecedented level of 16,740 u the 22nd day (Fig. 4). At this point, the patient c plained of ulcer-like burning epigastric distress, n and vomiting. When corticotropin was discontinued uropepsin fell precipitously to 12,200 units and grad returned to the control levels eight days later. Th crease in uropepsin excretion was accompanied an increase in the concentration of uropepsin fro average of 2.1 units per cubic centimeter during control period to 5.7 units on the eighth day of co tropin administration.

Normal persons excrete 1,500 to 3,000 units of pepsin daily. Patients with active duodenal ulcers us excrete increased amounts of uropepsin. Excreti 16,000 units, however, has never been exceeded in duodenal ulcer patient in our experience.

CASE 2.—A. D., a 23-year-old man, entered the hospital treatment of severe rheumatoid arthritis and amyloi During his hospital stay, the patient received four cours corticotropin intramuscularly. During the first course (Sep to Oct. 18, 1949), which consisted of 40 mg. daily for eight and then 60 mg. daily for 16 days, there developed in the pa nausea, vomiting, and epigastric distress, which slowly respo to an ulcer diet and Sippy powders. A gastrointestinal series gested antral gastritis but did not reveal an ulcer crater. The of corticotropin on uropepsin excretion is presented in Figu

A second course of corticotropin therapy from Nov. Dec. 28, 1949, consisted of 1,900 mg. over a period of 30 and was again accompanied with considerable nausea vomiting.

The third course of corticotropin was administered from 18 to Feb. 8, 1950, and consisted of 40 mg. daily for 19 and was complicated by a mild psychotic tendency. One m after this course had been completed, the patient began to plain of severe ulcer-like, burning epigastric pain and hematemesis. Despite negative gastrointestinal x-ray series, symptoms were quite refractory to ulcer management. was observed in the gastric contents which contained 44 of free hydrochloric acid.

In March, 1950, he became asymptomatic in respect t gastrointestinal tract and he was then given a fourth cou corticotropin therapy from March 23 to April 20, 1950 received 40 mg. daily for 20 days and then the dose was gra

ered off. Despite maintenance of a Sippy regimen, the
t complained of occasional heartburn which was re-
by milk and antacids. His appetite and food intake im-
l during this course. At the end of treatment, however,
nperature rose to 103.8 F. The next day bloody stools and
e hematemesis occurred after a bout of severe abdominal
Shock, anuria, and respiratory failure led to his death
24 hours.

opsy revealed blood in the stomach, a diffusely hemor-
gastric mucosa, and friable, hemorrhagic, necrotic areas
mucosa of the duodenum and distal ileum.

roscopic specimens revealed acute hyperemia and diffuse
rhage of the mucosa. In one area there was superfiicial
is of the mucosa with a polymorphonuclear leukocytic re-
. Considerable bloody serum was seen adherent to the
of the mucosa. Most of the microscopic findings were
l to the mucosa and submucosa. No thrombi were ob-
and none of the deep vessels showed evidence of
.

rther Clinical Observations.—Two perforated duo-
ulcers were observed in a patient receiving 2,080
f corticotropin over a period of 19 days.

E 3.—T. K., a 54-year-old man, was admitted for corti-
in treatment of biopsy-proved periarteritis nodosa. After
ys of 100 mg. of corticotropin daily, several small
emeses developed. Treatment was continued, however,
the 10th day of therapy, the daily dose was increased to
g. On the 14th day of treatment, there developed in the
t severe right upper quadrant tenderness and spasm asso-
with ileus. Pruritic jaundice followed with elevation of the
alkaline phosphatase. Corticotropin was administered in
of 120 mg. daily for five more days and then was discon-
l after a total period of 19 days.

jaundice gradually diminished, but diffuse abdominal
ness, which had its onset after 14 days of corticotropin
y, persisted, particularly in the right upper quadrant. A
le abdominal mass associated with diarrhea developed in
tient and he died in uremia and pulmonary edema 15
after corticotropin had been discontinued, and approxi-
y 20 days after the onset of the abdominal pain.

opsy revealed two duodenal perforations, one 3 mm. in
n the posterior wall, about 1 cm. beyond the pyloric ring,
second perforation 1 cm. in diameter with irregular,
tic mucosa overhanging its margins about 2.5 cm. beyond
st perforation.

croscopic study revealed the wall infiltrated with lympho-
and plasma cells with only an occasional polymorpho-
ar leukocyte. A narrow zone of enzymatic digestion sur-
ling the perforation was observed and the wall here was
ated with lymphocytes and plasma cells. There was no
rterial infiltration or scarring. There was no fresh throm-
and no evidence of periarteritis nodosa.

e lack of polymorphonuclear leukocytes would indicate
his lesion was at least two weeks old. There was no evidence
preceding chronic duodenal ulcer.

massive fatal gastric hemorrhage developed in the
wing patient after he had received 3,160 mg. of
icotropin over a period of 76 days.

SE 4.—W. M., a 58-year-old male patient, was treated for
matoid arthritis and received 60 mg. of corticotropin daily
8 days, 40 mg. daily for 21 days, and then 60 mg. for 5
days, until discharged from the hospital on Nov. 15, 1950.
total hospital dose was 1,620 mg. over a period of 34 days.
ome he received an additional total dose of 1,540 mg. over
riod of six weeks, ending Dec. 28, 1950. On Dec. 29 the
nt suffered excruciating epigastric and substernal pain. A
k later hematemesis, mild shock, and abdominal pain fol-
d and were poorly controlled by methantheline (banthine®)
nide, transfusions, and Wangensteen constant suction. His
dition gradually deteriorated, with repeated hemorrhage and
tionality. He died on Jan. 2, 1951. The presumptive diagnosis was hemorrhage from a peptic ulcer because of previous x-rays demonstrating a duodenal ulcer and an ulcer history of five years' duration with symptomatic relief by antispasmodics and an ulcer diet.

GASTRIC COMPLICATIONS INCIDENT TO OTHER FORMS OF STRESS

Anoxia.—Anoxia itself constitutes a form of severe stress and may be associated with an acute gastric perforation similar to that seen during corticotropin administration. This was demonstrated in the following patient who had a gastric ulcer of several years' duration and suffered a perforation during a period of anoxia secondary to a coronary occlusion.

Case 5.—F. I., a 64-year-old white man, was known to have gastrointestinal complaints of 40 years' duration controlled on sporadic ulcer management. He experienced a gastric hemorrhage in January, 1948, and a gastrointestinal series and gastroscopy established the presence of a gastric ulcer on the lesser curvature of the stomach at the angulus. The patient became asymptomatic on ulcer management and remained free of symptoms for the duration of the history. In 1948 he also was found to have hypertensive cardiovascular disease with a blood pressure of 210/130 and a moderately enlarged heart.

The patient was completely asymptomatic until Sept. 17, 1950, when he suffered severe oppressive chest pain accompanied with sudden shortness of breath, weakness, cyanosis, and orthopnea. A diagnosis of acute posterior myocardial infarction was made by electrocardiogram. The patient was in shock for most of this hospitalization with the blood pressure dropping from 120/100 to 80/60. In spite of oxygen and the insertion of an airway, his breathing remained stertorous and he remained cyanotic and in shock.

Six hours prior to death, the patient complained of severe acute epigastric pain associated with signs of peritoneal irritation and abdominal rigidity. A Levin tube was inserted and guaiac-positive material was obtained. He was then given milk and antacid through the tube without relief of the distress. The patient finally died on the fourth hospital day.

Autopsy revealed an acute myocardial infarction of the posterior wall of the left ventricle, subsequent to acute and complete occlusion of the major coronary artery.

The stomach revealed a large encircling shallow ulcer 5 cm. in diameter beneath the cardia with a red-brown color and no fibrin over the surface. On the lesser curvature, 5 cm. from the pylorus, there was another large ulcer 6 cm. in diameter with a perforation about 1 cm. in diameter which extended to the peritoneal cavity The omental fat was adherent to the serosal surface in the region of the perforation. This perforated gastric ulcer was at the site of the previous chronic gastric ulcer observed over a period of two years prior to death.

Microscopic examination showed acute recent necrosis of the mucosa extending to the submucosa at the margins and through the muscularis at the site of the perforation. At the margin there was necrotic mucosal cellular debris, infiltrated by polymorphonuclear leukocytes, most of which were disintegrating. The base of the ulcer was composed of a layer of fibrinoid material containing polymorphonuclear leukocytic debris. Adjacent to this base were several veins and one artery whose walls were infiltrated by well-preserved polymorphonuclear leukocytes. The wall of one vein was necrotic and part of this wall had disintegrated. At the site of perforation the acute necrotizing process extended through the muscularis and stomach wall. There was no fibroblastic response anywhere in the ulcer; the vascular damage was more recent than the overlying ulcerative process, as evidenced by the newly infiltrated leukocytes, general lack of endothelial swelling, and no evidence of beginning organization. The mucosal ulcerative process was about 24 to 48 hours old, the deeper reaction in the vessels more recent.

The ulcer and perforation described were considered acute, but they could represent an acute exacerbation of an old chronic process.

The occurrence of massive gastric hemorrhage from a pyloric ulcer during the intravenous administration of corticotropin to a patient with chronic anoxia is illustrated by the following case.

CASE 6.—J. K., a 45-year-old man, a respiratory cripple with chronic asthmatic bronchitis and cor pulmonale, was admitted in severe respiratory distress with cyanosis, secondary polycythemia, and alkalosis. After bronchoscopic drainage and Drinker respiratory therapy had been instituted, 50 mg. of corticotropin was given intravenously over an eight-hour period. Twenty-four hours later, hematemesis and tarry stools appeared after a second such intravenous dose of corticotropin. Forty-eight hours after admission the patient died in shock from massive hemorrhage from a pyloric ulcer revealed at autopsy. There was no previous history of a peptic ulcer. Because of bronchial asthma, chronic bronchitis, and emphysema, the patient had suffered chronic anoxia and cyanosis for a number of years.

At autopsy the stomach and entire gastrointestinal tract contained black tarry blood. There was an ulcer of the anterior pyloric ring with slight surrounding induration about 1 cm. in diameter and 0.5 cm. in depth.

Microscopic section of the ulcer and pyloric region showed acute fibrinoid necrosis of the mucosa, submucosa, and immediately underlying muscle with infiltrating polymorphonuclear leukocytes which had degenerated. A number of small venules were eroded by this process in the floor of the ulcer. There was no fibrosis or evidence of chronic vascular disease or thrombosis. The histological age of the lesion was estimated at two days or less.

Brain Tumor.—An exceedingly high gastric pepsin and urinary uropepsin in the peptic ulcer range were observed in a patient with a tumor involving the hypothalamus.

CASE 7.—R. M., a 4-year-old boy, was admitted on Sept. 13, 1950, with a four-day history of dizziness, unsteadiness, and a staggering gait. There had been no history of gastrointestinal symptoms or disease previously. Ventriculograms on Sept. 19 suggested a posterior fossa tumor with fourth ventricular block.

The day after ventriculography the patient was drowsy and vomited a few times without hematemesis. On Sept. 25, fever of 103 F and a stiff neck suddenly developed. Lumbar puncture revealed cloudy cerebrospinal fluid from which alpha hemolytic streptococci were cultured.

Two days later, Sept. 27, 1950, as the meningitis was responding to antibiotics, grossly bloody coffee-ground material was aspirated from the stomach and the stools became tarry. A posterior fossa exploration, performed on Oct. 2, revealed an extensive medulloblastoma invading the hypothalamic area.

Postoperatively, the patient never regained consciousness. The gastric bleeding and tarry stools persisted until Oct. 25, when the stools became guaiac-negative following prolonged therapy with antacids and frequent tube feedings.

The gastric juice pepsin concentration on Oct. 21 and Oct. 28 were 1,076 and 1,636 units per cubic centimeter, respectively, and the uropepsin excretion was 13,580 units per 24 hours. Although the suspected Cushing's ulcer had supposedly healed, the patient's coma deepened and he died on Nov. 5, the 34th postoperative day. Autopsy permission was refused.

COMMENT

It is of considerable significance that corticotropin may produce, in normal persons, a level of gastric acidity and peptic activity commonly found in patients with an active duodenal ulcer. The average increase in the free acid, pepsin, and uropepsin each approximated 150 to 250% and reflected in most instances a rise in concentration. The administration of corticotropin to normal persons increased the basal secretion of hydrochloric acid
to the active duodenal ulcer level in every instan
to corticotropin administration, the average bas
tion, calculated on a 10-minute basis, was 31×10
hydrochloric acid, which agrees closely with B
field's data for normal persons.[16] During corti
administration, these same patients secreted 119
mEq. hydrochloric acid, which falls into the ra
active duodenal *ulcer patients.* The 12-hour noc
secretion of hydrochloric acid during corticotrop
apy also rose to the active duodenal ulcer level (T
2).

Patient C. U., with a healed inactive duodenal
secreted 5,550 mg. of free hydrochloric acid duri
ticotropin *administration,* which is an unprecedented
for an active duodenal ulcer patient (Fig. 3). Th
hour nocturnal volume of gastric juice increased
result of corticotropin, *to* 1,650 cc., which is con
ably higher than the average value observed in pa
with an active duodenal ulcer (Table 2). An a
duodenal ulcer developed in this patient two m
later.

The uropepsin excretion in normal persons rec
corticotropin also *increased* to levels commonly ob
in patients with peptic ulcer (Table 4). This was m
demonstrated in the patient who died of a massive g
hemorrhage and duodenal perforation following
courses of corticotropin therapy for rheumatoid ar
(A. D.). The uropepsin level increased from th
treatment level of 4,200 units in 24 hours to an ex
ingly high range of 16,740 units after 22 days of c
tropin therapy (Fig. 4). Although the gastric acid
not measured in this patient, it was probably in
considerably, in view of the data which have be
sented and the patient's ulcer-like symptoms wh
sponded to *antacid* therapy.

The necrosing and erosive *properties* of acid-p
gastric juice are well established. There is no reas
doubt that the continuous stimulation or overprod
over a period of days or weeks of highly acid g
juice rich in pepsin may result in a reactivation, pe
tion, or hemorrhage from peptic ulcer.[20] This was
matically demonstrated in one patient (R. I.), in
evidence of perforation and peritonitis *developed*
on corticotropin administration for 10 days with
companying threefold increase in *free* acidity
135% increase in the concentration and hourly
of gastric pepsin (*Tables* 1, 3, and 4).

The prolonged administration of corticotropin
tisone may subsequently present a *hazard* to patient
peptic ulcer. An x-ray examination of the stomach
to hormone treatment and the use of antacids su
aluminum hydroxide may be indicated whenever th
for several weeks is contemplated. Special caution
ommended in the hormone treatment of patients
anoxia and intracranial lesions, since corticotropi
cortisone constitute additional stress factors, as ex
fied *in* certain patients (F. I., J. K., and *R. M.*).

The development of hemorrhage, perforation,
activation of a peptic ulcer usually requires seven or
days of corticotropin administration. Review
literature reveals only the *exceptional case in* which
complications occur sooner. A similar time relati

; observed with respect to the effect of corticotropin acid and pepsin production. In most instances, the ximum acid and pepsin effect was observed after 7 14 days of corticotropin therapy, although in some ances 21 days of corticotropin administration were essary (O. D. and C. U.) (Tables 3 and 4). The adistration of 200 mg. of corticotropin intramuscularly 500 mg. cortisone orally to four active ulcer patients duced no significant change in the gastric acid or pepin the ensuing 24 hours. Apparently chronic and reted stress is necessary to increase the acid and pepsin tent of the gastric juice. An example of this may be increased incidence of perforated peptic ulcers during repeated air raids in England.

The characteristic microscopic picture of the stomach atients experiencing perforation, hemorrhage, or reivation of an ulcer during corticotropin administration ; that of an acute process with edema, hyperemia, rosis, and cellular infiltration of the mucosa and subcosa. There was no evidence of vascular disease or ombosis. The histology suggested an enzymatic and l digestion process rather than an underlying vascular ase and revealed changes similar to the ulcerative ons produced experimentally by the instillation of hly acid or acid pepsin solutions into the stomach. der these conditions, the mucosa is unusually sustible to ulceration, hemorrhage, or perforation.[21]

The effect of corticotropin on the stomach is due to secondary outpouring of adrenal cortical steroids her than to the primary action of corticotropin itself. tients with adrenal insufficiency, for example, show no tric response to corticotropin, but a definite effect was nonstrated with cortisone.[10] Cortisone and corticopin elicit an equal gastric response in normal persons, vever. The increase in gastric acidity or pepsin content ends, however, on an adequate steroid level. One pant receiving 30 to 40 mg. of corticotropin intramuscully every six hours for four weeks did not demonstrate all in circulating eosinophils or an increase in urinary osteroid excretion and failed likewise to experience an rease in gastric acidity or pepsin. The amount of corone necessary to produce a gastric response also varies different persons.

The importance of stress factors in the pathogenesis l chronicity of gastroduodenal ulcers has been estabied, and peptic ulcer has often been designated as a ess disease. The production of acute gastric and duoal hyperemia and erosions, sometimes with hemorge, is a characteristic manifestation of the first stage the general adaptation syndrome. Chronic stress, fear, d anxiety, as well as hostility and resentment, are assoted, moreover, with an increased secretion of hydroloric acid.[22] The exact relationship, however, between acute gastroduodenal erosion of the alarm reaction d chronic peptic ulcer in man has not yet been clarified.

Although the gastric response to stress is undoubtedly ediated in part, at least, through the vagus nerve, the idence presented strongly suggests that an additional rmonal mechanism is involved which is intimately assoated with the general adaptation syndrome.

It has been demonstrated conclusively that after biteral vagotomy, lesions in the brain stem are followed by focal hemorrhages in the stomach identical in all respects with those observed following brain stem lesions with the vagi intact.[23] Thus, there is good evidence that interruption of the vagal roots still leaves open a pathway over which abnormal or excessive impulses from the hypothalamic centers can exert a deleterious effect on the stomach.

As a result of emotional or systemic stress, the hypothalamus appears to secrete a humoral substance which stimulates the pituitary gland to secrete corticotropin. Corticotropin in turn activates the adrenal cortex to release a number of steroid hormones, including cortisone and cortisone-like compounds, which then cause the gastric glands to secrete acid and pepsin (Fig. 1). Whether these steroids act on the vagal nerve endings or are associated with other hormones such as gastrin remains to be determined.

SUMMARY AND CONCLUSION

1. Corticotropin (ACTH) administered intramuscularly to normal subjects in doses of 100 to 160 mg. daily for periods of three to four weeks produced a marked increase in the basal and nocturnal gastric secretion of acid and pepsin approximating 200%. In every instance, corticotropin increased the acid secretion to the active duodenal ulcer level. A similar gastric response may be induced with cortisone.
2. The maximum acid and pepsin effects were observed after 7 to 14 days of continuous corticotropin therapy. This coincides with the usual duration of corticotropin or cortisone therapy which precedes the reactivation, perforation, or hemorrhage from peptic ulcer.
3. The administration of 100 mg. of corticotropin daily to a patient with an active gastric ulcer produced definite evidence of impending perforation, localized peritonitis, and a marked aggravation of the ulcer symptoms. This was accompanied with a threefold increase in gastric acidity and a marked increase in gastric pepsin secretion.
4. The uropepsin excretion was increased during corticotropin therapy to levels commonly observed in patients with active duodenal ulcer. Unusually high uropepsin levels were observed in a patient in whom a massive fatal gastric hemorrhage and duodenal perforations developed during corticotropin therapy.
5. The prolonged administration of corticotropin or cortisone constitutes a hazard to patients with peptic ulcer. An x-ray examination of the stomach prior to therapy and the use of antacids are indicated in such cases. Similar precautions may be necessary in patients with anoxia or intracranial lesions.
6. The present studies suggest that chronic emotional and physical stress is transmitted to the stomach by a hormonal mechanism mediated through the adrenal gland and may induce gastrointestinal ulceration through the hypothalamic-pituitary-gastric pathway.

PROBLEMS OF PROLONGED CORTISONE TREATMENT FOR RHEUMATOID ARTHRITIS

FURTHER INVESTIGATIONS

and
C. Stevenson, M.D., New York

In September, 1949, our research group began investigations of prolonged use of cortisone and corticotropin (ACTH) in patients with rheumatoid arthritis, hoping to answer the questions: 1. Can cortisone and corticotropin be tolerated for long periods? 2. Does prolonged use of these hormones benefit the arthritis? 3. Is prolonged use of cortisone and corticotropin practical? In June, 1950, at the meeting of the American Rheumatism Association, experiences to that date were reported as observed in nine patients, three of whom received corticotropin and six of whom received cortisone for more than 100 days. These patients, then still being treated, had tolerated the hormone with only minor or no undesirable effects and with good antirheumatic benefit. Now, after 12 additional months, we make a progress report of further investigations. Although they are being continued and cannot be finally summarized, the number of cases has been substantially increased, and there has now been opportunity to observe the course of many patients after the hormone has been discontinued.

PLAN OF STUDY

of the greater facility of its prolonged use in y patients, cortisone has been employed in all ases during the past year, and this report deals only with the cortisone-treated patients. The hormone was administered orally almost exclusively during the last nine months of study.

The number of cases now reported on is 44 (25 women, 19 men). To be included in this study it was required that a patient receive the hormone uninterruptedly for more than 100 days. Seventeen were treated for more than 200 days; nine, for more than 300 days; four, for more than one year, the longest time being 406 days. In all instances, it was planned not to produce complete remission, but rather to effect only partial remission to the degree that the patient and physician considered desirable and sufficient to relieve most of the pain and stiffness and to improve function enough to substantially rehabilitate the patient. In this way, clinical and laboratory signs of the disease persist but are substantially reduced.

THERAPEUTIC RESULTS OF PROLONGED THERA

In general there was good, oftentimes excellent

'or patient M. R. (Fig. 3) cortisone acetate was used ly throughout and the good initial improvement has ı maintained even on a daily dose as small as 50 mg. complicating hormone effects have occurred.

MAINTENANCE REQUIREMENT OF CORTISONE

The cases described show the good antirheumatic effect during use of cortisone for prolonged periods. The amount required to maintain the desired effect varied from as little as 25 mg. at certain times in a few patients to more than 100 mg. daily; usually 50 mg. or more was required daily. In many patients a good partial remission could be maintained with 50 to 75 mg. daily. If more than 75 mg. daily was required for satisfactory effect we seldom continued treatment, for hormone effects other than the antirheumatic benefit usually made such complications that it seemed unwise to continue to administer cortisone. It was impossible to correlate the difference in maintenance requirement with the extent or duratiôns of

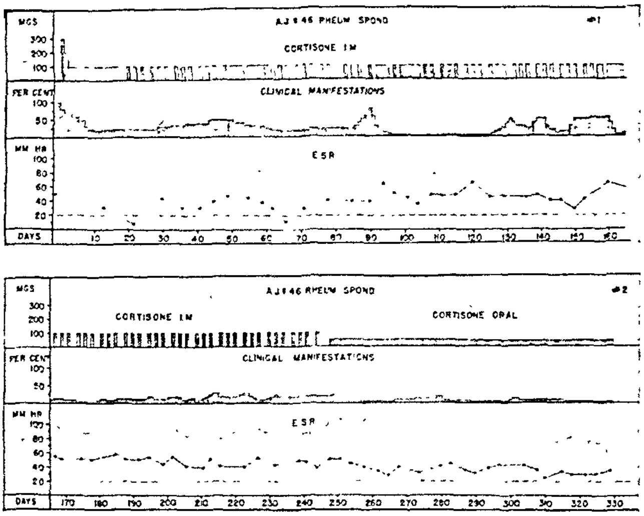

Fig. 2.—Dosage and effect of cortisone acetate given as "maintenance" treatment for a patient with rheumatoid spondylitis.

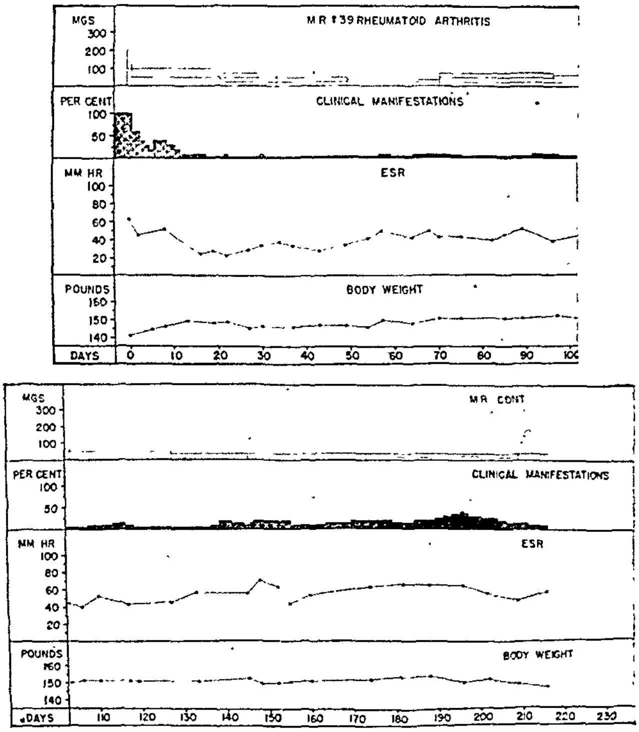

Fig. 3.—Oral administration of cortisone acetate as "maintenance" treatment.

the disease, the age, size, or sex of the patient. We came to regard the maintenance requirement of cortisone as paralleling the severity of the arthritis, even though the requirement did not correlate well with the pretreatment erythrocyte sedimentation rate. Also we realize how difficult it is to accurately determine severity of this disease, except as actually measured in terms of response to treatment, such as cortisone requirement.

"Maintenance" doses of cortisone acetate in amounts up to 75 mg. daily were usually well tolerated; although the longer the treatment was continued, the greater was the chance for trouble. By using no more than 75 mg. of cortisone acetate daily, complications were usually readily corrected or controlled; with larger daily doses, troublesome effects were sooner or later encountered from "hypercortisonism."

UNDESIRABLE SIDE-EFFECTS

Change of Facial Contour, Obesity, Hirsutism, Acne, Edema.—The nature and incidence of complications encountered in our series of cases are shown in Table 1. Rounding of the face occurred in 30% of cases, but it was usually slight; in only three instances was it objected to by the patient (grades 2 and 3). Tendency toward general obesity was a small problem in 18% of cases; it could be controlled with little difficulty. Hirsutism and acne were infrequent and mild. Edema was present to a varying degree in half of the patients; in most cases it was easily controlled by a low sodium diet, and, in some cases, the administration of ammonium chloride. In eight patients (those with edema grades 2 and 3) injections of a mercurial diuretic were required. Greater attention to adequate potassium intake was required when diuretics were employed. In two cases, grade 3 edema was difficult to control. The incidence of edema in this group of cases was higher than reported by some investigators, no doubt because a low-sodium diet and potassium or ammonium chloride were not routinely prescribed at the start of treatment, for we wished to determine by experience in how many patients develops while maintenance doses of cortisone are given. Because edema was encountered in only hal cases, it was thought wise not to impose these restrictions except when needed. Frequent measur of serum potassium revealed that in 9% of cas values developed. Orally administered potassium ride promptly corrected this abnormality and mai normal levels so that no complications due to lo potassium were encountered.

Hyperglycemia.—Disturbance of carbohydra tabolism developed in two patients. In one case, suria and elevated blood sugar appeared first du third week of treatment and never became wor grade 2; the abnormality was reasonably we trolled by dietary measures alone. The second began to show glycosuria during the fifth week ment; the metabolic disturbance became prog worse so that without insulin 120 to 180 gm. of would be excreted daily, and the fasting blood su to as high as 600 mg. per 100 cc. Even so, it is int that ketosis did not develop. In this case it was co wise to discontinue cortisone therapy because complication. Steady improvement occurred metabolic abnormalities after withdrawal of mone, but mild hyperglycemia persisted into post-treatment week.

Menstrual Disorders.—One-third of the 25 fe tients had irregular menstruation with scanty occasional dysmenorrhea, prolonged intervals, porary amenorrhea. These menstrual disorder source of worry, but always disappeared, if n treatment, after withdrawal of the hormone. menopausal, or early menopausal women, neur tory symptoms were often intensified (20% o patients). Estrogens usually relieved these sym

Mental Disturbances.—In planning prolong sone treatment we were considerably apprehe undesirable effects on the central nervous sy psyche. However, nervous symptoms occurre than one-third of the patients. This may be exp least partly by the fact that after the first few m this study, care was taken not to treat patients nervous or depressed, or who had had major di of this nature in the past. Moreover, careful se made throughout treatment for exciting or stimulating effects of the hormone. These effe considered indications for reducing the dose of h Insomnia was regarded as particularly importa other factor was that in all cases relatively small hormone were used. With these considerations teresting to note that only 25% of all patients con of nervousness or insomnia, which was relieved ing the amount of hormone. In only two pati there pathologic excitement; this was mild and when smaller doses of cortisone acetate were e Major depression occurred in only one patient instance it is probable that a depressed state wa vated by cortisone, for earlier in her life psychiat lems existed, and during cortisone administratio succession of psychic traumata occurred (deat patient's mother, a daughter's broken marriage ment, and the confinement of a son in a neurops ital). There is little wonder that a major depression ld occur. The patient reacted favorably to shock ment and a few weeks of psychiatric care after cor- e withdrawal. This patient, one of our early treat- t cases, would have been rejected for prolonged hor- e treatment in the latter part of the study.

chycardia.—A large variety of abnormalities affect- he blood and circulation were noted. Tachycardia the commonest. A pulse rate of 100 to 120 would ently persist in these patients without other clinical lectrocardiographic abnormalities and with no ges in the basal metabolic rate. We cannot explain achycardia; it may be due to the general stimulating t of the hormone. Usually within 7 to 14 days after ntinuing cortisone therapy, which was not done be- e of the tachycardia, the pulse rate reverted to the ortisone level. Various changes occurred in the elec- rdiograms of several patients, but these were not acteristic of any disease pattern.

evation of Blood Pressure.—In one-third of the pa- s elevation of blood pressure was noted, but this was lly in the order of 20 or 30 mm. Hg systolic and 10 5 mm. Hg diastolic, and in most instances did not to progress to hypertensive levels. Normal or slightly blood pressure would again obtain in the early post- isone period. In only 3 of 44 patients was blood pres- elevated to a moderately hypertensive level; it did continue to increase and treatment was cautiously inued.

elangiectasis and Purpura.—Telangiectasis appeared vo patients during cortisone treatment, and has per- d without other recognized abnormalities except ycardia in one of the patients. In five patients, small puric hemorrhages developed along the extremities, lly the legs. These ceased during continuance of tment.

emorrhage.—In two female patients there were sive hemorrhages into the gastrointestinal tract. One ese patients had had a peptic ulcer and had hemor- ed on two previous occasions. That not all patients have had ulcers get in trouble when cortisone is used own by the fact that in several other patients in our s who had ulcers, no activation of the ulcer or hem- age occurred during prolonged use of cortisone. The r patient of our group who hemorrhaged had no wn gastrointerstinal disease, but after cortisone was drawn because of the hemorrhage, an abdominal or became evident and was removed surgically. It a leiomyosarcoma. At the time of operation no cause bleeding could be found. On the third postoperative a cautious trial of corticotropin in small doses was at- pted because of hypotension, and again a massive orrhage occurred. Hence, it seems reasonable to con- r the bleeding due to effects of the hormone.

hrombosis.—Thrombosis of superficial leg veins was dly troublesome to two patients. In no patient of this up was there thrombosis of coronary arteries or car- c failure; in fact, in three patients treatment was bene- al and well tolerated when started within a few days er correction of congestive heart failure.

Summary.—It was of particular interest to us that betic metabolic disturbances and hypertension did not dually develop and progress late in prolonged treatment, as we feared might be the case. Instead it was our experience that troublesome diabetic and hypertensive changes made their appearance within the first few weeks of treatment if they occurred. We think it of significance but cannot explain the fact that the incidence and severity of complications were considerably greater among female patients. This is true with all types of side-effects, not just those associated with ovarian functions.

In this report, all complications encountered have been considered in relation to prolonged use of cortisone; however, it may very well be that some of these are in no way related to or the result of the hormone.

Treatment is being continued in 23 of our patients, and in the majority a fixed daily dose continues to maintain the desired effect. In only five cases (11%) has it been necessary to gradually increase the amount of cortisone after several months' use, to keep the desired antirheumatic effect. This has been in contrast to our experience with corticotropin, which we frequently needed to administer in gradually increasing amounts for maintenance of good effect.

TABLE 2.—*Status of Cases Studied*

Increased dose of hormone required	5
Treatment discontinued	24 *
Because of complications	6
Diabetes	1
Mental depression	1
Edema and poor benefit	2
Massive gastrointestinal hemorrhage	2
By choice	18

* Treatment resumed in some cases.

PROGRESS OF PATIENTS AFTER WITHDRAWAL

Opportunity to study post-cortisone events has been presented in the follow-up of the 24 patients in whom for various reasons, cortisone therapy was discontinued (Table 2). In six of these cases (14%) it was considered necessary to withdraw the steroid for the best interest of the patient because of troublesome complications. These were diabetes and mental depression, one instance of each; edema, which was difficult to control in two patients who had little antirheumatic benefit; and two instances of massive hemorrhage. It should be noted that five of these six patients were women. In 18 cases cortisone was discontinued because of convenience or by choice in order to study the post-hormone state. In a few of these cases treatment was resumed.

Duration of Remission.—Just as the benefits during treatment were usually gratifying, so the difficulties after prolonged treatment with cortisone were very disappointing and very discouraging to the patient and physician alike. These events need to be carefully studied (Table 3). In only 17% of the patients was the significant improvement that occurred during treatment maintained longer than 60 days after cortisone was withdrawn. In many of the patients relapse started when the daily dose was reduced below 50 or 25 mg. daily, in many others relapse began early in the post-hormone period. Within 60 days after treatment relapse to the pretreatment level had occurred in approximately 83% of the patients. It is thought that the small percentage of patients who continued improved after withdrawal of cortisone did so because natural changes of improvement occurred during the use of cortisone and continued long after discontinuance of the hormone, rather than because of any curative effects of the steroid.

Relation of Residual Benefits to Stage of Disease and Length of Treatment Period.—We were particularly interested in two groups of patients. It was hoped that if treatment with cortisone were begun early in the disease and continued for many months, the arthritis might continue suppressed after the hormone was withdrawn. Only two patients of the group had early disease; in both relapse occurred promptly after cortisone was withdrawn. Also, it was hoped that the longer treatment was continued, the more likely improvement would be prolonged after the hormone was discontinued; but relapse occurred as often in those patients treated 200 to 370 days as in those treated 100 to 200 days.

Temporary Suspension of Adrenal Function.—As was anticipated, after cortisone had been administered for a long period and withdrawn, there was indication that the patients' adrenal function was suppressed. This was shown in 40% of our patients by less than normal lowering of circulating eosinophils after corticotropin stimulus (Thorn test), by mild lowering of blood pressure, and by muscular weakness. But in no instance was this a clinical problem in these patients, and recovery of normal adrenal function occurred after two to six weeks.

TABLE 3.—*Post-Cortisone Events in Twenty-Four Cases*

	No. of Patients	%
Improvement maintained 60 to 190 days	4	17
Relapse to pretreatment condition	20	83
Within 10 days	6	25
10 to 20 days	8	33
20 to 30 days	4	17
30 to 60 days	2	8
Temporary hypoadrenalism	10	40
Severe "withdrawal syndrome"	5 *	21
Edema	3	12
Hip fracture	2	8

* Four women; one man.

Edema.—There were three instances of edema developing after treatment during which little or no edema had occurred. Two elderly men fell during the post-treatment period and fractured a hip. It is thought that weakness and clumsiness in walking during this post-hormone period accounted for the falls. The injury was sufficient to cause fracture of bone with average calcium content; weakening of the bone from calcium loss due to hormone is not considered to have contributed to the fracture.

Withdrawal Syndrome.—A most distressing illness occurred in 21% of patients after withdrawal of cortisone. This illness, which we call "post-cortisone-withdrawal syndrome," is characterized by severe relapse of the arthritis accompanied by disproportionally severe weakness and stiffness—greater than had been experienced previously—marked fatigue, anorhexia, mild hypotension, and a sense of great discouragement and depression. These patients were miserable; they usually stayed in bed for days or weeks and required assistance for most everything. The condition sometimes lasted longer than the indications of suppressed adrenal function and the bolic changes in connective tissue during the inter adjustment to the withdrawal of cortisone. Many of special therapy were tried but none were fou value in combating this "withdrawal syndrome. syndrome always subsided after two to eight wee some of the patients felt more ill than they had eve with the arthritis, and therefore volunteered that th not wish cortisone used again. Note that four of t patients who had this "withdrawal syndrome" women.

Emotional Readjustment.—Another troubl post-treatment problem was the necessity for the to adjust again to living with his disease, and t very difficult for some to do. We have long been im with the value to the patient of having a good phil of living with chronic arthritis. We have found this has been acquired, and the patient is then "holiday" from his disease by use of cortisone, it very difficult for him to adjust again to the post-tr worsening.

COMMENT

When cortisone is to be withdrawn, a slow re of dosage is advised whenever possible; for the me endocrinologic, and psychologic adjustments a better and more easily than following abrupt c If the latter is necessary, the patient risks serious because of suppression of adrenal function fo weeks, if a "stress" situation, such as a surgical op requires "adaptation." Fortunately, we encoun such circumstances, although the shock which from massive hemorrhage was difficult to manag

Our experiences with the method of prolonge cortisone herein reported cause us to feel th therapy is not practical for all patients with rhe arthritis. A better score for the favorable alter the disease is desired for any prolonged treatmen entails the risks during therapy and the potentia unfavorable events after cessation of treatment form of therapy affords. In further studies differe ment programs employing cortisone may be fou suitable than the one we employed; combina steroids may prove advantageous.

To obviate post-cortisone problems the indefi longed use of cortisone has been suggested, but not be a practical solution, because antirheumati from cortisone requires an excess of cortiso replacement of a deficiency. Hence it maintains degree of hypercortical adrenalism. No disease k the authors has been successfully managed for a nitely prolonged period by the production and nance of a hyperendocrine state.

Investigators realize the great possibilities for this powerful hormone in the treatment of rhe arthritis. Never before has such a potent antirh substance been available, but we need to kno how to use it. We think results indicate that our prolonged cortisone therapy is of value for a group of rheumatoid patients for a definite purp not for routine use for all patients with rhe arthritis. Although we are disappointed in the lin of this form of prolonged cortisone treatment, t discontinued interest in or use of, cortisone for eumatoid arthritis. But we feel that search for a more tisfactory and practical treatment program employing is or related steroids must continue.

CONCLUSIONS

Based on our experiences with prolonged use of cor-one in patients with rheumatoid arthritis, as we have ministered it, the following conclusions seem justified: many patients a good partial suppression of the disease n be maintained on 75 mg. or less of cortisone acetate, ally, daily. Usually this amount of the steroid is toler-d well; numerous minor undesired effects which may cur can usually be corrected or controlled, so that rious complications are infrequent. Treatment of 14% our patients, some receiving larger doses, had to be scontinued because of serious complications. These re more frequent and more severe in female patients. large amounts of cortisone acetate are required daily, e problems of hypercortisonism may become serious; erefore we prefer not to use cortisone as maintenance atment if more than 75 mg. is required daily.

Just as we have been pleased with the benefits of cor-one during its use, we have been very disappointed in e post-cortisone events. Relapse in 83% of patients, cluding those with arthritis of less than 6 months' dura-n, even after treatment for as long as a year; severe "withdrawal syndrome"; difficult post-cortisone readjustment to the worsened state of the arthritis—all these facts detract from the benefits of cortisone and diminish the enthusiasm initially held by patient and physician, for its prolonged use.

There is no evidence that the course of the arthritis is ultimately altered favorably by prolonged cortisone therapy as we used it. We do not consider cortisone practical as routine treatment for patients with rheumatoid arthritis, nor do we consider it adequate treatment in itself. Rather we choose to use it for a definite purpose such as to check rapidly worsening disease, or to facilitate physical therapy and rehabilitation. Whenever cortisone is employed, troublesome effects must be expected in some patients, and the physician should be prepared to meet them.

Initially we were concerned chiefly with the questions: 1. Can cortisone be tolerated for long periods by patients with a chronic illness? 2. Will it be beneficial? Now, 18 months after extensive trials, we are more concerned with the question: Will treatment with cortisone be worth while for this patient? We know we must consider what will happen not only during its use but also after the hormone is discontinued. Studies are continuing to clarify further remaining problems.

PLAN FOR RURAL MEDICAL SERVICES

George F. Bond, M.D., Bat Cave, N. C.

I should like to express my thanks for having the portunity to meet with this interested group in con-leration of the many aspects of rural life in the United ates today. The whole tone of this conference is serious, d that is as it should be for we are seeking means of proving the lot of more than half of our national pop-ation. The problems which are being discussed at this nference are vital to each one of these people, and it our duty to render the most complete and satisfactory dgments of which we are capable.

I am not sufficiently well informed to answer many of e questions which can be raised today with reference the medical care of our country people. At best I can ly survey these problems sketchily and in the time lowed today give you a summary of how a single rural mmunity faced and solved the problem of expanding own medical facilities. It is possible that in examining me of the facts which have been established by our periment in rural medicine we may reach some over-all nclusions which will help us in similar planning on a ationwide basis.

I should like to take a few moments to tell you some f the story of the growth of medical facilities in Bat ave, N. C. This collection of communities covers an rea, all of which is mountainous, of about 500 square iles, containing a population of about 6,000. The fami-es are widely scattered and until recently were without nedical services. The nearest medical facility is about 18 miles from the center of the territory. Road development was and is poor, electrification of the area is meager, and telephone facilities are only recently coming into existence. The general population is best classified as a farming population, and the average annual income is remarkably low.

On completion of internship, I elected to start general practice in this area, since I wished to do a rural practice and could find no locality more clearly in need of medical services. For about three years I maintained an office practice in Bat Cave and traveled a distance of 18 miles to the nearest hospital for surgery and treatment of those patients who required hospitalization. I found that I was driving about 175 miles a day, usually in a jeep, and that a 20- to 21-hour day was the rule rather than the exception. I found too that I was frequently being forced to practice bad medicine because of the lack of nearby hospital facilities and the element of sheer fatigue. This prompted me to increase the facilities in my small office to the extent that I was able to do some minor surgery and a few deliveries within the building. It was soon obvious that there was a very genuine need for a small hospital located approximately in the geographical center of the region. Neither I nor any of the people in the

Read at the Sixth National Conference on Rural Health, Memphis, Feb. 24, 1951.

scattered communities had had training in planning a hospital, but since it seemed to be needed, we had no doubt that the job could be done.

After selection of about 20 respected and hard-working men from all parts of our region, a meeting was called, the need of a hospital discussed, and preliminary plans made. It was agreed first that the group, which had been largely self-chosen, would be the original Board of Trustees of our nonprofit community hospital, and since many of them had been chosen for their abilities to organize construction details, it was understood that this building board might later replace itself with a group better fitted for the operation of the hospital after its completion. Realizing that it would be impossible to raise any substantial sums of money in our relatively poor community, we resolved to obtain, whenever possible, materials and labor for the project free of charge. Thus, each member of the board was allotted the project of obtaining a certain amount of lumber, rocks, hardware, and man power, and a preliminary period of locating and assessing the available materials was allowed. During this time we had a rare stroke of luck, which I believe may well be repeated in other communities. There was located in the center of our region an excellent schoolhouse of fire-resistant structure with approved water and sewerage systems which had been abandoned about 3 years after its construction and had lain idle for about 20 years. This spectacle of abandoned schoolhouses is ommon in rural areas as a result of school consolidation throughout the United States. With some maneuvering we were able to purchase the building and its grounds at open auction, where all other bidders were tactfully discouraged from competitive bidding. The entire structure and its grounds were purchased for the sum of 1,500.00, and the cash for this purchase was given by benevolent organization of a nearby town. Thus, we had the outer shell of a structure which was to become our community hospital. The building was roughly 100 by 50 ft., and during a few days spent with a friendly architect, we produced the floor plan and specifications of a 12-bed hospital within its walls. At our next meeting of the board the bill of materials for construction was parceled out as evenly as possible among the members of the board, the total hours of manwork needed were estimated and allotted, and the cash requirements were estimated as closely as possible. Preferring not to delay construction until such time as all materials, man power, and required money had been stock-piled, we elected to start on a shoestring and depend on the good will of the community and the enthusiasm of the workers to carry the job through. Within a period of nine months, through the most concerted community effort imaginable, the school building had been remodeled into a hospital, filled with equipment which was purchased at a low auction price from a defunct hospital, and made ready to receive patients. This was done at a total cash cost of slightly less than $15,000.00, or approximately $1,200.00 per bed, as opposed to prevailing cost estimates of $14,000.00 per bed for hospitals. The hospital is designed as a general hospital and has so far satisfied all necessary requirements in this regard. It was estimated that the 12-bed capacity should be sufficient for our region in view of the low utilization of hospital beds by most r
populations. Until very recently this has proved to b
sufficient number of beds for our purpose. Our nur
staff was recruited from nearby communities and w
composed of two registered nurses, two licensed practi
nurses, and girls whom I was able to train person
The remainder of our professional staff was made up
local people, all of whom had been with me for a y
or more of preliminary training. We opened our hosp
with no surplus in the bank and within a few months we
quite satisfactorily in debt. With the faith and assista
of the community and by hard work, we were able to
ourselves out of the red without sacrificing our resolve
treat all charity patients within our territory. So mu
then for the establishment of our hospital.

What work has been done in this hospital to jus
its existence? This in round figures is the record of
hospital over a two-year period of time: 10,000 o
patient visits; 500 surgical procedures; 400 fractures
duced; 600 accidents treated; 270 live births; 1,000 i
munizations; 18% free days of care to inpatients; 20
free care to outpatients; 12,000 laboratory procedu
performed; 1.5% newborn death rate; 0 maternal dea
0.1% surgical death rate; pediatric death rate, 3 dea
out of 600 admissions; medical death rate, 9 deaths
of 800 admissions; 3% referral of inpatients; 5%
ferral of outpatients; average patient stay in hospita
days; average occupancy, 9 patients.

These gross statistics seem to me to point out sev
important facts. With reference to the over-all statistic
figures of medical care, it can be seen that it is poss
in a year's time to give a very considerable amoun
service to the population which we supply, with ger
figures of mortality which compare quite favorably
almost any large hospital in the United States. I th
these low mortality figures do not give evidence of
perior medical treatment so much as they show that
patients are seen early in the disease process. It is
also that the turnover in terms of average stay o
patient is considerably less than that of most hospit
This is as it should be, since a rural hospital can
serve as a convalescent home but rather is able to p
vide only the most urgently needed medical servi

hospital conditions found in this area. It might be fa
said that if no medical facilities were available in

gion a large proportion of our sick patients would urney to a distant location to receive the same care hich today appears in our statistics. This may be true, it I am not convinced that a very large proportion of ir population would consistently travel distances of 18 20 miles for ordinary medical care. This has not been e case in years past, and I see no reason to expect such performance from the rural people in other localities the United States. If facilities are reasonably available, ey will be utilized; but if ordinary medical care inolves traveling long distances, uncertain financial arngements, and treatment in unfamiliar surroundings, I not believe that we can expect the majority of our untry people to seek medical treatment as often as cessary and as early as is proper. Finally, I believe that e statistics of our hospital indicate the one thing which stifies construction and maintenance of such a facility a rural area capable of supporting it. It is that we may certain that this hospital has been utilized to the fullt extent by the population which built it and owns it. his evidence of loyalty and general satisfaction is all at any hospital could require for continuing successful nction.

So much for the records of our hospital. I believe, as some others, that this record stands as fairly conncing proof of the value of a tiny rural hospital. We ive reached a cross road of opinion today on this queson. Most hospital administrators, whose training in the eld of small hospitals has been largely neglected and hose knowledge of the medical conditions which obtain nong country people is markedly deficient, will persist maintaining that any hospital under the 50-bed size a waste of time, energy, and finances. If we are to refute is misconception, it must be done soon, and I am connced that it can only be done by a study of actual orking records of small hospitals which are already nctioning. It is true that there is a great danger of ilding too many of these units and of locating some them in areas which cannot possibly support them. will take only a few mistakes in this line to set back e entire program of rural hospital construction a full cade. For this reason we must be extremely cautious the planning of a rural hospital system, and it would rtainly be better to have a small number of such units hich would prove their worth than to have a multitude white elephants.

So far I have considered whether or not a rural hostal is worthwhile and some of the factors involved in e construction of this unit. I have not mentioned the ost important item, the medical staff. A hospital withit a staff, albeit a one-man staff, cannot hope to function a hospital. Therefore, country physicians are needed staff these institutions. There is a severe shortage of ountry physicians, and the situation seems even worse hen it is reflected that only a small proportion of the en now practicing country medicine are trained to erve as a one-man staff in the units which have been escribed. This is not to be taken as a reflection on the bility of our present country practitioners but rather as n indictment of the system of medical training which btains in America today and of the system of practice hich does not permit the older country physicians to naintain adequate contacts with the newer precepts of medical practice. It is all too well known today that the average general practitioner is not prepared to practice the full range of medicine. The country physician required for a tiny rural hospital must be trained to do adequate obstetrics, general medicine, and to perform satisfactorily those surgical procedures which he will be obliged to do. It would seem to me that these are not impossible requirements for graduates of a grade-A medical school whose internships and residencies have been properly planned. Perhaps in our age of specialization we have overlooked the fact that a proper medical education necessarily embraces all of the fundamentals of medicine, surgery, and obstetrics, and that it is only through neglect or improper direction that a general practitioner is unable or unwilling to continue his training in all major branches of medical practice after he ceases his primary medical schooling. It will serve no purpose to deplore the preparation of our general practitioners today. We must recognize that unless we are willing to improve the training of our medical graduates and to direct them specifically in many instances to a complete general practice, there will be no need for the construction of rural hospitals since they cannot be staffed. These are facts, and no matter how harsh they may seem, they must be accepted and utilized if we ever hope to make progress in the field of rural medicine. What is the answer? The answer lies in the proper selection of a certain percentage of all admissions to medical schools on the basis of residence, previous training, and whether or not they wish and intend to practice rural medicine. Given a reasonable segment of such admissions, we must continue with a well-integrated plan of instruction in the general practice of medicine throughout all the years of the medical curriculum. Next, we must make available a large number of two- or three-year rotating internships tailor-made for rural practice. It is said that a genuine need will inevitably produce the desired end product. There can be no doubt of the need of properly trained rural practitioners; and it is devoutly hoped that the means by which these men may be trained will be shortly forthcoming.

Finally, if we secure the proper physician and provide him with adequate hospital facilities, we must attempt to establish an environment for this man which will encourage and improve his work, prolong his life, and make easier the lot of his successors. This is the responsibility of the community. In my lifetime I have seen the "grass roots" theory of community responsibility and growth fall to the lowest ebb in American history. This situation is perhaps a natural outcome of our recent national philosophy of consolidation, centralization, and total national security. No matter what else this state of mind produced, it certainly resulted in a temporary stagnation of collective community effort, and since the welfare of our nation is based not on the larger centralized portions of our civilization but rather on its tiny collective units, this trend has been disastrous. But it seems to me that lately there has been a renaissance of individual and group spirit. It is almost as if members of our rural communities suddenly awakened to the fact that they would perish if they did not return to old fundamentals of growth. In the last few years we have seen a tremendous resurgence of activity in our small-population groups, a reassertion of the pioneer spirit which built our country and has kept it strong. It is on this spirit and the known ability of communities to help themselves that I put my faith in the future of rural medicine. I am convinced that once a community sees the necessity of proper medical care and has bent its energies to the construction of facilities and to the acquisition of a physician, that same community will teach itself how to care for the very facilities which it has built.

Many of the medical habits which our country people must learn will seem unnatural and certainly will be difficult. They must understand that their physician can be a complete family physician although his practice does not permit him to travel at any distance from, or be for very long out of touch with, the community hospital. Our people must learn that the best medical care they can receive will be in the local medical center and that almost no one is too sick to be transported to these facilities. They must accept the fact that the days of long home calls, home deliveries, and home surgery are over and that it is only through the full utilization of the hospital which they themselves have built that these facilities will justify their existence. Finally, our country people must learn that it is within their power to kill their physician by abuse of his time and by lack of consideration of his needs for rest and occasional recreation. This sounds very much as if I were trying to inject into the pattern of country practice all the elements of the life of a city specialist. To a certain extent this is true, but I do not believe that these means of protecting the country physician and his workshop will in any way lessen the close familiar contact of the family physician with his people. It is this problem of community consideration which can best be nderstood by the representatives of rural life gathered e today, and it will be their task to aid in the useful cation of communities which are ultimately to receive oper medical care.

A word should be said about financing the rural hospitals the construction which I propose. Although I believe that modification of the construction and equipment standards which will be possible in these hospitals will result in lower over-all construction costs, it would be foolish to anticipate maintenance expenses lower than those of the larger city hospitals. When it is considered that fair salary requirements, high levels of charity care, and piecemeal purchase of equipment and expendables are all major factors in the story of hospital maintenance, it will be understood that an average figure of about $12 per day will be the cost of keeping a patient in a rural hospital.

Since these hospitals will be established in areas where the average per capita income is low, we must expect an operating deficit which will probably amount to about $600 per bed per year. This deficit can be met in part by regular subscribed assistance from the community which is served by the hospital and by a more satisfactory system of contracts with the welfare agencies for the care of indigent patients. There should also be some carefully controlled system of subsidies designed primarily to make up maintenance deficits of these units. These subsidies need not be large and certainly must be controlled at a community level, thus offering no opportunity for bureaucratic interference in the management of the unit; they will, nevertheless, be necess should be anticipated if the scale of rural hosp struction reaches the desired proportions. As a working figure, I should estimate that from c to one-half the deficit could be met by the comm and the balance could be wisely proportioned b county, state, and Federal government, with due p tion against unnecessary control.

If we then accept, as I do, the necessity of the con tion of adequate workshops for country physici the form of tiny, rural hospitals, we must exami means by which these *hospitals* can be establish maintained in our rural communities. I would s *that in the majority* of cases the wisest procedure be to establish regional health councils designed to a given population and/or geographical area, b necessarily limited by county lines. This health co representative of the major components of org rural life which have already been described, cou isfactorily survey the area within its jurisdictio make a wise decision as to the need of a rural ho for its people. It is to be emphasized that if the rural practitioners within the region surveyed health council, they should be carefully integrate the body of this council and their advice respecte physicians who are already established in rural could serve as spark plugs for hospital constructi could give valuable advice with respect to fa needed for their area. These same physicians shou be invited to determine the need for *specialist con* service to the hospital and must assist in all phase planning. It would not be wise in any locality community or the health council to proceed ind ently on a program of hospital construction with complete sympathy of the local physician or phys I stress the necessity of integrating the advisory s and good will of local physicians with any prog rural hospital expansion because I have seen in too *instances the barriers which can be set up* if ad qualified persons is ignored and antagonisms a Such a situation is neither to the credit of local pra physicians nor the health councils but unfortunate exist unless a carefully coordinated plan is follo must be understood that the future staff of the rur pitals may at first be comprised of men who have practiced medicine in the country for some len time. The wisdom and abilities of these men mu be ignored if the projects are to be satisfactorily pleted.

And now finally, despite my personal enthusia projects such as I have described, I must offer strong note of warning. It would be far wiser to lish the first hundred or so such hospitals in very situations, carefully prepared as regards constr details and complete future maintenance, than t bark on a program of haphazard hospital constr which will result in the eventual failure of some units. We must all appreciate the fact that it take a few failures in a plan of rural medical service the entire program back by a good many year since the plan described here is of a revolutionary opportunity should not be afforded for unjust cri

his can be avoided by the application of common sense
nciples. I would advise the careful location and estab-
ıment of a mere handful of prototypes of these country
;pitals in each state. These would serve as experi-
ntal laboratories to determine the eventual criteria by
ich we might round out a national plan. In this way,
ıough we would proceed slowly, our progress would
sound and would be based on the grass root principles of community expansion and improvement. It is on these principles that most of our enduring community assets have been established in the history of the United States, and by proper evaluation and utilization of community effort, we may hope to see the return of the country physician and the perpetual establishment of necessary rural medical facilities.

Bat Cave.

EVEN PHYSICIANS DIE

John Alan Appleman, J.D., Urbana, Ill.

[he term "estate planning" is not preferred by experts.
ıtate analysis" more accurately imports a study of the
blems involved in any personalized situation—the
n is the solution resulting only from intensive study.
: physicians are, perhaps, the poorest examples of
structive planning. They complain about taxes—yet
y do everything possible to throw their income and
ıte taxes into the highest possible brackets, with no
nd thought as to how to reduce them. Inevitably, they
in need of sound investments, but they seek no expert
ısultation and invest in almost any proposition ad-
ıced by a smooth promoter. They fret about their
'es' lack of sound business judgment, yet make no pro-
on for the solution of financial problems which are
tain to arise on their deaths—leaving widows with
ny headaches, little experience, and every opportunity
losing their security to the first slick-tongued salesman
o comes along. Physicians talk about possible retire-
nt but make no intelligent financial plans for the
ure.

[he typical picture of a young physician in these days
ıomewhat as follows. Young Dr. Jones, somewhat to
surprise, finds his patient list mounting rapidly. His
sonal friendships expand also, and the new friends
ıally are people who are also young and rapidly be-
ning successful. To entertain, and to have the swim-
ıg pool available for the family, Dr. Jones joins the
ıntry club. It is inevitable that the old Ford is traded
on a Buick—then young Dr. Jones needs another car
:ause the Buick is usually at the club or needed to pick
the baby sitter. Now the second child is about due, so
and his wife look about for a larger home. But all
: better houses seem to be two-story structures, and
:y are attuned only to a ranch style. So Dr. Jones buys
ot in the new subdivision near the club—perhaps he
n get in a few holes of golf after dinner. Then he has
me plans drawn for a modest residence. The cost is
:imated at $25,000; the building costs $42,000 when
mplete.

At this point Dr. Jones begins to do some serious think-
g. He goes over some figures. He now has $6,000 in the
', $42,000 in the house, $2,500 in architects' fees,
',000 in landscaping, and $6,500 in furniture, carpet-
g, and drapes. That totals around $60,000, which is
ırtly paid from his savings and the balance represented
/ a bank loan. Also, Dr. Jones has $4,000 invested in
ıtomobiles. He begins to figure worriedly that he has
ı establishment to maintain, large monthly expenditures to meet, and as yet has not invested a cent in any type of retirement program or life insurance.

Perhaps by sheer coincidence a life insurance salesman catches Dr. Jones in that mood. Whether the resulting sale is $25,000 or $100,000, whether it is 10-payment life insurance or ordinary life insurance depends on the conscience of the agent. His customer, the physician, has no conception of the type or amount of life insurance he should carry.

Now Dr. Jones begins to relax mentally. The monthly payments may now be even heavier, with the insurance program, but his clientele is steadily increasing. At this point a pressing desire gnaws at him. He begins to think how pleasant it would be to make money a little more quickly, to relieve any anxiety resulting from financial pressures. Some friends of Dr. Jones are going into a syndicate to drill a wildcat oil well. He invests $3,000. He goes down to watch the operations. The sands are promising. The big night he stays up until 2 a. m. to watch the well brought in. Then, suddenly the driller turns, shakes his head. It is a dry hole!

Dr. Jones drives home, somewhat discouraged. He had not really thought it could miss. Somehow he had envisioned only the royalty checks and not the possibility of failure. This has cured him, Dr. Jones thinks. And perhaps it has cured him of wildcat oil operations; if so, it was a cheap experience. But surpluses and their management continue to cause him disquiet. The thought of leaving money in a bank account to earn no dividends is unattractive; in addition, continuing inflation, he realizes, diminishes the value of his dollar savings. So Dr. Jones learns of the stock market. He establishes an account. In the meantime he finds an attractive farm—only $400 an acre, and he enters into a contract to buy it.

But, suddenly, one day, Dr. Jones feels a little faint. Disturbed, he takes his own blood pressure. His closest friend, a cardiologist, is pleased to see him, then alarmed by the anxiety he sees in his visitor's face. Tests and consultation follow, with the advice to take life easier, to relax more, and to reduce or eliminate those night calls.

But Dr. Jones now has forgotten how to relax. Not only does he now worry about the cardiac condition; he begins to worry about his obligations. There are the insurance payments to meet—no one had thought to suggest a waiver of premium provision [illegible] ility to him, or perhaps he had rejec [illegible] as [illegible] exp
But now his family
living. There are

tract payments to meet on the farm. Of course, overhead expenses for the office continue monthly and income taxes must be paid on his net income. There seems to be no escape; Dr. Jones feels that he must continue to work until some day Mother Nature puts an end to his labors.

This example could be complicated with a sudden depression, shrinking Dr. Jones' stocks and farm values. But Dr. Jones has complicated it enough. Suppose he should die now. Every asset—including the house, cars, farm, securities, and life insurance—will be included in the amounts forming the basis of his estate tax. Dr. Jones did not figure on that. They told him that if the house and farm were held in joint tenancy, they would go directly to his wife—that his life insurance was not a part of his estate at all. But they forgot to tell him that the tax man included in his computations all of these joint tenancies and the life insurance. So the life insurance, which young Dr. Jones had tied up to provide for the education of his children, may well conclude with a tax lien against distributive shares, and his widow, whom he thought had ample security from the other assets, may be forced to sell the securities, farm equity, and house at depressed prices to pay administration costs and taxes. She may be left penniless.

If this causes the reader discomfort, it is because it strikes too close to home. Such a picture is typical of the majority of physicians—some of whom survive to experience a few of these headaches, others of whom leave these problems to widows and heirs. Because of these acute taxation and personal problems, the field of estate analysis has come into being—a specialty combining elements of taxation, will review, trusts, investments, insurance, and many other phases of law and business. The physician will not find his solution in a simple will drafted by his family lawyer, or in the elementary suggestions of his income tax accountant. Even as he would refer neurosurgery patients to one competent in that field, he must himself consult a specialist.

What is involved in an estate analysis? The simplest definition of an estate analysis is that it is the making and analyzing of an inventory of a given person, his material and financial accomplishments, his powers, talents, and responsibilities, his aims and directives in life, and his spiritual desires. The assembling of that material constitutes what is called a "plan foundation," "data sheet," or "inventory." The second step involves the analysis of this material and the shaping of the vast amount of data into a theory of procedure which will solve the problems presented. The third step is the drafting of the instruments which place the estate plan into effective operation.

In order to accomplish these steps, complete cooperation of the client—let us assume in this discussion he is a physician—is required. It may require two weeks of the client's time, scattered in driblets of a half dozen conferences, considerable personal intensive thought and self-analysis, the compiling of materials and documents, scrutiny of the instruments prepared by the analyst, and like matters. A physician may begrudge the time necessary, but many a businessman may begrudge the convalescence following the removal of a brain tumor. He was given no choice; the thing had to be done. Here the analyst must have cooperation if he is to do that which is required.

In order to prepare a proper estate analysis fo
client, complete information must be secured b
estate analyst with the general assistance of the phys
and possibly his accountant, family attorney, inves
counsel, and life insurance underwriter; many o
sources of information may have to be contacted. M
of the information required can be secured from a
sonal examination of the physician's life insurance
cies, deeds, personal income tax returns, and the bal
sheet and tax returns of any business in which he ma
collaterally interested, without unduly burdening
with duplicative details. But whatever source may be
ployed prior to completion of the analysis, complete
is required. Such data includes complete personal i
mation concerning the physician, his wife, and e
member of the family and their expectancies, inclu
information concerning his and his wife's parents.
is vital for the preparation of any will or trust instru
and helps to give the estate analyst all pertinent f
data.

A complete analysis of the physician's assets an
come must be made, including the nature of each
of property. One may even find in this connectio
the physician has homes in different states. This is
important in determining the question of domicil
in considering conflicting and overlapping laws
may apply. As one of the physician's assets, insu
not only life insurance, but health and accident and
erty and liability coverages, must be disclosed. T
insurance policies should be turned over to the
analyst for personal inspection. Only in that wa
detailed information be secured concerning the p
and settlement agreements which are then contai
the policies and wise provision made for any chan
quired or thereafter needed. The insurance analys
show a woeful lack of coverage of specific properti
of various liability coverages, which should be adde
an illustration, the physician may own property wh
used for tavern purposes directly or indirectly, perh
social clubs, thus greatly increasing his hazards.

A complete disclosure of the physician's liabili
required, whether direct or contingent, in order th
vision may be made for the discharge of such oblig
His ordinary expenditures for living purposes,
tivities, membership in social organizations, and hi
tionship to gifts and trusts, whether created by him
his benefit or that of members of his family, must
vealed. A statement of income, assets, liabilities, a
pectancies of his wife, children, and both sets of pa
must be made.

With reference to personal information, as a
any proper analysis, information is needed of the
cian's health both in the past and at the present ti
hobbies, his practices with regard to vacations, a
retirement plans. It has been wisely stated that reti
is not an escape—one must retire to something a
from something. Only by ascertaining the intentio
desires of the physician can provision be made fo
contingencies. His desires in regard to administ
guardianships, and even funeral plans are then s
It the reader thinks those problems insignificant, I
mention that last year I saw a case in which a fam
most came to blows because the son thought his

ould be cremated, while his sister was violently op- sed to cremation. And, lastly, one must prod deeply ascertain the relationship of the physician with his nily and his personal desires with reference to each nily member, his relatives, employees, charities, or any ner subject of his bounty.

While there is no substitute for a personal examination the analyst of the documents, policies, and written in- uments which must be considered, nevertheless there is ll a tremendous task for the physician even with the sistance of the specialist and those who aid him. As- nbling the necessary material may require the physi- n to spend a great deal of personal time, but it is time ll spent. A businessman may spend a week taking an entory of his business once a year. A physician can tainly afford to take a week or more to take an in- ntory of himself. Not only may the result accomplish saving of tens of thousands of dollars in taxes, but it quires the physician to reexamine himself in his rela- nship with his professional associates and his family, redetermine his aims in life, and to see the direction in ich he has thus far traveled.

In addition to the documents which the analyst will pare from his study, whether they be wills, trust agree- nts, deeds, or other documents, it is well for there to a final instrument—one not destined for the eyes of curious public, but one to be cherished by those one ves behind. This is not an instrument in lawyers' lan- age but one in the roughhewn stumbling words which speak the sincerity of the husband and father. For in s instrument, the last contact he will have with his fam- , the decedent can extend a hand of love from beyond barrier of death. In this letter, let us call it, he reas- res those who are suddenly bereaved of his presence, d left feeling wholly helpless, of his enduring love; he nsmits courage to them in simple words, which they y reread over the years—things perhaps that one's ngue might stumble over when one attempts to speak em aloud. And, in this personal message, the physician n pass along his wisdom, the learnings from experience, guideposts, and his suggestions to lessen the hurdles the path of his widow and children. Perhaps his son is t sure whether he wants to be a physician. Schools ange in stature. The physician's alma mater may have pped by the time his son is ready. But the physician can ggest the name of a wise and true friend in his letter om his son might consult about this problem when it ises. To my mind, a sincere message from Dad is as portant as the lawyer's documents, however many ousands of tax dollars the latter might save.

One of the common faults of the American business professional man is that he sets up false goals in life. e works too hard for that intangible thing which we call uccess" or "security"—and primarily for the purpose giving his wife and children more money than is good r them. Sometimes the process of estate analysis re- lls these men to their original purposes in life and rees- blishes the true value between financial and spiritual lationships. Many men, after a self-analysis, begin to lax more; they take more frequent and extended vaca- ons; they learn to train and develop subordinates and embers of their family in the conduct of their business; ey pick up hobbies they had long since abandoned because of the pressure of other activities. They begin to plan for an active and satisfactory retirement, instead of the total cessation of all activity. One client sold his manufacturing business, which he had detested for 20 years, and purchased a small winter resort in Florida, where he will probably live many years longer. Conversely, one of my recent referrals is going to sell two hotels which he owns because "his wife can not take it easy with all that work to be done." People, as physicians know best of all, dig their own graves with their ambitions and nervous drives. The self-examination resulting in the process of estate analysis may be greatly beneficial. Almost without exception, the family of the client profits from his more relaxed attitude, making him a less tense and more enjoyable person to live with.

It is difficult for many men to realize what an insignificant gift money and property are, as compared to the love, companionship, and mental security they have to share when working under lower pressure. The man who does not sleep at night because of the problems on his mind is an unpleasant breakfast companion the following morning. The need for spiritual comfort and guidance is as great in our wives and children as their need for material things.

A few years ago, my daughter made a wish on a star. She asked, "Can I have anything in the world I want, Daddy?" I said, "Almost anything—what did you wish for?" She replied without a second's hesitation, "No more wars." Not money, not a pony—but peace! I felt pretty humble and ashamed of the mess we adults have made of our world, when a child's greatest wish is for no more wars.

Adults have those same tensions. A year ago Justice Robert Jackson was telling me how his hopes for a permanent peace, to grow out of the lessons learned from the trials of war criminals, were rapidly fading. Our wives and children have a vast mental insecurity caused partly by this problem of war, atomic bombs, and bacterial warfare. They have other tensions and conflicts raised by their relationships with other people, even by the mere problems of growing older. When the man of the family is dead, there is no one to share these problems, to smooth over their troubles, to give them strength and comfort. But if this man is so engrossed in his business or profession that it consumes his entire energies and time, then to his family what difference does it make if he is living or dead? He has abandoned their lives for a wholly separate one in which they have no place.

Omar Khayyam once well expressed it when he said, "The bird of time has but a little way to flutter and, lo, the bird is on the wing." The work of estate analysis is as much concerned with the art of successful living as it is with plans for death. The song which was so popular a year or so ago, "It's Later Than You Think," has a latent philosophy that some of us should not only recall to our clients and patients but to ourselves.

Perhaps the field of estate analysis might be summarized by saying that it is, first, basically a philosophy —a philosophy both for living and for death which works to solidify the relationships existing between a man and his family and to provide for the family's comfort after his death, but without destroying them as persons. Second, estate analysis involves a financial or investment problem of solving the questions of economic security with minimum hazard, bearing in mind both retirement and death and the usual errors made by professional men trying to realize such objectives too quickly. Third, it involves family security in guarding against the inexperience of widows or young people in investing funds realized from inheritance, when deprived of the wisdom of the deceased. Fourth, estate analysis involves the reduction of administratio penses, estate, inheritance, and income taxes to th est possible sums consistent with sound planning— may save many tens of thousands of dollars. Fifth, i quires sound administration provisions to anticipate solve problems which inevitably will arise and to re the hardships incident to one's family on one's deat

Doctor, what plans have you made?

COLOR TELEVISION AS A NEW MEDICAL-TEACHING AID

REPORT OF TWO AND ONE-HALF YEARS' EXPERIENCE

Kendall A. Elsom, M.D.
and
G. Frederick Roll, Philadelphia

Medicine was the first of the sciences to benefit from color television as a teaching aid. Its application in this field first took place in 1949 at the Annual Session of the American Medical Association in Atlantic City.[1] In the two and one-half years which have elapsed, 28 programs have been presented before medical audiences in this country and in Europe (Table). Over 200,000 physician isits have been made to these programs. The response of audiences to the medical color-television programs has left no doubt that this new medium can no longer be regarded merely as an interesting novelty but must be eriously appraised as a development in teaching which, though only partially explored, possesses far-reaching dvantages.

In an effort to assess the future of color television in medical education and to gain a more specific conception of its special uses, limitations, and ultimate possibilities, it seems wise to review the experiences of the first two and one-half years of its employment.

HISTORY OF USE

The use of black and white television in teaching medicine and surgery apparently was recognized as a possibility before World War II, but the first formal program in this medium was not presented until the winter of 1947, when at the Johns Hopkins Hospital five operations were transmitted by television to receivers in classrooms during a meeting of the Johns Hopkins Medical and Surgical Association.[2] Later in the winter of 1947 a television program was presented at the Cleveland Clinic in connection with a postgraduate course—this program having been an outgrowth of preliminary experiments with this method of teaching begun in institution as early as 1946.[3]

The next recorded use of television on a medical gram occurred in May, 1947, when a symposium cancer of the stomach was televised from the Creig Memorial St. Joseph's Hospital in Omaha to an adj hotel.[4] The American College of Surgeons included vision in the program of its Congress in New York in September, 1947, during which a variety of su procedures was transmitted from the New York Ho to the Waldorf-Astoria Hotel. At the 1948 Annua sion of the American Medical Association in Chi a television program was transmitted from the Pass Memorial Hospital under the sponsorship of the N western University Medical School and was receiv the Navy Pier and in several hotels in downtown cago.[5] In October, 1948, a program was transm from the Hospital of the University of Pennsylva nearby Convention Hall as a part of the annual m of the Medical Society of Pennsylvania. Later in television was again employed at the Annual Co of the American College of Surgeons held in Los A and at the Clinical Session of the American M Association in St. Louis.

It became obvious from these early monochrom vision programs that in order for this medium to a its fullest usefulness as a teaching aid color was a sary addition. Various methods for introducing were then in the developmental stage in the tele industry. Consequently, in the fall of 1948 Smith, and French Laboratories discussed with the Res and Engineering Laboratories of the Columbia B casting System the possibility of manufacturing television equipment adapted for hospital use. As sult, a color-television camera and camera chain especially built by the Research and Engineering oratories of the Columbia Broadcasting System color receivers were built according to Columbia B casting System specifications by the Zenith Radio C ration in cooperation with the Webster-Chicago C ration. This equipment, owned by Smith, Klin French Laboratories, has been used in all of the

elevision programs subsequently sponsored by them. In reparation for the initial program, the equipment was iven two weeks of preliminary testing in the Hospital of he University of Pennsylvania in May of 1949 and then nstalled in the Atlantic City Hospital and Convention Iall, where it was first used at the 1949 Annual Session f the American Medical Association. The reaction of ne large audience at that meeting indicated that, rather nan being a mere novelty, color television possessed reat potentialities as an educational medium. As a result, it was included on the programs of a number of nedical meetings throughout the country.

EQUIPMENT AND PERSONNEL

The equipment used employs the field sequential type f color television authorized by the Federal Communiations Commission for commercial color-television roadcasts. It consists of a single camera, control nd audio-equipment, and 20 color-television receivers. 'he camera was made spark-proof in order to insure afety in operating rooms. A built-in dolly enables the amera to be moved easily, and by virtue of its position n a 6-ft. boom it can be placed in any desired position n relation to the subject being televised. The receivers mploy a 10-in. tube with a magnifying lens capable of roducing a picture approximately 12 by 14 in. in size. Vith a picture of this size as many as 50 persons can be ccommodated at each receiver. The transmission of the rograms in almost all cases has been over a closed circuit by microwave radio relay.[6] If tall buildings or ther obstructions exist between the transmitting and eceiving points, the signals are redirected from some ntermediate point. Where the distance between the transmitting and receiving sites has been less than ¼ mile, transmission has been accomplished through a coaxial cable. At the 1949 Clinical Session of the American Medical Association, held in Washington, D. C., the color-television program was transmitted from Johns Hopkins Hospital in Baltimore—a distance of some 40 miles. To insure quality of reception at this distance, the signals were amplified at a point halfway between the two cities.

Ordinary operating-room lights are adequate for televising surgical operations, although it is occasionally advantageous to supplement the overhead lighting with one or two portable spotlights. When medical clinics are televised in color, two portable banks of fluorescent lights provide diffuse lighting.

Three technicians are needed at the transmitting site —one man each at the camera, control panel, and audio-equipment. If 20 receivers are used, three technicians are required at the receiving point—two men to adjust the receivers and one man to monitor the signal as it is received. In addition, a physician having familiarity with television techniques as well as an understanding of the subject matter of the presentation is necessary, not only in the initial planning of the program but in directing the cameraman and in coordinating the program while it is on the air. Working with the physician coordinator is a floor manager, whose duties include the preliminary instruction of the speakers, the moving of "props," adjustment of lights, arrangement of microphones, and so forth.

Color-Television Programs that Have Been Presented Before Medical Audiences

Date	Location	Medical Society	Hospital
1949:			
June 6-9	Atlantic City	American Medical Association	Atlantic City Hospital
Sept. 21-23	Denver	Colorado State Medical Society	Denver General Hospital
Oct. 17-21	Chicago	American College of Surgeons	St. Luke's Hospital
Oct. 29	New York	American Cancer Society	Memorial Hospital
Dec. 6-9	Washington, D. C.	American Medical Association	Johns Hopkins Hospital
1950:			
Feb. 6-8	Atlanta	Atlanta Graduate Medical Assembly	Grady Memorial Hospital

[6] All programs have been transmitted over facilities installed by the Bell Telephone Company.

TECHNIQUE OF COLOR TELEVISION PRESENTATIONS

It is our belief that color television will assume an increasingly important role in medical teaching in the years to come. For this reason it seems important to call attention to some of the special techniques in teaching which are required in the use of this new medium, since some respects they differ radically from the traditional ɔds now in use. Capt. David Hawkins, Director of Audiovisual Training for the Third Naval District, speaking of naval training by means of television stated the problem succinctly when he said recently,[7]

Fig. 1.—An improvised "television studio" in an operating room of the Johns Hopkins Hospital. During the 1949 Clinical Session of the American Medical Association, the first intercity color broadcast occurred between Baltimore and Washington, D. C. For nonsurgical presentations two banks of fluorescent lights provide diffuse lighting of the area occupied by the speaker, patients, and other things. The color camera is seen in the center of the picture. The speaker is provided with a collar-type microphone.

> The great difficulties in teaching by television are finding the right instructor for television and adapting the lesson to the medium to take full advantage of its possibilities. All actors are not instructors and all instructors are decidedly not actors. The ideal would be an instructor thoroughly familiar with his subject and thoroughly at home before the microphone and camera.

Surgical Clinics.—In the teaching of operative surgery by means of color television, very little modification of present practices is required. Our experience in this regard has revealed a few points worthy of mention. Most surgeons apparently miscalculate the size of the surgical field visible to the television audience. This is usually so small that only the actual site of operation can be observed. The spectators cannot at once visualize the position of the patient or the actual location of the operative site. It is important, therefore, for the surgeon to demonstrate any landmarks, and to indicate whether the camera is placed at the head, foot, or to the side of the patient. This orientation of the audience avoids much confusion. The surgeon who is accustomed to operating before an audience seated in an amphitheater has developed the habit of pitching his voice to be heard by the audience and lowering it to make remarks to be heard only by the operative team. On television this habit can cause him some embarrassment until he learns the small microphone placed between the layers o mask picks up the slightest sound. Whispered comm give an impression of nervousness or irascibility o part of the surgeon which is not conveyed if he s in his usual voice. Actually, one of the great attrac of television to his surgical confreres in the audien the unrehearsed, unedited informality with whicl surgeon meets the vicissitudes of the moment.

Many surgical presentations are slightly marred b inadequate demonstration of pathological specime moved at operation. These are frequently demons at some distance from the site of operation, whe lighting is poor and the focus of the camera m changed in such haste that the spectators do not a satisfactory view. If a towel is placed over the in and the specimen examined very deliberately w *moving it unduly, a good view* is usually assured. the television camera is placed 2 or 3 ft. above t of operation, it is inevitable that the surgeon or his ants occasionally obscure the view for short p When this occurs, an intercommunication system p the monitor to inform the surgeon, who soon devel awareness of the position of the camera, which obviates the difficulty.

Most surgeons with teaching experience give v fective presentations without radical alteration i habitual methods of operating-room teaching. A r commentary by the surgeon should keep the au constantly oriented as to the details of the op technique which are being observed at a given m This commentary need not be continuous, provi audience is kept informed as to the purpose an nique of some future steps which may absorb the attention of the surgeon. If at some stage in the op

Fig. 2.—A view of the operating room during a color-television The camera is seen in the upper right-hand portion of the pictu approximately 1½ ft. above the heads of the operative team and interfere with their movements.

time must be devoted to an obvious step, such as off many hemostats, an opportunity is presented discussion of unrelated subjects such as the history, ical findings, indications for operation, mortalit tistics, postoperative care, and the like. Use of thi avoids such commentary at a time when the au uld prefer to concentrate on watching the technical cedures then being performed.

---

[7] The New York Times, Feb. 18, 1951.

When a program of operative clinics is planned, it , in general, been found desirable to limit the tele- on presentation to those procedures which are essen- from the teaching standpoint and to eliminate such tine steps as the opening and closure of the wound. the average three-hour program it is usually possible chedule five major operative procedures. This usually essitates the use of two and occasionally three adja- t operating rooms, so that at the end of one procedure er the camera can be moved immediately to the next ient, in whom the preliminary steps of the operation e already been carried out, or the patient, prepared in of the adjacent operating rooms, can be moved under camera.

edical Clinics.—The effective presentation of a lical clinic requires techniques which are unfamiliar nost teachers. The selection of material which is well pted to the medium in use is of the utmost importance. far as possible, material which lends itself to pictorial sentation should be selected, since it is only here that r television contributes to the effectiveness of its sentation. A didactic lecture utilizes none of the uliar advantages of television and not only gains noth- but suffers the serious defect of seeming to place speaker abnormally close to the audience, who soon l this somewhat distracting. Our experience has amply onstrated that the television audience does not feel nd by any sense of courtesy to the speaker and will n depart if the picture on the screen is not interesting. ics proving of great interest because of their pic- al value have dealt with such subjects as the admin- ation of shock therapy, biopsy methods, cardiac eterization, the handling of radioactive isotopes, the onstration of dermatological lesions, fresh autopsy erial, and the like. Presentations built around demon- tions with patients are almost uniformly successful, ether they show, for example, the classical facies in locrinological disease or depend on interviews in ich interesting histories are elicited or the patient's ctions to certain forms of treatment, and so forth, are cussed. A number of clinics which have been par- larly successful come to mind, a few of which may mentioned at random: the development of methods speech following laryngectomy, the results of cortico- pin (ACTH) or cortisone treatment in cases of rheu- toid arthritis, the results of ileostomy in cases of erative colitis, the care of a colostomy patient, the stoperative results in operations for congenital heart ease, and so forth. All are subjects in which participa- n of the patients has added to the interest of the clinic.

While the use of color transparencies, lantern slides, rts, and x-rays all have a place, a presentation which nsists solely of them fails to utilize to the fullest the erent advantages of the medium of color television d fails to sustain the interest of the audience. Many eakers make the error of assuming that the usual lan- n slides, charts, graphs, and so forth can be used either m the platform or before a color-television camera. is assumption does not take into account the important fference that visual material is ordinarily enlarged by ojection to a screen but is reduced on the television receiver. The lettering, legends, and so forth on lantern slides and charts are, therefore, frequently illegible on the television screen. Charts are frequently too complex to be grasped quickly by the audience, and the method of colors to differentiate data is rarely utilized. Charts for use in television should be as simple as possible, approximately 2 by 3 ft. in size, and with heavy block lettering which should be at least 1½ in. high. Color should be used wherever it is appropriate. It has proved effective to use a blackboard and to construct a diagram or chart step by step rather than to show a previously prepared chart. This introduces the data to the audience one item at a time, which minimizes confusion, and, more important, is likely to discourage the speaker from attempting to construct a too complicated chart or diagram.

It has been interesting to observe that many of the mannerisms of speakers are accentuated before a television camera. Many clinic presentations are marred by the tendency of the speaker to sway from side to side, to walk about while speaking, or to move forward and backward. All of these present problems for the camera operator and give a disconcerting impression to the audience, since the close-up position of the camera not only exaggerates the movements of the speaker but causes him to get in and out of focus. With a little practice these defects are easy to correct; the speaker can train himself to stand quietly and look into the camera lens, rather than seem to avoid his audience.

Fig. 3.—A view of the color-television demonstration for the Annual Session of the American Medical Association in San Francisco, June, 1950. More than 12,000 physician visits were recorded during the four-day color-television program, which was transmitted from Ft. Miley Veterans Administration Hospital to the Masonic Temple.

AUDIENCE EVALUATION OF MEDICAL COLOR TELEVISION

After the annual session of the Missouri State Medical Association in St. Louis, March, 1950, a survey of the attending physicians was conducted to determine their opinion of the effectiveness of color television in postgraduate teaching of surgery. Of 116 physicians who answered the questionnaire, 91% preferred to watch surgery on color television rather than from an operating-room amphitheater, and 52% preferred to observe an operation on color television rather than from a place beside the operating table. The further effectiveness of color television in medical teaching was attested to by a survey conducted the following month during the annual session of the American College of Physicians in Boston, April, 1950. This survey, although not recorded statistically, indicated that the great majority of fellows desired an expansion of the television portion of coming programs.[8]

[8] Loveland, E. R.: Personal communication to the author.

In November, 1950, a two-day postgraduate seminar, presented by the Wayne University College of Medicine and the staff of the Grace Hospital in Detroit, was given entirely by means of color television. The audience was made up largely of general practitioners. After this seminar Wayne University College of Medicine sent out 500 questionnaires, of which approximately 350 were returned.[9] The findings were that (1) 96% expressed a preference for watching surgery by means of color television, as compared with viewing it from an amphitheater; (2) 85% expressed a preference for a clinical presentation on color television, as compared with the conventional paper read from the platform; (3) 42% of this audience considered diagnosis the subject matter of greatest interest, 38% treatment, and 20% the new advances in research.

FUTURE OF COLOR TELEVISION

The use of color television in medicine has been limited thus far to postgraduate teaching before large audiences at medical meetings. It has not yet been possible to determine its place in routine undergraduate teaching. Greatly simplified equipment is now being manufactured,[10] which will reduce the initial and upkeep costs and the personnel requirements for the use of color television in medical schools. Future experience alone will indicate its proper place in intramural teaching. Certainly in surgery and dermatology its advantages have been amply demonstrated. While the growing tendency to teach in small groups reduces the necessity for television, any lectures, clinics, and demonstrations are still given large audiences which could be more effectively pre-nted by television. In the field of postgraduate teaching apart from formal meetings, color television presents its most challenging possibilities. With the recent nationwide extension of microwave radio relay towers, it is now possible for a medical program to be transmitted over a closed circuit, from New York City, for example, and be received simultaneously by physicians gathered in groups in various cities across the country. In addition, if the Federal Communications Commission were to allocate broadcast channels for educational purposes, one can visualize regularly scheduled programs from medical centers reaching the physician in his home or office on a practical basis. Since it would be undesirable for these programs to be available to the laity, a "scrambling" mechanism, such as that devised by the Zenith Radio Corporation for use in so-called "Phonevision," could be utilized. Such a device so distorts both image and voice that they are unintelligible unless they are "unscrambled" in the receiving set. By making available the device for "unscrambling" only to those accredited by their local medical societies, for example, control over the broadcast could be maintained.

SUMMARY

Since its introduction into medical teaching by Smith, Kline and French Laboratories, color television has been employed in 28 medical meetings in the past two and one-half years. Over 200,000 physician visits to these programs have been recorded. Color television is no longer a novelty which in itself attracts attention but can now be judged on its merits as a new medium for medical teaching. The response of physicians who have ob
color television leaves no doubt that the mediu
effective teaching aid, the potentialities of whic
only begun to be explored. The use of this mediu
require the development of new techniques whi
serve the attention of teachers of medicine. The v
color television in teaching large groups at medica
ings has been amply demonstrated. The adapta
the method to informal undergraduate teaching
needed. To provide color television to the physi
his home or office for purposes of postgraduate t
is a problem for the future.

CLINICAL NO

THIOCYANATE PSYCHOSIS

H. J. M. Barnett, M.D.
M. V. Jackson, M.D.
and
W. B. Spaulding, M.D., Toronto, Canada

This is a presentation of seven cases of thi
psychosis, two of which were fatal, one havi
studied at autopsy. An additional case of combi
mide and thiocyanate intoxication is described. T
ature has been reviewed with regard to the to
thiocyanate in the treatment of hypertension; in
lar, reports of fatal cases have been examined.

During the last half-century medical observ
argued for and against the use of thiocyanate.
perusal of the voluminous literature that has
lated only two things seem firmly established: 1.
tiveness, either as a symptomatic remedy or a
useful in reducing blood pressure, is by no me
erally accepted. 2. Toxic manifestations are r
common.

Having fallen into disrepute about 25 years a
cyanate came into favor again in 1936 when
described a rapid and easy chemical method of f
the blood level accurately. He maintained that
able side-effects were infrequent with careful f
blood studies. However, because of the inconven
recording repeated blood levels and the disagree
garding its usefulness, thiocyanate has remained
tively minor tool. A more extensive trial can be
again because of recent favorable comments by

tension, J. A. M. A. 106: 762 (March 7) 1936.

in,[2] British,[3] Australian,[4] and Canadian [5] writers. How-ver, despite the fact that these authors invariably stress e necessity for close observation of patients being eated with thiocyanate, our experience indicates that e warnings may go unheard or unheeded partly because me current commercial advertising may fail to mention ell-recognized contraindications to therapy and may ake misleading statements regarding the potential toxity of thiocyanate.

CLINICAL USE OF THIOCYANATE

Although authorities have outlined careful programs at include dosage, clinical observation of patients, and equent measurement of serum levels, it is necessary to nphasize that none of the patients discussed here had en adequately followed by their physicians in all these spects. None had had serum levels estimated; at least e had been given an excessively large dose; and others, cause of mental confusion, might have taken more than is prescribed. Ayman,[6] Hines,[2] and Connell and associes [5] have recently summarized what they regard as the dications for the use of thiocyanate and their program r its administration. An average recommended dose Ayman) is 3 grains (0.20 gm.) three times daily for ree days, then twice daily for four days, the maintence dose to be determined by the serum level at this ge. The daily dose required to maintain a satisfactory vel varies from one person to another, and therefore estimation requires careful study of the patient. The aintenance dose would average between 3 and 6 grains).20 and 0.40 gm.) daily. Serum levels should be meased at least fortnightly, the aim being a range of 8 to 10 g. of thiocyanate per 100 cc. of serum, but levels up to 2 mg. are permissible. These serum levels are said to ve optimum effect with minimum toxicity.

THIOCYANATE TOXICITY

Apart from varying individual reactions to given doses the drug, certain other factors should be kept in mind. here is evidence that patients who are light in weight quire less of the drug than heavier patients.[5] The presice of renal disease affects excretion, causing the drug) reach dangerous levels rapidly. The drug diffuses itself rough all intercellular fluids, and if cardiac or renal lema is present the drug may be stored in large quantity ven though the blood level is deceptively low. A sudden iuresis would then raise the concentration of the drug dangerous levels. It should never be used, therefore, r patients with heart failure and should never be given efore a good clinical assessment of renal function has een made. It has furthermore been claimed—and the remise for the claim is reasonable—that a history of revious brain damage or evidence of existing abnornality in cerebral function should lead to very cautious se of the drug, if not to its complete exclusion. Despite ll these precautions, there are a number of persons in vhom toxic symptoms may appear at therapeutic levels; ve and others have encountered even the serious psyhotic complications at or near "therapeutic levels."[7]

Toxic manifestations are to be found in nearly all organ systems. Kessler and Hines [7] believe that they can divide the adverse symptoms into two general groups: 1) those that occur within the therapeutic range, and (2) those that are due to excess accumulation of the drug. In the former group, depressed bone marrow function and hypothyroidism are the most serious; fatigue, anorexia, and nausea the commonest. In the latter group, varying degrees of depressed cerebral functions are the major complications. Skin reactions varying from maculopapular eruptions to purpura and exfoliative dermatitis occur in both groups. Thrombophlebitis and coronary and cerebral thrombosis, cited as complications of the therapy, are more difficult to distinguish from the natural sequelae and complications of the underlying vascular disease. An interesting symptom is a peculiar aching of the legs and body attributed to osteoporosis.[2] The mode of production of most of these toxic complications is totally unknown, just as is the mode of therapeutic action of the drug.

The fatal cases reported in the literature were collected by del Solar and associates [8] in 1945. In several instances death followed the taking of thiocyanate for suicidal purposes, but seven patients died of the toxic effect of the drug while it was being given as therapy. Ayman [6] has pointed out that five of these had advanced impairment of renal function prior to therapy and that data in the other cases were inadequate in this regard. In the fatal case added by del Solar and associates, there was pathological evidence of chronic renal damage upon which a necrotic nephrosis was superimposed. In reviewing their management of the patient, we noted that restlessness was controlled with bromide. This drug is known to produce a toxic psychosis, which in our experience is indistinguishable from thiocyanate psychosis; therefore, bromide should be avoided in the management of the latter. One further fatal case has been reported, by Kessler and Hines. The patient, at death, was distinctly icteric and affected with a generalized exfoliative dermatitis. Postmortem examination disclosed extensive centrolobular necrosis of the liver, arteriolar nephrosclerosis, and cerebral edema. In all the fatal cases the toxic symptoms appeared after short periods of administration of the drug. Furthermore, in several of the cases reported there was an abrupt rise in the serum concentration from a "safe" to a dangerous level coincident with the onset of symptoms of toxicity. This phenomenon is not predictable by diligent observation of serum levels. However, it may be that more careful selection of patients for treatment with thiocyanate, excluding those with severe cardiac, renal, or cerebral damage, would reduce the likelihood of rapid, treacherous increases in thiocyanate retention.

SOURCE OF MATERIAL

In the cases reported here, the patients were all presented as diagnostic problems in either the Toronto Psychiatric Hospital or the Toronto General Hospital, with a confusional psychosis as the outstanding feature. In every instance thiocyanate had been given in sporadic, casual, and uncontrolled fashion.

REPORT OF CASES

CASE 1.—E. C., aged 63, was admitted to the Toronto Psychiatric Hospital on May 11, 1941, because she refused food and drink, believing them poisoned. Relatives described her as a difficult person, habitually tyrannical and cruel but becoming more eccentric and suspicious as she grew older. About four months before admission her memory had become poor; she misidentified people, tended to live in the past, and became untidy. Her physician reported that she had been instructed to take 2½ grains (0.15 gm.) of sodium thiocyanate three times daily for a four-day period and to repeat this routine at intervals of a week to ten days for three months. There were no complaints referable to cardiovascular disease volunteered by the patient. Three days before admission she could not walk without staggering. The next day confusion was marked, and delusional thinking governed her behavior. The family described urinary incontinence, inability to swallow, and dribbling of fluids down the side of her face. She was sleepless and muttered to herself constantly.

On admission she was confused and disorientated, with slurred speech, rambling conversation, and urinary incontinence. Fluids dribbled from her mouth. The blood pressure was 200/106 mm. Hg, but the heart was clinically normal. The retinal vessels were tortuous and narrowed. There was slight lower left facial weakness. The serum cyanate level was 16 mg. per 100 cc.; serum bromide level, normal. During hospitalization the highest recorded urinary specific gravity was 1.011, but in a two-hour test it ranged from 1.002 to 1.005. The blood pressure varied from 0/106 to 162/80.

She was difficult to nurse because of the intensity of her auditory hallucinations and delusions of persecution. The neurological signs disappeared within 48 hours of admission but it was not until the serum cyanate had reached a level of 2 mg. (June 6) that the delirium subsided. A residual memory defect of a mild character persisted at the time of her discharge on July 5.

A follow-up examination a year later revealed she was frequently confused, very forgetful, and had night frequency, which confirmed the progression of cerebral and kidney damage. She died on Feb. 11, 1945.

The patient showed evidence, both before and after her delirium had subsided, of cerebral arteriosclerosis. She did not come out of her psychosis until her serum cyanate level was down to 2 mg. Because of her failing memory she probably had not followed her physician's instructions regarding her medication. Unfortunately, the only indication for the thiocyanate treatment had been the symptomless hypertension. During the most toxic period she presented transitory focal and neurological signs.

CASE 2.—M. M., aged 50, was admitted to the Toronto Psychiatric Hospital on Dec. 18, 1941, in a wildly delirious state. She was a widow, stable, with few interests outside of her factory work. On Nov. 19, 1941, she had had an attack of vertigo followed by vomiting, and examination the next day had revealed a hypertension of 220/105. Sodium thiocyanate (2½ grains [0.15 gm.] three times daily for five days) was prescribed, and then the administration was reduced to twice daily. On Nov. 28 the blood pressure was 160/98, and by Dec. 3, she became confused and irritable, misidentified sounds and people, and thought that animals were crawling over her body. Cyanate medication was discontinued Dec. 11, but her symptoms worsened until admission to the hospital.

She arrived in a very disturbed mental state. The pressure was 154/80 on admission and ranged between 1 and 126/62 during hospitalization. The heart was apart from electrocardiogram evidence of left ventricu ponderance. The specific gravity of the urine ranged 1.004 to 1.030. The nonprotein nitrogen level was 2 and the serum cyanate level, 24 mg. per 100 cc. No b was present. On Dec. 24 the serum cyanate level was 1 per 100 cc. and cerebrospinal fluid cyanate level, 1.4 mg. p cc. Fluids were forced, but the delirium did not subsi the serum cyanate level had been reduced to 5 mg. The p remained in the hospital until Jan. 24, 1942, when a slight r ual memory defect was noted.

On follow-up examination, Nov. 8, 1944, this memory d was still present but not marked; there had been a gradual ening of initiative and interest, but there were no sym referable to hypertension.

The patient died on April 29, 1946, after having suffered eral "strokes." No autopsy was performed.

A 50-year-old woman was given thiocyanate in st ard dosages to reduce blood pressure after an atta vertigo. She became delirious within 13 days o *beginning of the therapy*, and the delirium increas severity for a week after treatment with the drug stopped. On recovery there was a mild memory d which had not been noted before thiocyanate was *scribed. She had been employable prior to* her taki this medicine.

CASE 3.—E. T., a 65-year-old woman, was admitted Toronto General Hospital on Aug. 10, 1942, because of plained deepening stupor.

For more than five years she had been known to be tensive but free of symptoms related to cardiovascular d On July 29, 1942, she had experienced dizziness with a headache. The next day she felt worse and consulted a phy who, finding her blood pressure elevated, prescribed grains (0.40 to 0.6 gm.) of sodium thiocyanate every three The medication was maintained for the 12 days prior to sion. Symptoms had remitted until Aug. 7, when she weak, dizzy, and tremulous. During the next three da mental state was one of increasing retardation with slow, incoherent speech and deepening stupor.

The admission examination revealed a semicomatose w who screamed in protest against attempts to turn her i There was a blood pressure of 178/80 and moderate enlargement. The serum cyanate level taken on the fourt pital day was 36 mg. per 100 cc.; the patient's mental sta reverted to normalcy except for slight drowsiness.

The serum contained concentrations of 36, 20, 15, and 8 mg. per 100 cc. on the 4th, 8th, 10th, 12th, 16t 17th days, *respectively*. Urinary levels were 24, 19, 6, mg. per 100 cc. on the 9th, 12th, 13th and 16th days, tively. A Mosenthal test showed a specific gravity of from to 1.024. The serum contained no bromide on the fourt Serial blood pressures varied between 180/90 and 152/70

The patient was discharged from the hospital on A 1942, free of symptoms.

This patient was given an excessive dose of thi nate, and an increase in the severity of her sympto weakness and *dizziness developed*. Such complaints been stressed by some authorities as due to hyperte but it should be noted that drug intoxication prod similar picture before delirium results.

The diagnosis was *not made for four days*, be no drug intake was suspected. Cyanate delirium s be considered whenever mental symptoms are dev ing in a hypertensive patient.

CASE 4.—E. C., aged 60, was admitted to the *Toronto* P atric Hospital on Dec. 29, 1942, because he was wildly dis at home, had tried to choke his daughter, and had attemp w furniture out the window. He was a rather quick-tempered, orn, overly conscientious man, who had no close friends obbies; but his family had found him pleasant. After a k spell" he had been examined in a medical clinic on July 1942. The blood pressure was found to be 240/140, and was a gallop rhythm with no sign of heart failure. A diag- of hypertensive heart disease was made.

om July until early December he was well and working; he became more fatigued and increasingly short of breath. ng the few days before admission his family noted restless- periodic confusion, and forgetfulness. The morning ding admission he claimed he could hear strange people ng in the house, and later he suddenly became very disturbed iolent.

admission, he was unconscious, having been heavily ed. The blood pressure was 200/98-80, and the heart was ged. Because of hypertension and a history of delirium the n cyanate level was checked and found to be 30 mg. per cc. Other laboratory findings were nonprotein nitrogen 82 mg. per 100 cc.; blood sugar, 160 mg. per 100 cc., and rospinal fluid, normal.

s physician was contacted, and he reported that in mid- mber the patient's blood pressure had been 250/140. Five s (0.30 gm.) of sodium thiocyanate, three times daily, had prescribed and had been taken for 8 to 10 days before his ng to the hospital.

ring the first hospital day the patient roused somewhat. his condition worsened, and his temperature rose to 104 F. ied rather suddenly, less than 48 hours after admission. His refused autopsy.

his patient was given only 15 grains (1 gm.) of m thiocyanate daily for 8 to 10 days, but a highly serum level of 30 mg. per 100 cc. was found on ission. The violent behavior illustrates the severity e mental reaction that may result from the use of drug. The patient's illness presented a diagnostic lem because initially no history of thiocyanate medi- n was elicited. Nonetheless, the nature of the psy- is was suspected because of the combination of an e delirium and hypertension. Examination of the m confirmed the diagnosis before further information obtained from the family physician. The sudden h with preceding pyrexia was compatible with brain congestion and edema as described in other patients hom autopsies have been performed.

SE 5.—A. C., aged 55, was admitted to the Toronto Psychi- Hospital on Feb. 10, 1943, because she was extremely hensive and suspicious, and heard voices and sounds that ied her.[9]

e had been a happy, stable person. Two years before admis- she had consulted a physician because of general fatigue. ood pressure of 235/135 had been discovered. In January, , she was dizzy and again consulted a physician, who found od pressure of 250/140. He prescribed 5 grains of sodium yanate three times a day and at bedtime, beginning Jan. 29. eb. 8 she had become confused and tearful, and was unable nunciate her words clearly. Her blood pressure was then 115. Cyanate therapy was discontinued, but her mental state me worse. Her conversation was jumbled; she shouted out thought she was being poisoned. She said that she saw ls and accused her nurse of filling her with electricity.

n examination she was dehydrated; the blood pressure was 88, and the heart was clinically normal. Urinalysis showed urine contained albumin 2+, there were no casts, and the ific gravity was 1.024. Because of the delirium, the cyanate, nide, and nonprotein nitrogen blood levels were checked found to be 20 mg. per 100 cc., 0, and 73 mg. per 100 respectively. The serum cyanate level gradually fell to 12 by Feb. 22 and to 2 mg. by March 3. The nonprotein nitrogen l returned to normal by Feb. 22.

he patient continued to be very noisy and restless until nite improvement began on the eighth day. By the 18th day was mentally clear, and the serum cyanate level was 5 mg. per 100 cc. The blood pressure varied between 140/85 and 196/112-104, but during the week before discharge (March 6, 1943) it was 180-190/100-120.

Since the patient left the hospital, her niece reports that she has remained well physically and mentally, is contented and alert, travels alone, has not sought employment, but assists with the housework. In a letter to her niece dated February, 1950, the patient reported that her blood pressure had risen to 230.

After 10 days of standard thiocyanate therapy serious mental symptoms arose. The clinical state deteriorated after cessation of medication. The symptoms for which she had been given cyanate were trivial, and by 1950 she had carried on without therapy for seven years. It would seem unsound to administer a potentially dangerous drug to a patient such as this, whose hypertension continued uneventfully for seven years.

Case 6.—J. J. L., aged 69 years, was admitted to the Toronto Psychiatric Hospital on June 4, 1944, because he was confused, thought people were chasing him, and screamed for police protection.

On recheck examination for a chronic asthmatic condition on May 17, 1944, the patient's physician had found a blood pressure reading of 234/110 and had prescribed 2½ grains of sodium thiocyanate twice daily. By the seventh day of treatment the patient was very talkative and confused, from which time the intensity of his delirium increased.

On admission he was confused, resistive, and noisy. Examination disclosed dehydration, scattered rhonchi in his chest, a blood pressure of 140/80, and a clinically normal heart. The serum cyanate level was 32 mg. per 100 cc.; nonprotein nitrogen level, 61 mg. per 100 cc.; bromide level, normal. Urinalysis showed albumin 2+ with specific gravities of 1.014 to 1.019.

The patient was given intravenous fluids and tube feedings but continued to be a very difficult nursing problem. The serum cyanate level was 25 mg. per 100 cc. on the fifth hospital day. The next day he suddenly became cyanosed, and death occurred rapidly.

Autopsy[10] revealed arteriosclerosis of the large and small arteries throughout the body, with the characteristic arteriolar changes of benign hypertension. The kidneys were shrunken, scarred, and pitted, and weighed only 60 and 75 gm., respectively. The heart was not enlarged, weighing 370 gm. There was slight hypertrophy of the wall of the left ventricle (1.8 cm.). Distinct emphysema was present with bullous formation.

The brain weighed 1,410 gm. and exhibited frontal gyral atrophy but was moderately edematous. The superior cerebral veins were congested. The pons and medulla were severely congested and edematous, so that the former bulged well forward and was soft even after fixation. Microscopically there was evidence of severe arteriolar sclerosis throughout all parts of the brain. The gross appearance of medullary and pontine edema and petechial hemorrhages was confirmed. Some of the latter were in the floor of the fourth ventricle and the lateral walls of the third ventricle.

This patient's psychosis was evident by the seventh treatment day, and he was dead approximately two weeks later. Distinct brain-stem edema and nephrosclerosis were the chief autopsy findings. The case demonstrates the danger of thiocyanate therapy without adequate assessment of renal function. Elderly hypertensives are more liable to have significant renal damage and accordingly should be examined carefully.

Case 7.—M. K., aged 50 years, was admitted to the Toronto General Hospital on Dec. 6, 1949, in a greatly confused mental state.

---

[9] This case of thiocyanate damage was reported by Dewan, J. G., and Owen, T.: Mental Illness and Principles of Medicine, Canad. M. A. J. 52: 349 (April) 1945.

[10] Prof. E. A. Linell, of the Department of Neuropathology, Banting Institute, University of T[illegible] allowed us to use the autopsy report of this case.

Two and one-half years previously she had suddenly suffered right-sided paralysis with aphasia and disorientation. For five weeks catheterization had been necessary. Recovery had been gradual, the only residuum being a feeling of strangeness in the right side of the body.

Five weeks prior to admission she had consulted a physician, who, finding a blood pressure of 240/120, had prescribed sodium thiocyanate. This drug was taken in doses totaling 7½ grains (0.50 gm.) daily from Nov. 7 to Nov. 14, then 10 grains (0.60 gm.) daily until Nov. 24, and finally 7½ grains daily until the patient entered the hospital 12 days later.

About two weeks before admission her movements became incoordinated and her speech, slurred. She was disoriented, and confused, and had urinary retention.

Admission examination showed a bewildered woman, hallucinated in the auditory field. Her mood was labile, changing quickly from laughter to tears. She was dysarthric and had difficulty carrying out simple commands. The retinal arterioles were narrowed. The blood pressure was 160/90 and the heart enlarged, with a loud precordial systolic murmur. Brisk tendon reflexes in the right leg with a positive Babinski reflex were interpreted as residual from the previous hemiplegia. On the second hospital day the serum cyanate level was 39 mg. per 100 cc. No bromide was present in the blood serum.

After the first week, improvement occurred to the point where she was aware that she was in the hospital but was confused as to time. On the 10th day her mental state had returned to normal. Inability to urinate persisted until the fourth week, at which time, despite the finding of an atonic bladder on cystometrography, she could urinate well enough that the residual urine measured only 10 cc. Serial serum cyanate levels were 39, 29.5, 28, 17.5, 16, 14, 10, 6, 4, and 1.5 mg. per 100 cc. on the 2nd, 3rd, 4th, 5th, 6th, 11th, 14th, 15th, 17th, and 21st hospital day, respectively. The cerebrospinal fluid contained 14 mg. per 100 cc. of cyanate on the second day, and a trace on the 22nd day. Serial blood pressures ranged between 140/105 and 130/70.

She was discharged from the hospital on Jan. 9, 1950. Follow-up examinations in the outpatient department have revealed an alert, happy woman, able to do her own housework and having a symptomless hypertension.

A woman with definite evidence of residual hemiplegia was given thiocyanate for four weeks, and a state of delirium developed after two weeks of therapy. The serum cyanate level on admission to the hospital was 39 mg. per 100 cc., and the cerebrospinal fluid level, 14 mg. er 100 cc. The drug was prescribed on the basis of a ingle blood pressure reading. During the development of toxic symptoms thiocyanate may be continued by a physician who mistakes an onsetting psychosis for manifestations of hypertensive encephalopathy.

Case 8.—N. B., aged 59 years, was admitted to the Toronto Psychiatric Hospital on March 27, 1940, because she was confused, excited, and visually hallucinated. An asymptomatic hypertension (210/120 to 170/100) had been detected in the course of a routine physical examination in January, 1935. In January, 1940, she showed increased anxiety about money and dislike of living with her children. Because of insomnia and crying spells, a physician prescribed a bromide mixture. (No doctor admitted prescribing cyanates.) At first the bromide promoted natural sleep, but during the three weeks before admission she became increasingly drowsy. Two weeks before coming to the hospital she staggered, muddled her speech, cried frequently, and thought she would die. Three days before admission she was much worse: fearful, noisy, restless, and claiming she saw men with scissors who were trying to cut her into pieces. She heard the rushing of waters and thought they would all drown.

On admission she was ataxic, confused, stuporous, and unable to feed herself. She then became more noisy, restless, and vividly hallucinated as the stupor lifted. Her blood pressure was 165/100; serum bromide level, 290 mg. per 100 cc.; serum cyanate level, 15 mg. per 100 cc.; nonprotein nitrogen concentration, 35 mg. per 100 cc. Urine concentrated to a specific gravity of 1.035.

On the fourth hospital day the patient was menta
The serum bromide level was then 120 mg. per 100 cc.;
cyanate level, zero.

The patient was discharged one month after admis
continued to have a persistent asymptomatic hyperten

she stated that she was "better than for many years."
on July 3, 1949, from cardiac insufficiency which had p
during the three months before death. Autopsy was
formed.

This is an example of a combined bromide and
delirium. The subsequent course revealed that
years she remained free from any symptoms ref
cardiovascular disease. Thiocyanate had been
is frequently the case, for symptoms of anxiety
attributed to hypertension.

COMMENT

Several difficulties that hinder the prompt re
of thiocyanate psychosis deserve emphasis. Clin
toxic delirium varies from mildly stuporous, co
states to delusional, hallucinatory, or maniacal
The psychosis resembles and indeed, as ind

ERCAPTOMERIN SENSITIVITY

PORT OF A CASE

ster Weissman, M.D., Jersey City, N. J.,
d
. Harold Gelfand, M.D., New York

Effective employment of mercurial diuretics in the anagement of cardiac decompensation is now well cognized. With the widespread use of these drugs, reac- ons have been noted ranging from local irritation at the te of injection to cardiac arrest caused by mercurial oisoning. The fatalities reported in the literature have l followed intravenous injection; other reactions in- uding severe shock have been observed following all her methods of administration. Hypersensitivity states, icluding asthma, urticaria, fever, and mild shock, have ccurred frequently. After intramuscular injection, the icidence of toxicity is considerably lessened; however, ical pain and irritation are common and objectionable. fforts have therefore been directed toward developing mercurial diuretic which would be less toxic, locally less ritating, and more easily administered than the diuretics ow in use.

In the attempt to reduce mercurial toxicity, BAL (2, -dimercaptopropanol) was combined with a mercurial oup. While this successfully reduced the toxicity, it lso eliminated the diuretic effect.[1] The next step con- sted in combining a single mercapto group with the rganic mercurial. This salt, called mercaptomerin, was emonstrated to be 160 times less toxic than meral- iride (mercuhydrin®) on a cat's heart.[2] It has been in- oduced for subcutaneous use under the trade name of iomerin.®[3]

The following case is reported to warn other clinicians f the possibility of reactions of the sensitive or allergic pe, reports of which have been conspicuously absent the literature.

REPORT OF CASE

C. K., a white woman aged 49, had a long history of rheumatic art disease and had had choking sensations and shortness of eath of one day's duration. The onset of symptoms had ccurred at night while the patient was in bed; she had obtained me relief by sitting up. The symptoms persisted, and she was dmitted to Gouverneur Hospital on Jan. 28, 1950.

She had previously been hospitalized in 1946, 1947, 1948, and 949, for rheumatic heart disease with decompensation. The atient had been seen frequently at the Cardiac Clinic, and was king a maintenance dose of digitalis daily; this was discon- nued one month prior to the present admission. Physical kamination revealed a thin, anxious woman, who was dyspneic nd orthopneic. Positive findings were blood pressure, 150/100; eart rate, 96, with regular sinus rhythm and an occasional extra- ystole; enlarged heart with presystolic and systolic murmurs eard at the apex; accentuated second pulmonic sound; bilateral ioist rales heard at both lung bases; and minimal bilateral pit- ng edema of the lower extremities. A diagnosis of rheumatic isease with mitral stenosis and insufficiency, and cardiac decom- ensation, was made. The patient was treated with meralluride, alt-free diet, and bed rest.

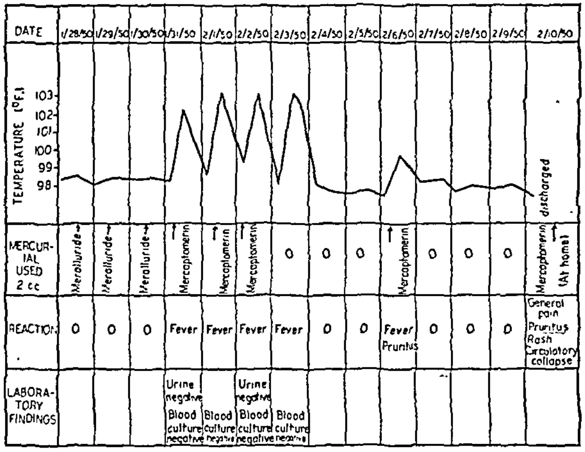
On Jan. 30, 1950, she was digitalized again with digoxin. The ollowing day 2 cc. of mercaptomerin was given instead of eralluride. That evening she began to run a spiking tempera- ure. Examination of the respiratory tract, legs, and urine failed o elicit the cause of the temperature elevation. Urine and blood ultures were all noncontributory. The fever continued until eb. 4, 1950, when it subsided without therapy. The dates of he temperature spikes coincided with mercaptomerin injections. The day after the daily injections were discontinued the fever subsided (Chart).

On Feb. 6 she was again given 2 cc. of mercaptomerin. One-half hour after the injection she complained of generalized pruritus; this subsided after she was given tripelennamine (pyribenzamine®) hydrochloride. She refused any further injections. On Feb. 10 the patient was discharged for home care. That afternoon the visiting nurse gave her an injection of 2 cc. of mercaptomerin at home. Shortly after the injection the patient complained of severe abdominal cramps and generalized pruritus. Tripelennamine was again prescribed, but the symptoms persisted. A local physician was called in and found the patient in a state of circulatory collapse. She was promptly readmitted to Gouverneur Hospital.

The patient's abdomen and chest were covered with a generalized erythematous rash. Blood pressure was 60/30; pulse rate, 60. Other findings were essentially as before. Fluids, sedation, and antihistamine drugs were administered. All the symptoms subsided by the following day, and the patient was discharged two days later.

COMMENT

We consider this to have been an allergic reaction, accompanied with fever, chills, sweating, and circulatory collapse. It is believed that the patient became sensitized to mercaptomerin, and during the last hospital admission manifested this sensitivity. The problem was to definitely establish this premise.



Clinical course after administration of diuretics.

The methods of skin testing for hypersensitivity to drugs were reviewed. The outstanding reports of positive reactions to skin tests with drugs are presented below.

Sherman and Cooke demonstrated a positive passive transfer to sulfadiazine in a patient with a severe clinical reaction to this drug. The presence of a skin-sensitizing antibody to sulfadiazine was demonstrated by means of a patch test with 10% sodium sulfadiazine. After 90 minutes a definite wheal with erythema was noted at the site of the patch. Passive transfer showed a marked reaction to 1% sodium sulfadiazine with a wheal 1.5 cm. in diameter. Controls were negative.[4]

From the combined medical services under the direction of Drs. Theodore Sanders and Arthur Schifrin, Gouverneur Hospital. Resident in medicine, Gouverneur Hospital (Dr. Weissman). Visiting physician, and chief of the Department of Allergy, Gouverneur Hospital (Dr. Gelfand).

Whittemore and de Gara demonstrated a positive scratch test to sulfadiazine and sulfathiazol.[5]

Gottlieb showed a positive patch-scratch test to meralluride in a patient who was clinically sensitive to the drug and who reacted to it with urticaria.[6]

Goodman and Levy performed scratch, patch, and intradermal tests using sulfanilamide both powdered and in solution. In one patient all three tests were negative, whereas in another patient the scratch test was positive, although the intradermal and patch tests were negative.[7]

Wedum successfully sensitized animals to sulfathiazole, sulfanilamide, and sulfapyridine azoproteins made by conjugation with egg whites, beef serum, and human serum. He was able to demonstrate anaphylaxis, positive intradermal tests, and precipitins in these animals, using the homologous chemoprotein.[8]

Generally speaking, however, skin tests with drugs have been uniformly negative in the positive wheal reaction.[9] The delayed inflammatory reaction which usually follows is nondiagnostic, for it may be nonspecific in type and bear no relation to the clinical sensitivity.

The crux of the problem lies in proving the allergic aspects of sensitivity to the drug if the intradermal or dermal skin tests are either negative or show only the inflammatory reaction. A clue to the answer has been offered by Leftwich.[10] The rationale of eliciting a positive intradermal test to the serum conjugate in those who are clinically hypersensitive to a drug is based primarily on the original work of Schönholzer,[11] and Davis,[12] who proved that the sulfonamides could combine with the plasma proteins. Rich [13] proposed the hypothesis that the sulfonamides, when attached to the plasma proteins, probably act as haptens, thus sensitizing the body specifically. Leftwich worked with patients known to be hypersensitive to the sulfonamide drugs. He devised the method of skin testing with serum obtained from patients who were receiving sulfonamide therapeutically and who had a drug level of from 2 to 25 mg. per 100 cc. The sensitizing antigen is thus a sulfonamide plasma p combination which occurs in vivo in the circulating b of these patients during sulfonamide therapy. Sc holzer demonstrated the binding of the azo dye of "P tosil" to serum albumin by means of electropho techniques. Leftwich showed negative skin test reac with solutions of various sulfonamide drugs in pat who were clinically hypersensitive to them. Howeve previously stated, he was able to demonstrate that t serums taken from persons undergoing sulfona therapy who had reached a high drug-serum level, injected *intradermally* resulted in a positive whe action.

Sherman [14] and his associates, as well as Fink, B and Wheeler [15] were unable to corroborate the r obtained by Leftwich. However, Gelfand,[16] in a report, showed a positive immediate wheal react such a test with serum-conjugate taken from a p who manifested a clinical sensitivity to meralluri ilar to the sensitivity to mercaptomerin reported paper. Brown and Goodgold [17] demonstrated an diate skin reaction to serum containing aureomy

Thus, we have a method of demonstrating drug sensitivity by means of the serum-conjugate met cases where the patient is clinically hypersensiti the test with the drug-antigen is either too irritati produces nonspecific reactions or results in a fla tive skin test reaction.

The following method was employed in demon the allergic nature of the sensitivity to mercapto the patient discussed here. At first an ampule sol mercaptomerin and meralluride was used. An i of 0.05 cc. of both drugs was given intradermall forearm with but slight response of indeterminate Serum from the patient during the active phase captomerin sensitivity, i. e., within a short time a date of the original reaction, was then prepared. was also taken from a patient not receiving me and from a patient receiving meralluride; 0.05 cc. of these serums was injected intradermally to small wheal. The mercaptomerin serum-conjug duced a marked positive reaction in the form of a wheal within 20 minutes. The other two serums p negative reactions. Ten months after the cessa mercaptomerin therapy the patient was again te this time, theoretically, the patient's serum wou an antigen-free state; i. e., the mercaptomerin conjugate would no longer be active. As was e the patient did *not* react to her own serum at this t an additional check, the patient was skin test serum from a nonsensitive patient receiving m merin at the time the tests were done. This ser tained the active serum-conjugate of mercapt When injected intradermally, a positive wheal r was produced. Normal human serum produced tive reaction.

This then is a case of hypersensitivity to me merin that is manifested clinically by fever, ab cramps, pruritus, an erythematous rash, and cir collapse, and demonstrated rather conclusively b of the intradermal wheal reaction.

K PARALYSIS

ORT OF A CASE

lah M. Kittrell, M.D., Maryville, Tenn.

he bite of certain female wood and dog ticks results generalized flaccid paralysis, which terminates fatally ss the tick is found and removed. Although this syn- ne has been recognized for almost 50 years, a cursory ew of the literature indicates that this fact is not gen- ly known. Tick infestation is widespread, but the case reports come from limited areas, many states er having reported its occurrence.

he following case is presented to call attention to the as the possible cause of unexplained ataxia and alysis and to the fact that its removal results in rapid complete recovery from an otherwise fatal illness. re have been no other cases reported from Ten- see.

REPORT OF CASE

healthy 4-year-old girl awoke in the morning with incoordi- on of both upper and lower extremities. She refused to get out ed or to feed herself. She did not complain but stated simply her feet felt "soft and flat." Her movements were too unco- nated for her to feed herself, but she ate heartily when fed ier mother. On attempting to stand, she swayed from side to , then crumpled on the floor. With support, she staggered ss the room, but apparently had complete loss of muscle e or direction. There was no history of antecedent illness. The before, her movements had appeared awkward, and she had once that her feet "felt queer." This was thought to be be- se of the cowboy boots she had been wearing and was of significance except in retrospect. Family and past history e noncontributory.

he findings of the physical examination made four hours r the onset of the illness were negative except for neurologi- signs. The child was sitting up in bed and appeared appre- sive and uneasy. Her eyes had a glassy stare, and there was ie tremor of her hands. There was questionable thickness in voice. She was fully oriented but was cross and noncoopera- .

ensation was normal. There was bilateral absence of biceps l triceps reflexes in the upper extremities. The degree of in- rdination was difficult to estimate, because she refused finger- ose and other tests. All superficial abdominal reflexes were ent. There was bilateral absence of knee jerks. She could se her legs normally and flex both knee and hip joints. Plantar flexion and extension were good. On attempting to stand or walk she repeated the same ataxic pattern exhibited on arising.

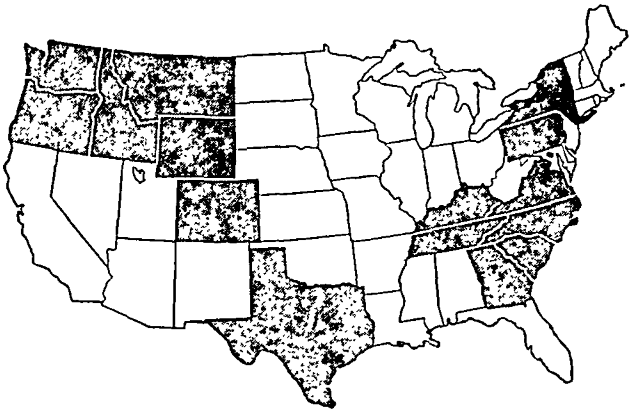
A consultant was called, and while hospitalization and spinal studies were being discussed, a moderately engorged tick was accidentally felt in the left occipital region. It was removed intact. Two hours later, the child walked across the room unsupported and of her own volition. Her gait was unsteady, but she did not fall. Before, it had required a great deal of coaxing to induce her to attempt to get out of bed or walk. The following morning her gait was normal and all reflexes were present. She has been well since.

The tick was identified as Dermacentor variabiles Say, or the common dog tick, which is prevalent throughout this area. It had been removed alive and placed in a glass jar. The following morning there were three stacks of eggs in the jar. It was felt that it was possible to make a diagnosis of beginning tick paralysis because there were present sufficient criteria: (1) severe ataxia with loss of reflexes, (2) discovery and removal of a female tick, and (3) rapid and complete recovery.

COMMENT

Although ticks are widely distributed throughout the United States, only fourteen states and the District of Columbia have reported tick paralysis. These cases have been concentrated in certain areas of the extreme Northwest and in the South, to the Atlantic seaboard.

The files of the Rocky Mountain Laboratory of the United States Public Health Service (Helena, Mont.) show an average, since 1903, of 2.7 cases per year in the states of Montana, Oregon, Idaho, Washington, Wyoming, and Colorado. The paralysis resulted from the bite of the Rocky Mountain wood tick (Dermacentor andersoni Stiles), and up until 1938 the disease was thought limited to this insect's range, since no cases had been reported elsewhere.



States from which tick paralysis has been reported (shaded areas).

The first recognized case east of the Mississippi River occurred in South Carolina, in 1938.[1] Since then, 16 other cases have been reported,[2] giving an average of 1.4 per year. All have been south of the Mason-Dixon Line except for one in Pennsylvania[3] and one in New

York.[4] The tick, when identified, has been D. variabiles Say, prevalent throughout the central and eastern United States.

The few cases reported are from only small sections of the vast areas inhabited by the two types of ticks. With their almost universal distribution it appears the disease would be more widespread.

The paralysis is believed to be due to a specific neurotoxin produced by a limited number of pregnant female ticks. Symptoms are mild and transient if the tick is found and removed early. If it is not found until bulbar signs are present, death results from respiratory failure. The only treatment is for the physician to think of tick paralysis whenever signs and symptoms of unexplained paralysis are present and remove the tick.

Jellison and Gregson,[5] in a review of the cases occurring in the western United States and British Columbia,[6] state that, even in areas where there is widespread knowledge of the disease, deaths continue to occur. They cite two instances in which ticks were found and removed by morticians.

CONCLUSION

Although tick infestation is known to be widespread, few cases of tick paralysis have been reported. Since most textbooks mention only that such a syndrome is known to occur, and since so few cases have been reported in the current literature, it seems likely that many cases may be overlooked.

SYMPATHECTOMY PRECEDING LIGATION OF THE CAROTID ARTERY

REPORT OF A CASE

Paul G. Flothow, M.D., Seattle

In 1935, after ligation of the subclavian artery, followed by immediate sympathectomy without ill effects, I suggested that whenever it became necessary to ligate a major blood vessel anywhere in the body that it would be wise to precede this ligation by sympathectomy, or if the vessel were ligated inadvertently, an immediate sympathectomy at the proper level would insure against a vascular catastrophe.

I offer the following case report to illustrate the application of this principle in ligation of carotid arteries.

REPORT OF CASE

History.—The patient presented herself on June 10, 1949, with the history of a malignant tumor removed from the right side of her neck in December, 1947, with immediate left-sided hemiplegia, the surgeon having been forced to ligate the common carotid artery. The paralysis had improved somewhat, but she still had a spastic left hemiparesis. She was informed that the tumor was malignant but not cancerous. The surgeon wisely declined to remove the tumor on the other side which was of approximately the same size.

The patient complained of pain in her neck and
side of her head, and, since the tumor mass was enlarg
was very much worried for fear it was cancerous. This
was 40 years old, and in view of the fact that ligation
carotid artery two years before had resulted in hemiplegia
fair to assume that a ligation of the other carotid would
hemiplegia on the other side.

While I felt quite confident that cervicothoracic sympath
would normally prevent the development of hemiplegia,
particular case, the other carotid having been ligated, I
that this factor might prevent the establishment of the
lateral circulation necessary to prevent hemiplegia unless
spasm were the important factor in its development.

The various possibilities were discussed with her, and
insistence surgery was very reluctantly undertaken.

Operation.—Surgery was performed on Sept. 9, 1949. Th
a supraclavicular incision a cervicothoracic sympathectom
first done, with removal of the inferior cervical and fir
second thoracic ganglions and the trunk. This wound was
closed and another incision made for removal of the
body tumor. The tumor mass was approximately 4 cm. in d
ter, and it was impossible to remove the tumor mass w
ligation of the carotid vessels above and below the tumor
procedure was carried out, ligating two vessels above a
below, all of which were undoubtedly the common carot
the internal and external carotid arteries. The patient m
uneventful recovery without even a trace of hemiplegia
result of the ligation of the carotid arteries, in spite of
that the opposite carotid had been ligated previously.

It is a well-recognized fact that, in spite of
preliminary digital or mechanical compression
carotid arteries, not infrequently, when the car
finally ligated, hemiplegia does occur. This pheno
can be explained by the fact that ligation of the
produces an immediate and marked vasospasm
entire vascular tree which is not produced by th
preliminary compression. This vasospasm is, of
avoided when preliminary sympathectomy is do
it is my opinion that this is the most important fa
volved in the development of the hemiplegia.

COMMENT

My associate, Dr. Hunter J. MacKay, has h
casion four times during his naval experience
three occasions since then to operate for axillary
rysms, and on each occasion he has preceded th
ation by cervicothoracic sympathectomy. There ha
instance been any vascular insufficiency resultin
ligation of the axillary artery.

CONCLUSIONS

The above cases, reported with their results,
a fair assumption that, in any case in which it b
necessary to ligate a major blood vessel, this ligati
be immediately preceded or immediately followe
suitable sympathectomy with a great deal of ass
that there will be no ill effects as a result of the lig

E OF HUMAN SERUM ALBUMIN IN REBRAL EDEMA FOLLOWING RDIAC ARREST

PORT OF A CASE

nk Cole, M.D., Lincoln, Neb.

Human serum albumin was first used to combat post-sthetic encephalopathy by Seldon and associates.[1] wever, in the two cases they described, there was no diac arrest. In the case presented here, human serum umin was administered in a post-asystolic syndrome.

REPORT OF CASE

t 7:40 a. m. on June 21, 1950, a tetracaine-procaine spinal sthetic was administered to a 21-year-old white man, by his geon, for right inguinal hernioplasty. The injection was made he second lumbar interspace after administration of 50 mg. phedrine. Six minutes later the level of anesthesia was at the bilicus; the head was then raised. During the next 30 minutes blood pressure fell progressively, but not too precipitantly. bon dioxide and oxygen were given for nausea and perhaps llow respirations. By 8:20 a. m. the blood pressure was 100/60. minutes later the patient became both apneic and pulseless. head was lowered, and after several minutes oxygen was ninistered under pressure.

he patient was cyanotic; his pupils were widely dilated. His or improved after one minute, but, although 1 cc. of epineph- hydrochloride and 1 cc. of pentylenetetrazole (metrazol®) e administered intravenously, the heart remained flaccid. A lline subensiform incision was made, and the heart was mas- ed for three minutes. Finally, 1 cc. of epinephrine was injected the heart. Two minutes later the first feeble heart beat was ed. The contractions gradually became stronger and regular hythm and volume. At 8:35 a. m. the patient drew his first untary breath since the appearance of cardiac arrest. Within minutes respiration was deep and apparently normal, and the ration was resumed.

t 9:20 a. m. both incisions were closed. The patient was ced on a cart, where he immediately became spastic. The sticity became severer; the breathing was stertorous. Pink, thy pulmonary secretions appeared, which were aspirated. neralized spasm appeared, then rigidity and convulsions. The nvulsions continued until noon, being stopped three times by avenous administration of thiopental (pentothal®) sodium. patient continued to have a considerable amount of mucus. first saw the patient at 12 noon, while he was still unconscious d in convulsions. The respiratory rate was 40, the pulse rate , and the blood pressure good. The color was fairly good ile he was receiving oxygen; without it, he was cyanotic. He s given 5 cc. of thiopental sodium and 50 cc. of 50% glucose ravenously. The convulsions stopped, and the rigidity gradu- y declined. At 12:30 p. m. his rectal temperature was 105.2 F d blood pressure 140/85.

On arriving, I had substituted a Guedel pharyngeal airway the mouth gag that was being used. The BLB (Boothby-Love- e-Bulbulian) mask was now removed, and an ordinary face sk connected to an anesthesia machine was applied. Oxygen der pressure of 4 mm. Hg was administered to combat the lmonary edema; the inhaling breathing tube was surrounded cracked ice. The increased pressure promptly cleared the pul- onary edema. Glucose was again given intravenously at 1 p. m. this time the temperature was 104 F, pulse rate 112, respira- n rate 36, and blood pressure 138/85. It had been apparent rlier that cerebral edema was present, and at 1:30 p. m. 100 cc. human serum albumin (containing 25 gm. of albumin) was ad- inistered intravenously.[2] At 2 p. m. the patient opened his eyes d appeared to swallow. The temperature fell to 102 F. A half- ur later he moved for the first time, turning over onto his domen. At 3 p. m. 100 cc. of human serum albumin was ain given intravenously. He was returned to his room at 4 p. m. t 6 p. m. he was quiet, tolerated the pharyngeal airway, and had elash, corneal, and pupillary light reflexes but did not appear see. He appeared to respond to sound occasionally. At 8 p. m. the respiratory rate had fallen to 24. At 10 p. m. he seemed to see a friend who was in the room and extended a hand to him. He rose to his knees and voided in bed. He no longer tolerated the airway and appeared to stare constantly.

At 6 a. m. the next day he phonated loudly but did not speak. He grimaced frequently and resisted being moved. A dose of 100 cc. of human serum albumin was injected intravenously. Now good color could be maintained without oxygen. On the third day he was able to hear and see and to recognize people. He said he ached "all over," pointing to the regions just behind, or lateral to, the eyeballs. He spoke intelligently and could eat and drink easily. At 6 p. m. that day he stood and walked with assistance. Later that evening he spoke well and read small print with understanding. He wrote his name with great effort and had difficulty with the spelling. He was disoriented to time and space. He was unable to remember my name after being repeatedly prompted. Neurological findings were negative, except for the finger-nose test. That night he remained awake and was particularly active and disoriented. On the following night he was again active. He suspected his nurse and men he thought he saw on a roof of wanting to kill him. He was given 1½ grains (0.10 gm.) of secobarbital (seconal®) sodium by mouth, with good results. Hallucinations continued the next day, but only intermittently. He was now physically well, and the urinary output was adequate.

At 8 p. m. on June 25 he was irrational again and spoke of traveling from Mars and of an interplanetary war. He began to improve again on June 27. His conversation was moderately animated and reasonably intelligent. On the evening of July 1 he recognized me for the first time and called me by name. He walked only a trifle unsteadily but was still somewhat confused. On July 15 he was still continuing to improve. He conversed well and spoke of his studies, which he was eager to resume. The only change apparent to a friend who had known him well before his operation was that he was somewhat less vivacious than before. His memory for events immediately preceding the operation was imperfect but improving. A few days before he had thought he had done twice what he had really done only once and had thought that two persons had visited him when only one had been there; this phenomenon soon disappeared, and it was felt that his recovery was complete.

COMMENT

In suggesting the use of human serum albumin immediately after a period of cerebral anoxia, Seldon and associates [1] offered the following hypothesis:

> Permanent damage to the brain as a result of acute cerebral anoxia not only is a function of the duration of the anoxic episode, but also, in the case of sublethal periods of anoxia, must be conditioned by the duration and severity of a period of post-anoxic cerebral edema. It is suggested that a considerable portion of the permanent cerebral damage reported in these unfortunate cases may be the result not of the initial insult, but rather of a period of untreated cerebral edema subsequent to the initial insult.

The pathology would appear to be the same, whether it followed anesthesia or asystole: cerebral (and pulmonary) edema following anoxia. Administering human serum albumin in the post-asystolic syndrome proved to be equally beneficial here.

SUMMARY AND CONCLUSIONS

Cardiac arrest occurred during spinal anesthesia in a 21-year-old man undergoing hernioplasty. Cardiac massage was started within five minutes; asystole was present

Reviewed in the Veterans Administration and published with the approval of the chief medical director. The statements and conclusions published by the author are the result of his own study and do not necessarily reflect the opinion or policy of the Veterans Administration.

[1] Seldon, T. H.; Faulconer, A.; Courtin, R. F., and Pino, D. M.: Postanesthetic Encephalopathy: The Postulation of Cerebral Edema as a Basis for Rational Treatment, Proc. Staff Meet., Mayo Clin. 24:370 (July 6) 1949.

[2] The human serum albumin was supplied without cost by the American National Red Cross, Omaha Regional Blood Center.

for 11 minutes. Cerebral (and pulmonary) edema followed, with coma, convulsions, cyanosis, hyperpyrexia, tachycardia, tachypnea, and insensitivity to light. Human serum albumin was administered intravenously three times. Recovery was complete within three weeks.

A new weapon has been added to the physician's armamentarium in the treatment of cardiac arrest and its sequelae. During asystole, artificial respiration and artificial circulation by cardiac massage are mandatory and efficacious. After a period of anoxia, cerebral edema often appears, for which intravenous human serum albumin seems to be an agent of choice.

Veterans Administration Hospital, 74th and J St.

SPECIAL ARTICLE

This special article was prepared by Dr. Henry H. Kessler after his visit to Yugoslavia as an expert consultant to make a survey for the Technical Assistance Administration of the United Nations. The report of the survey has been submitted to the United Nations as a 150-page document. A brief summary is included in THE JOURNAL *for those physicians who have expressed an interest in foreign medical education.*—Ed.

MEDICINE IN YUGOSLAVIA

Henry H. Kessler, M.D., Newark, N. J.

One of the brightest chapters in the history of medicine is the contribution made by the medical profession in Yugoslavia. Faced by shortages of personnel, supplies, and beds, and against superhuman obstacles, they have shown a devotion to duty, a technical competence, and professional loyalty that symbolize the epic character the ideal physician.

As a result of the war, one of the primary problems facing the country and the medical profession was the great shortage of doctors—1,500 physicians were lost in the war, leaving only 6,000 to carry the burden of medical care for 16 million people. Half of the remaining doctors are 50 years of age or older. Many of them divided their time between military duties and civilian care. To the load they were already bearing was added the burden of illness and disability that resulted from the war.

Furthermore, the rapid industrialization program was producing a toll of accidental injuries that was competing with the automobile casualty rate in the United States. In the face of all these responsibilities, and in the presence of the extraordinary political, economic and social problems of the country, the record of medical activities is remarkable.

Meeting the medical needs of the nation at the close of the war became a challenging responsibility for the authorities. Because of the close association of the Yugoslavs with the Russians, it was suggested that the former adopt the Russian "Feldscher" system, a throwback to Czarist times, in which certain individuals without formal medical training were given major medical responsibilities. In rural areas particularly, the "Feldscher," whose training and experience were less than those of the corpsmen in our armed forces, and more nearly appr
those of a first-aid man or orderly, frequently as
prerogatives that included minor surgery and, oc
ally, major surgery.

The medical profession of Yugoslavia is to b
gratulated for turning down this suggestion. Th
ferred to assume additional burdens of work a
sponsibility in order to maintain their profe
standards. Thus one finds men like Professor J
the University of Belgrade Medical School, oc
not only the chair of neuropsychiatry but also th
ship of the medical school, presidency of the
Medical Society, presidency of the Yugoslav Re
and many additional positions of responsibility.
sor Nedo Zec in Sarajevo, formerly Minister of
for Bosnia-Hercegovina, is dean of the medical
professor of neuropsychiatry, director of the me
pital and professor of medical jurisprudence of
school.

MEDICAL EDUCATION

Despite this requirement, it is difficult to get th
to practice in the country. As in capitalistic na
doctors prefer to remain in the big cities.

Despite this elaborate program of medical e
it will take 10 years to meet the goal of 16,00
since no more than 1,000 doctors can be ex
graduate each year. This has forced the auth
engage foreign doctors under contract. Banja
town of 40,000 with a 700-bed hospital, has
a gynecologist from Carlsbad who is quite hap
position and well qualified to give service.

is being projected as the future Pittsburgh of Y
and has been affectionately referred to as the
Ruhr because of its coal and iron resources, n
developed. A small blast furnace, forge, and rol
are already transforming the primitive country
site of heavy industry. The hazardous work o
dustry requires constant medical control, and
doctors are employed at the pits and mines. In

preemployment examinations, a full program of medi- l care is carried out at home, in the hospital, and on outpatient basis. In Zenica, a former Austrian phy- cian from Graz is now employed by the Yugoslavs. At e close of the war, the physician was liberated as a isoner of war but returned to Graz; in a few months he plied for a position as a contract physician and was nt to Zenica. His salary is 10,000 dinar a month, 4,000 nar a month greater than the salary of the local Yugo- v physicians. When the latter were asked if they sented this large difference in pay, they replied that ey were quite happy with the arrangement. If their rmer enemy was willing to return and help them rebuild e country, he was entitled to the maximum compensa- n.

MEDICAL ECONOMICS

It is difficult to translate foreign currency into dollars, ce the purchasing power of the currency and the ailability of goods influence the value of the currency. ficially, the dinar is worth two cents, or 50 dinar to e American dollar. The average pay of a doctor is 000 dinar, or $120, per month, hardly enough to take re of his needs. Roughly, it takes 12,000 to 15,000 nar for a physician, his wife, and two children to live fair circumstances. To meet expenses, the doctor's fe is frequently employed as a doctor, pharmacist, in- rpreter, or in whatever capacity her special talents stify. The combined salaries of the two help meet the eds of daily living.

The doctor is employed on a full-time salary basis and s no other income unless he takes on several jobs. For ample, the limb-fitting surgeon at the chief artificial nb factory in Belgrade spends half a day at this factory d the other half at one of the local hospitals.

University professors may carry on a private practice. enerally, the fees are about 150 dinar a visit, and if e doctor devotes enough time to his practice he can ake a comfortable living. However, he is frequently able to devote himself to his practice since his duties the medical school and hospital take up much of his ne. His position as a professor, however, affords him opportunity to earn additional revenue by giving ecial lectures, writing articles, editing books, and per- rming other extra-curricular professional assignments. urthermore, his academic position permits him better using. For example, he is permitted to have a separate om in his home for carrying out his academic assign- ents such as the preparation of lectures. He is also per- itted to have an office and examining room for his ivate patients. Housing being at a great premium, this an item of considerable importance.

About 10% of the doctors devote themselves ex- usively to private practice; some derive substantial comes, but the results are variable. Although surgeons ay charge for the visits and examinations, they cannot ake any charges for surgical procedures performed in ate or public hospitals. All incomes, of course, are sub- ct to government income tax.

The rate of wages and salaries for physicians must e evaluated in terms of compensation to workers and ther professional groups.

The average worker receives about 5,000 dinar a onth, but can increase his income by overtime work, or by work in especially hazardous occupations. The workers in the famous Litostroj steel plant, a miniature United States Steel Corporation, average about 8,000 dinar a month.

On the other hand, journalists, artists, writers, actors and musicians receive 10,000 to 12,000 dinar a month. Among the highest paid workers are coal miners, who receive up to 15,000 dinar a month.

A teacher in a school for deaf or crippled children receives 3,500 dinar a month. A student scholarship provides a subsidy of 2,500 dinar a month. If the student is married to another student, the combined income of 5,000 dinar provides them with just enough income for bare existence. This hardship can be understood from the fact that food requires about 85% of the average person's income. Clothing, which is frequently rationed at regular prices, can be bought on the free market at highly inflated prices. For example, a pair of shoes on the free market costs 4,000, a shirt, 3,000 and a suite of bedroom furniture, 110,000 dinar.

MAJOR HEALTH PROBLEMS

The Balkans are the most complex countries in the world. Centuries of invasions and counter-invasions, epidemics and primitive living have left a legacy of disease and invalidism. Conflicting religious beliefs, political allegiances, and ethnic differences served only to complicate the picture. World War II, in which 1,700,000 persons were killed, performed the great miracle of unifying the various elements, however.

The major health problems are those of infectious diseases. Typhus and malaria, rampant for centuries, have just recently yielded to the magic touch of dichlorodiphenyltrichloroethane (DDT). Endemic syphilis involves 10% of the population of Bosnia. Of all the diseases, tuberculosis is the great maimer and killer—the incidence runs from 1.1% of registered cases among the population of Ljubljana to 2% in special sections of the country studied by Neubauer. If Neubauer's ratio were applied to the total population of 16 million, it would reveal a tuberculosis incidence of 320,000 cases.

It has been estimated that 500,000 men, women and children, victims of war injuries, accidental injuries, disease and congenital defects, require rehabilitation services.

PUBLIC HEALTH ORGANIZATION

To meet these needs, Ministries of Health and Ministries of Social Affairs have been established in each of the six republics: Serbia, Croatia, Slovenia, Bosnia-Hercegovina, Macedonia, and Montenegro. At the federal level, the Federal Committee of Health coordinates the work of the ministries of health in the various republics. This department controls the sanitary services, all preventive and curative medical services including hospitals, sanatoria, polyclinics, dispensaries, mobile hospital units, and all the medical personnel including those concerned with medical education in all its aspects.

The Minister President of the Federal Committee of Health meets with the Ministers of Health of the various republics to review the health problems of the nation. The results of these conferences are translated into legislative recommendations which are then passed on to the President of Parliament and may be enacted into a law

(*Zagrund*) or, where emergency conditions require it, an *Urbar* or decree. These are sent to Marshal Tito for signature and go into effect immediately.

SERBIA

In southern Serbia there are 500,000 shepherds who live under the most primitive circumstances, constituting a health menace not only to themselves but to the entire nation as well. The need for public health education to raise the level of health interest and intelligence is concomitant with the need for improved living conditions.

There are 55,000 hospital beds in Yugoslavia, of which 17,500 are in Serbia. In Belgrade, in addition to the state or national hospital of 1,000 beds, there is a 2,000-bed military hospital. Several private hospitals have been taken over by the government. One of these, a 100-bed hospital, has been converted into a plastic surgery unit with a staff well trained by several British plastic surgeons. Another 60-bed hospital has been converted into a traumatologic or emergency hospital, while a third, a former private sanitarium, contains 50 beds for general medical and surgical purposes.

Medical services are carried out, for the most part, in polyclinics or outpatient dispensaries. Regional polyclinics are available to meet the needs of different sections of the city, with one very large central polyclinic (a former office building) providing the major diagnostic and treatment facilities.

The need for auxiliary medical personnel is as great as the need for doctors. From 1918 to 1941 only 1,253 men and women graduated from the middle medical technical school as nurses, nurses' aides, x-ray technicians, laboratory technicians, and physical therapists. In the past few years 56 new schools have been established, from which 1,750 were graduated in 1949.

Fifteen to 20 medical journals are published throught Yugoslavia, with summaries of articles in French and nglish. The problem of supplying books to the medical students has been partially met by the publication of medical books in Serbian by the government printing office.

Among the outstanding medical personalities in Belgrade is Professor Dimitrije Jovcic, professor of orthopedic surgery and director of the surgical section of the children's clinic. Following the tradition of Ombredanne, his preceptor, he carries out the entire gamut of childhood surgery including general surgery, neurosurgery, orthopedic, and plastic surgery. Professor Voia Stojanic, in charge of general surgery, is another prominent surgeon who is well known for his contributions to his field and for his visits to various international meetings.

MACEDONIA

Suppressed by long years of political problems, Macedonia nevertheless exhibits a fierce will to wipe out its centuries-old cultural lag in a comparatively short time. Illiteracy is gradually being abolished. The problem of minority groups still exists, but the many Albanians, Shiptars, Turks, and Bulgars are permitted to use their own languages, schools and religions, and carry on their own cultural activities.

The determination of the Macedonians to catapult themselves into the 20th century is especially evident in
Skoplje, where the swift Vardar separates the old
from the new. In the new town one observes the eli
tion of the old Turkish quarters, with their foci of di
and the creation of large squares. Modern building
pear anachronistic next to the remaining struc
Crossing the bridge into the old town is like returni
the middle ages, with its medieval atmosphere a
melange of diverse national and ethnic groups prac
the customs of 500 years ago. There are narrow n
roads that pass for streets, and open bazaars. In con
one also sees long queues before the various shops
rationed goods, women with veils which they fur
remove when crossing the bridge to the new tow
just as furtively replace when returning to the old.

In Skoplje one finds some of the most rapid pr
made under present conditions as compared to p
and immediate postwar periods. A new medical s
accommodating 500 students, has been establish
university hospital of 800 beds caters to the needs
city's population. An idea of the frenetic efforts t
the training of medical and ancillary personnel n
gained from the projects already completed and i
ress. Five hundred men and women are being trai
nurses' aides and dental aides. One hundred mi
are attending a midwifery school. There is a sch
dental mechanics.

There are four dispensaries in addition to th
polyclinic serving the needs of the local populatio
dispensary has facilities for dental care. In addi
the general dispensaries, there are 14 childre
pensaries and 13 children's mobile health units in
donia. The differences lie in the fact that the do
the dispensaries make house visits while the
health units provide outpatient services only.

Professor Jubasic is the outstanding surgeon, c
ing a highly organized and skillful service of 200
the university hospital.

BOSNIA AND HERCEGOVINA

Bosnia, which is now becoming the center o
industry, was the scene of the heaviest guerilla
in the war. It has a population of 2,700,000, o
one million are Moslems. Until 1918 it was r
Austria. Between 1918 and 1941 the economi
the average individual had changed little from the
ism that had previously existed. Under such
stances, there was never any money to buy soap
linen. Centuries of living in filth had inured the
to any possible hazard of disease, about which t
little knowledge and less interest.

Sarajevo, the chief city of Bosnia, has a po
of 140,000. It is noted as the place where the Firs
War had its beginning. The university clinic, a 1,5
hospital, is in Sarajevo. Professor Kovacic, head
320-bed surgical service, sparks the institutio
organization of the hospital, the technical skill dis
and the quality of service and care would mea
to that found in the hospitals of any modern A
community.

Nevertheless, the incidence of disease and in
is still very high. There are 15,000 cases of acti
monary tuberculosis registered in Bosnia-Herce

ere are four to five thousand cases of bone tubercu- is, a higher incidence than in Macedonia, which has en attributed to differing customs of food preparation the two republics.

An interesting feature of public health legislation has en the removal of all veils from Moslem women. This itary measure revealed that many men were masque- ing as women.

Industrial accidents, accounting for 24% of the mor- lity rate, is a serious public health problem. The inci- nce is second only to gastrointestinal disorders, with incidence of 32%.

Zenica, a city 100 km. north of Sarajevo, is the scene a rapidly developing heavy industry. The small 90-bed spital is inadequate for the needs of the miners, the el workers, and the community.

Banja Luka, in the northern section of Bosnia, was scene of heavy fighting during the war. Fifty per cent the city was destroyed and the ravages of war are still evidence. Nevertheless, the city boasts a modern 700- l hospital which serves not only the city but also 700,- 0 persons in the environs. Tuberculosis is the chief lth problem, but endemic syphilis, rickets, malnu- ion and rheumatism also abound.

DALMATIA

The favorable climatic conditions of the Dalmatian ist have made it a favorite area for rest homes, hotels weary workers, and sanitoria for the treatment of ne and joint tuberculosis. Treatment in the sanitoria conservative, with prolonged bedrest, streptomycin, tension, and plaster immobilization.

SLOVENIA

Slovenia, with a population of 1,400,000, is one of most progressive of the republics and has a high ndard of living. There are 6,500 hospital beds in venia, of which 700 are devoted to pulmonary tuber- losis, and 200 to bone and joint tuberculosis. The medi- l school has been expanded since the war and now ludes a five-year course which will soon be extended six years. There is an 1,800-bed general hospital, in iich 6,000 operations are performed annually. Gastro- testinal diseases are first in the morbidity statistics, th accidental injuries second. There is a high incidence cancer.

CROATIA

Croatia, the second largest republic in Yugoslavia, has population of over 3,500,000. Zagreb, its chief city, uses the oldest medical school in Yugoslavia, the ugoslav Academy of Science, and the institute of public alth. The institute, established many years ago with e help of funds from the Rockefeller Foundation, is ider the direction of Dr. Stampar, one of his country's itstanding personalities. The institute of public health fers graduate and undergraduate courses in the fields public health and industrial hygiene. The institute has any laboratories, a library, museum, and photographic cord department. The institute, with its staff, is doing ioneering work in the increasingly vital field of public nd industrial health and hygiene.

SUMMARY

This survey of health conditions and facilities in Yugoslavia reveals, first of all, the intense devotion of the medical profession to its responsibilities under the most difficult conditions. Secondly, one observes the great need of the Yugoslav physicians for contact with the scientific literature of the past decade. My meeting with Marshal Tito indicates that the profession will be given this opportunity through books, periodicals, films, and personal contacts. I recommended to the United Nations that 20 fellowships be established to permit Yugoslav medical personnel to visit Great Britain and the United States.

The philosopher Paulsen has said that the object of all help is to make help superfluous, and this ideal is being realized through international action.

53 Lincoln Park.

COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

This paper is one of a series requested by the Council on National Emergency Medical Service to inform the medical profession on problems pertaining to civil defense. It does not necessarily reflect, however, the opinions of the Council or of any other official body unless so stated in the article.

C. Joseph Stetler, *Secretary.*

MENTAL HEALTH AND CIVIL DEFENSE

Ozro T. Woods, M.D., Dallas, Texas

The national concept and philosophy of civil defense developed during World War II. It was the first time in warfare that the people at home were in danger from attack. We hurriedly set up a civilian defense organization. We developed a program while conducting the war. As the war progressed more successfully, the civil defense effort receded rapidly. It was practically abandoned by the end of the war. Civil defense contributed little to the winning of the war. Citizens in general did not then, and do not now, understand the relationship of a civil defense to the strength or survival of the nation, for this country has never experienced a crisis in which a long-sustained, supreme effort on the part of every citizen and each community was necessary for national survival. The comfortable family and community way of life has been relatively little disturbed by our last two wars.

CIVIL DEFENSE AND NATIONAL SURVIVAL

We can learn something from the experience of Germany in civil defense. Because collapse on the home front had been an important factor in their losing World War I, ". . . emphasis was placed on the fact that the emergency medical services had to be organized, equipped, and trained before World War II started. The completeness and excellence of the service were publicized for their effect on the morale of both civilians and military. The

---

Chairman, Council on National Emergency Medical Service, Texas State Medical Association; Associate Director, Civil Defense, and Chairman, Health Division, City of Dallas. Director of the Emergency Medical Services studies in the Civilian Defense Division of the United States Strategic Bombing Survey in Europe following World War II.

soldier at the front was assured that every protective measure was being taken for his family at home because of the experience gained in the first war when worry about home conditions had had a demoralizing effect on the troops."[1] The morale-building influence of an excellent civil defense plant protection was largely responsible for the low rate of absenteeism in the submarine shipyards in Hamburg that were bombed almost daily.[2]

This nation and its allies are now facing an enemy whose strength, resources, and methods of attack challenge us as a people to be strong, determined, and prepared on the home front as well as on the military front. There is a tendency to feel that the only danger is in the area of military combat. The activities of our enemy are known in other parts of the world. Our country faces these same dangers. I think they are best described by Paul G. Hoffman,[3] "To most of us, war's aim and end is victory on the field." To the Kremlin, military action is but the most visible and spectacular zone of combat in an unremitting war against a free world. Herein lies the strange, new, and often hidden danger—a danger we cannot fend off by arms alone. We must realize that, for the Kremlin, the military is only one of four fronts, each a battleground of implacable attack. These four fronts are the military, economic, political, and psychological. Lenin himself has defined them. He has declared that they comprise the four interlocking parts of a "most determined and ruthless war, a persistent struggle, bloody and bloodless, violent and peaceful, military and economic, educational and administrative, against the forces and traditions of the old society." Every level of our government, from federal to local, must facilitate and coordinate efforts to meet these dangers.

ROLE OF MENTAL HEALTH IN CIVIL DEFENSE

Within the people themselves are the ultimate resources for winning a peaceful world. There is a measurable limit to the supply of copper, tungsten, or other materials for making weapons to wage war. There is almost no limit to what a determined and resourceful people can do when they are strong and healthy, behave intelligently, and utilize their resources effectively. The organization of intelligent behavior is an important function of civil defense. The President has appointed Gordon Gray to head a board to coordinate the "strategic psychological warfare of ideas with the military and economic phases of our foreign policy." This long-needed board operates at a super-Cabinet level. There is no adequate machinery to coordinate the civilian activity in our domestic defense efforts in a similar manner. Some of these functions must be assumed by civil defense. There must be planning and education in order to develop an effective psychological defense through every organized, functioning group in society (governmental, professional, and social).

Into our thinking must come a determined conviction that the American way of life must be protected by developing and improving it. Our place in international society
must follow biological laws in which increasing v
and strength of growth are the determining factors. W
chairman of the National Security Resources Bo
W. Stuart Symington said, "Health and strength are
and the same. Survival of the fittest was the law of pr
tive jungle and is, in fact, the law of all life on this e
As a nation, we are strong today because we are he
in mind and body. We know that our basic strengths
prevail against any attack. But we must be eternally
lant to increase our powers to the full. We must be st
to survive as a free nation." Health and welfare ser
of civil defense are its most important activities.
citizen's interest in civil defense, even if it is apathe
largely in the health and welfare field, and Congres
given most of the meager funds to it.

The emotional unrest and confusion about civil de
is the immediate mental health problem. It should
great concern to everyone that there is not devel
rapidly a strong civil defense program. To many

ıal defense. Every citizen's effort is important and essary to build the national defense, no matter where ives or what he does. Our responsibility and services ivil defense are just as important as our obligations he armed services.

TRAINING OF PHYSICIANS

rganization.—Responsibility for the organization of health program of civil defense has been largely ed in the hands of local and state public health ers. We, as practitioners, have had little part in planning of civil defense, although we are the ones must furnish the health services. Following the tradi- which has characterized our profession, we have the of training ourselves. This, I think, should be the onsibility of organized medicine at the national, e, and county society level. Every state association been asked to organize a Council on National Emer- cy Medical Service. Every county society should have ivil Defense Committee. The Texas State Medical ociation has given its Council on National Emergency lical Service the responsibility of organizing and con- ting teaching courses for its membership. This coun- s to work with the Council on Public Relations in ulating physicians to assume community leadership ivil defense.

eaching Materials.—Most of the information needed these training courses is in preparation and will soon vailable. These materials are being organized by the lth and Welfare Division of the Federal Civil Defense ninistration. A large part of the preparation is being e by such authoritative bodies as the National Re- ch Council and the Department of Defense. We uld ask the Federal Civil Defense Administration to pare outlines in the form of texts and references for teaching.

ubject Matter.—The teaching material can be roughly sified under two subjects. The first is the nature of special weapons of warfare and how they cause in- es. The treatment of these injuries is the same as we in every day practice. We need to learn only a few cial techniques of treatment and to adapt ourselves to e standardizations of treatments so we can work with er physicians and with the supplies that will be fur- ed.

he second subject is that of mental health or psycho- ical defense. This can be discussed under two head- : (*a*) the emotional needs of the individual patient; prevention and control of panic or group disruptive avior.

EMOTIONAL NEEDS OF THE INDIVIDUAL

Many patients needing the attention of a physician l be victims of emotional as well as physical trauma. ce there will not be enough psychiatrists to meet the d, every physician must learn some of the skills and hniques required to calm the fears of these patients. h emotional states are not complicated. They arise m a known cause;[4a] they are of short duration and are mmon to many patients; they can be dealt with simply d directly. The physician will often be treating patients om he knows; or the patients will know of the physi- n, and he will be completely acceptable to them. The physician can assure the patient that he knows how to treat the injuries. He can explain to the patient the necessity of his accepting some of the new and strange experiences he may have in being treated along with large numbers of others. Our job can be described as the prevention and direct treatment of fear.

It will be important that serious emotional disturbances be detected and that the patients affected be directed to some center where they can be observed and treated by psychiatrists. This must be done skillfully in order that the procedure of arranging for better care does not add additional emotional trauma. Such patients must not be labeled as different, nor should they be sent to mental hospitals until it is determined that they need such serious and extensive treatment. Most of this group—and from the English experience in World War II it will be a relatively small group[4a]—will probably respond to simple treatment by skilled psychiatrists.

Teaching the practitioner the simple techniques of psychological first aid is very important.[4b] It will not be easy. There has been considerable experience in postgraduate courses lasting one to three weeks. The subject will have to be reduced to its simplest elements and prepared in a palatable form. It will have to be presented in about an hour's time. The Civil Defense Committee of the American Psychiatric Association is preparing a suitable primer for the Federal Civil Defense Administration.

PREVENTION OF PANIC

Group panic and other mass disruptive reactions present a problem that awaits further study.[4c, d] The role of the physician in the prevention of poor group behavior is not clear, nor have general plans of education or training to prevent or control it been formulated. Poor group behavior in time of stress must be studied. Such behavior may be due to alarm reactions to either true or false reports or rumors. It may vary from staying away from work, due to changes in motivation, to war panic, mob hysteria, and the like; or there may be public apathy, lack of concern, and other evidences of repressed emotion. The need for studies is recognized by every responsible group in the field of mental health and in the Departments of Defense.[4] Well-planned studies are under way and more are being projected. To realize how important these studies are, one has only to recall the panic that resulted from Orson Wells's radio broadcast, "The Invasion from Mars," and the chaos and poor group behavior in the Texas City explosion, as well as many other historic instances of panic.

Until these studies result in a planned program, we physicians will have to rely on known aids to emotional security. A brief listing would include (1) information about the nature of the special weapons of warfare, calling attention to their limitations and to the protection afforded by the type of construction of our buildings as contrasted with that of the Japanese buildings; (2) knowledge of and understanding of the plans made to care for people; (3) emphasis on the importance of everyone having a job to do and the contribution of that job to the total effectiveness of our protection; (4) strong leadership that inspires confidence; (5) adequate welfare plans; (6) mutual aid plans (surrounding communities coming to the aid of a damaged community) understood by everyone; and (7) local mental health programs. We must realize that we are being subjected to psychological warfare, and we must learn to identify it.

(*b*) An Introduction to the Psychiatric Aspects of Civil Defense, Committee on Cooperation with Governmental Agencies of the Group for the Advancement of Psychiatry, Report No. 19. This excellent study with a bibliography is available to any professional person on request of two or more copies at 10 cents each from Group for Advancement of Psychiatry, 3617 West Sixth Ave., Topeka, Kan. (*c*) Caldwell, J. M.; Ranson, S. W., and Sacks, J. G.: Group Panic and Other Mass Disruptive Reactions, U. S. Armed Forces M. J. 2:541-567 (April) 1951. (*d*) Cameron, D. C.: Psychiatric Implications of Civil Defense, Am. J. Psychiat. 106:587-593 (Feb.) 1950.

Although it is more important to prevent group disruptive behavior, plans must also be made to interrupt it in its early development when it does occur and modify its course. So far, no program other than ordinary police function has been proposed. It may be possible to have what might be described as an intelligence service, in which competent observers widely scattered through our society would be alert to unusual group behavior or stories that might be the beginnings of serious rumors. They could report these to a selected group of citizens made up of social scientists, personnel directors, psychiatrists, and others who deal with groups, such as teachers. This selected group, in conference, would be in a position to advise what course should be taken and could work in an advisory capacity with police. It does seem that we should plan as intelligently as possible in facing these problems so vitally concerned with a healthy society.

SUMMARY AND CONCLUSION

Military combat is only one of the methods of warfare of our enemy. The others are political, economic, and psychological. Civil defense means more than an organization to treat injured or "pick up the pieces." It means n organized, intelligent effort to make our nation strong to meet any danger or attack. The public's major interest in civil defense is in the health and welfare division. The people expect us to be the leaders in health and welfare. We have never had a greater challenge to assume leadership as an organized profession or as individual citizens. We must train ourselves to do the job that is expected of us. With preparation, we have in our relationship with patients and as community leaders the opportunity to be a major force in building strength and courage needed for survival as a nation.

4105 Live Oak St.

Cancer Research.—It has become popular to decry the progress which has been made in the cancer field and to deprecate the possibility of advance in the future. Were history not so full of similar melancholy statements made regarding other disorders at times when irrefutable evidence to the contrary was at hand, the present cries of alarm might give concern. True, the problem is a difficult one, and the techniques complex. Recall, however, that most work on cancer has been on a random basis and so has included a broad study of natural phenomena relating to growth in general. This has restricted studies designed specifically to attain chemical control of the disease. In spite of the fact that substantial funds for cancer work have been available only since 1945, and that only a small part of them has been allotted to therapeutic studies, the progress has been gratifying indeed.—Cornelius P. Rhoads, M.D., The Experimental Method and the Cancer Problem, *Bulletin of the New York Academy of Medicine*, October, 1951.

COUNCIL ON PHARMAC
AND CHEMISTI

REPORT OF THE COUNCIL

The Council has authorized publication of the f
report.

R. T. Stormont, M.D., *Secr*

MISAPPROPRIATION OF SCIENTIFIC TERMINOLOGY FOR DRUGS

Generic (nonprotected) names for drugs are of scien
portance to all investigators and physicians. More gener
of established scientific drug terminology in prescriptio
lications, and speeches obviates confusion and constitut
toward simplification of world-wide nomenclature fo
peutic agents.

One of the obstacles which hinders universal employ
nonprotected drug terminology is the practice of traden
istration of generic names (or their near equivalent) ou
legal jurisdiction of the country of origin. This prev
free use of generally recognized nonprotected termin
the country which permits trademark registration of suc
Information available to the Council indicates that this
is often followed in various countries by pharmaceutic
facturers who either do not realize the universal impo
scientific terminology for drugs or are motivated chiefly
merical interest. The extent of this is revealed by the
partial list of names registered, or applied for regist
various foreign countries. These names are identical to
closely resemble, the nonprotected terminology adopt
United States:

aminophyllin(e)
antitoxon (antitoxin)
ascorbic (acid)
bacitracin
cortisone
estradiol
foliacid (folic acid)
heparine (heparin)

hexylresorcinol
histamin(e)
neostigmin(e)
penicillan (penicillin)
procain(e)
progestone (progesterone
sulfacetamide
testosteron(e)

The Council wishes to bring this matter to the attent
pharmaceutical firms, appropriate government agen
scientific groups throughout the world. It is hoped th
of generic names for drugs, irrespective of the country
eventually may be outlawed in the interests of univer
tific cooperation. Legal immunity provided by the limit
diction among countries does not justify usurpation of
names recognized elsewhere. The generic status of r
ture formally adopted by recognized scientific group
country should be universally respected by pharmaceuti
facturers.

The Council issues this statement with the warning th
of scientific terminology for drugs is highly detrimen
dissemination of knowledge concerning drugs and ther

NEW AND NONOFFICIAL REMEDIES

Hyaluronidase.—Alidase (Searle).—Wydase (Wyeth).

Hyaluronidase is an enzyme or enzyme-complex
capable of hydrolyzing the mucopolysaccharide, hyalur
It can be isolated from various bacterial cultures or a
sues. The activity of the enzyme is usually determined
measuring the reduction in turbidity which hyaluroni
duces when it acts on a substrate containing native hy
and certain proteins, or by measuring the reduction in
which hyaluronidase produces on a buffered solution c

potassium hyaluronate. At present, each manufacturer defines product in terms of turbidity or viscosity units, depending the system of standardization used. These units are not equiva- since they are measures of different properties of the enzyme.

ctions and Uses.—Hyaluronic acid, an essential component the "ground substance" of tissues, limits the spread of fluids other extracellular material. Since hyaluronidase destroys ue hyaluronic acid, injected fluids or other material tend to ad further and faster than normal when administered in junction with this enzyme.

Iyaluronidase may be used to increase the spread, and con- uently the absorption, of hypodermoclysis solutions; to dif- local anesthetics at the site of injection, particularly in nerve k anesthesia; and to increase the diffusion and absorption of r injected materials such as penicillin.

Iyaluronidase also enhances local anesthesia in surgery of eye. It is useful when administered as a cone injection in ıcoma, since it causes a temporary drop in intraocular ssure.

Iyaluronidase is practically nontoxic, but caution must be l in administering it to patients with infections. The enzyme cause local infections to spread through the same mechan- by which the spread of injected solutions is facilitated. *Until her evidence is available, hyaluronidase should not be in- ed into or about an infected area.*

ensitivity to hyaluronidase occurs infrequently. It can be dis- ered by testing the skin in the usual manner.

osage.—Hyaluronidase is supplied in dried form because it riorates on standing in solution. The extemporaneously pre- d solutions for injection should contain 150 turbidity units 500 viscosity units dissolved in 1 cc. of isotonic sodium ride solution or, with the appropriate amount of that salt, istilled water. This solution is added to each 1,000 cc. of odermoclysis fluid or injected at the site to be employed nediately prior to instituting the clysis. Special care is ad- ble in pediatric patients to control the speed and total volume fluid administered to avoid over-hydration; in children less n 3 years of age the volume of a single clysis should be limited 00 cc.; in premature infants and during the neonatal period, daily dosage should not exceed a volume of 25 cc. per gram of body weight; the rate of administration should not eed 2 cc. per minute. In adults the rate and volume of ad- istration should not exceed that employed for intravenous sion.

he agent also is used for addition to drug preparations or small amounts of anesthetic solutions for subcutaneous in- ion. For nerve block or infiltration requiring larger amounts anesthetic solution, 150 turbidity units or 500 viscosity units l 0.5 cc. of epinephrine hydrochloride 1:1,000 are added to h 50 cc. of solution and injected intracutaneously, subcutane- ly, or intramuscularly.

or local anesthesia of the eye, 150 turbidity units or 500 cosity units are dissolved in 1 cc. of a 2% procaine hydro- oride solution (or equivalent amount of other anesthetic to used) and 0.4% potassium sulfate. For nerve block, 0.4 cc. this mixture is diluted to 10 cc. and 0.12 cc. (two drops) of nephrine hydrochloride 1:1,000 is added prior to injection. r cone injection, twice as much epinephrine may be used.

Alidase (Dried): Ampuls containing 500 viscosity units of wdered hyaluronidase and 9 mg. of sodium chloride. G. D. arle & Company, Chicago.

Lyophilized Wydase: Vials containing 150 or 1,500 turbidity- lucing units of powdered hyaluronidase. Preserved with 0.01 d 0.2 mg. of thimerosal, respectively. Wyeth, Inc., Phila- lphia.

citracin (See New and Nonofficial Remedies 1951, p. 43).

Ointment Bacitracin: 14 gm., 28 gm., and 112 gm. tubes. An tment containing 500 units of bacitracin in each gram. Eli lly & Company, Indianapolis.

Ophthalmic Ointment Bacitracin: 7 gm. tubes. An ointment ntaining 500 units of bacitracin in each gram. Eli Lilly & mpany, Indianapolis.

Solvets Bacitracin: 2,500 units. Eli Lilly & Company, dianapolis.

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

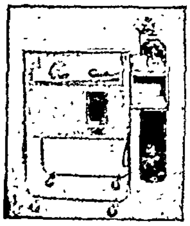
The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports.

Ralph E. De Forest, M.D., *Secretary.*

BABY'S HAVEN, MODEL NB5, MULTIPURPOSE INFANT UNIT ACCEPTED

Manufacturer: *Modern Hospital Equipment, Inc., 113 S. 10th St., Minneapolis 3.*

The Baby's Haven, Model NB5, Multipurpose Infant Unit is a device for housing normal or premature infants, administering oxygen therapy to infants, or isolating infants with contagious diseases. It is provided with casters so that it can be moved about on the floor, has a transparent front so that the infant can be watched from some distance, and has connections for oxygen and electricity. It stands 117 cm. high (46½ in.); the other dimensions are 50 and 30 cm. (31½ and 19¾ in.). It weighs 48 kg. (106 lb.). Prepared for shipment it measures 117 by 86 by 55 cm. (46 by 34 by 21½ in.) and weighs 57 kg. (125 lb.). The foreign shipping weight is the same, and the shipping weights include one sleeping mattress. Accessories not included in the shipping weights are a linen and sanitary supply compartment and an oxygen tank holder. The apparatus requires a supply of 60-cycle alternating current of 115 volts for operation, and draws 330 watts of power.



Baby's Haven, Model NB5, Multipurpose Infant Unit.

From acceptable sources the Council obtained evidence that this device was well constructed and that its performance was as represented by the manufacturer. The Council on Physical Medicine and Rehabilitation voted to include the Baby's Haven, Model NB5, Multipurpose Infant Unit in its list of accepted devices.

KENNIT ELASTIC HOSIERY ACCEPTED

Manufacturer: James R. Kendrick Company, Inc., 6139 Germantown Ave., Philadelphia 44.

Kennit Elastic Hosiery is intended to be worn by patients who need restraining pressure on the surface of the legs, from the metatarsal region to the level just below or just above the knee, particularly in circulatory disorders such as varicose veins. What is described as a two-way stretch is obtained by means of covered elastic yarn reinforced with mercerized cotton. The heel is closed in order to combat swelling in that area. The stocking is made in three styles. *Style K-1* is a garter-type with an open toe and elastic top which comes to below the knee. *Style K-2* is similar in style but has a soft top, from below the knee to the mid-thigh. It is kept in place by the garter from the girdle. *Style K-3* is similarly styled, but the elastic support extends above the knee, and it has a soft top for attachment to the girdle. A single elastic hem at the toe prevents the pressure of a double thickness. All styles are shaped for the average leg, and come in four sizes.

Kennit Elastic Hosiery

The Council obtained, from qualified sources, evidence indicating that these stockings were satisfactory both when tested under laboratory conditions and when worn by patients in clinical trials. The Council on Physical Medicine and Rehabilitation voted to include the Kennit Elastic Hosiery, Styles K-1, K-2, and K-3, in its list of accepted devices.

THE LOS ANGELES MEETING

The Fifth Annual Clinical Session of the American Medical Association, held in Los Angeles, Dec. 4-7, was an outstanding success in attendance and in interest in the program. The attendance exceeded that of any of the previous Clinical Sessions. The number of physicians who had registered by the final day of the meeting was over 4,400. Swelling this attendance were more than 4,600 guests, including residents, interns, medical students, nurses, and technicians. While the program had been carefully arranged to provide special interest for general practitioners, there was a sufficient variety of subjects and activities to appeal to others than physicians. The scientific and technical exhibitors were pleased with the attendance and interest shown by those who attended the meeting.

There were clinical demonstrations and lectures on more than 300 subjects, a scientific exhibit of 90 or more displays and demonstrations, and motion pictures and television embracing many topics. Medical and television history was made when the first colored television was shown on a coast-to-coast hook-up. Originating in Los Angeles, this demonstration was seen by medical audiences in this city and simultaneously in Chicago and New York. While the possibilities of television for teaching have long been discussed by physicians interested in visual education, no transcontinental arrangement of colored television had ever been attempted before. The results demonstrate beyond question the potential value of this medium for education.

A résumé of the proceedings of the House of Delegates and other important events at the Los Angeles meeting will appear in the December 22nd issue of THE JOURNAL. And in this and subsequent issues will appear some of the papers presented at scientific, public relations, and other meetings. An earlier issue of THE JOURNAL published the scientific program, which, along with the exhibits offered by 150 manufacturers of equipment, pharmaceutical, and food products, and by book publishers, created the popularity of papers, demonstrations, and exhibits.

The scientific program at clinical sessions is not organized into scientific sections as it is at a regular annual meeting; nevertheless at Los Angeles numerous sessions were devoted primarily to pediatrics, dermatology, diseases of the chest, cardiovascular diseases, obstetrics and gynecology, general surgery, general practice, urology, industrial medicine and surgery, eye, ear, nose and throat, radiology, anesthesia and pathology, traumatology as related to civilian defense, and medical blood banks. Other sessions included general lectures of in
est to all physicians, which were presented by wid
known speakers.

Among the special features of the scientific exhibit w
an exhibit symposium on overweight, nutrition, a
health, which was followed by a question and ans
period. The five exhibits on this subject were conti
ously demonstrated throughout the week. There wa
special exhibit on fractures, at which treatment
stressed by demonstrators, which was also held conti
ously throughout the week. In addition, there could
found mannequin demonstrations on birth problems
an exhibit symposium on noise and health. The ne
adopted method of artificial respiration, which was
cussed in detail in THE JOURNAL, Dec. 8, page 1444,
demonstrated by the authors and attracted much at
tion.

Among the actions taken by the Board of Trustees
an appropriation of another half million dollars to
American Medical Education Foundation, which
been raising funds within the medical profession du
the last year for the nation's medical schools. The f
dation was founded at the December, 1950, meetin
the American Medical Association in Clevelan
which time the Board of Trustees announced an ap
priation of a half million dollars as a nucleus fund
raised by the medical profession to assist medical sch
Since then, additional funds have been contribute
national, state, and local medical societies, indiv
physicians, and some nonmedical persons. A full
office for the foundation has been created and is lo
at the headquarters of the American Medical As
tion. This office is necessary to assure the attentio
the foundation deserves, but in no way causes a fin
drain on the funds collected, as the American M
Association is underwriting the total expenses in
in raising these funds. Thus, every dollar that is co
ted is allocated, with no loss for administration, to
ical schools.

Among the visitors to the House of Delegates
American Medical Association was Donald R. W
Clarksburg, W. Va., national commander of the
ican Legion. In an inspiring address he paid tribute
American physician and his determination to p
basic answers to the problems of medical care faci
people of this country. He warned that the medica
fession must be the watchdog of American healt
that the American people must look to it for lead
planning, and results. He said in part: "You may d
on us to carry our full share of what is primaril
battle. We shall do it not only for your good but a
the good of the American people. We see and unde
your problem and are prepared to render whateve
ice we can."

Some idea of the interest and appeal of this m
of the American Medical Association was reflected
coverage provided by newspaper and magazine w
This was the largest group of writers ever assigned
port on a Clinical Session of the American Medical
ciation. Los Angeles and other West Coast news
gave liberal amounts of space to physicians and t
ical achievements. In fact, one prominent civic
said on the last day of the meeting that he had neve
so much space devoted to one organization at an
in Los Angeles. This response by the press was ta
many observers as an indication of the increased
larity of the Clinical Session of the American M
Association.

ESISTANCE TO INSECTICIDES

Because of the great military and civilian importance the newer insecticides in the control of malaria, pedicosis, and other insect-borne and insect-caused diseases, is disturbing to note that an increasing number of sect species are becoming resistant to these compounds. a recent symposium[1] on the subject presented at the nual meeting of the National Malaria Society in Chigo, it was pointed out that in many parts of the world ains of the house fly, the mosquito, and the bed bug ve become resistant to a variety of insecticides and it most recently the body louse in Korea has become ghly resistant to DDT.[1a]

According to the investigators who participated in the mposium, the pattern of resistance is characteristic. It velops most readily in the domesticated, adaptable ecies and first appears after the insecticide has been use in a given area for one to five years.[1a] In the mosito it appears more rapidly when the larvae as well as adults are sprayed.[1b] Exposure to one compound may luce resistance not only to that compound but also related insecticides. Flies made resistant to DDT, for ample, show a cross resistance to methoxychlor, while ose made resistant to lindane, chlordane, or dieldrin o show resistance to the other two members of this oup.[1c] Once resistance to a single compound or group compounds develops in a strain, that strain tends to come resistant to other insecticides more rapidly. The use fly that requires 6 to 12 generations to develop sistance to DDT in the laboratory may then require ly one or two additional generations to develop resistce to other compounds.[1c] Strains that have become sistant do not usually revert to the nonresistant state ter withdrawal of the insecticide.[1a]

The mechanism of resistance in insects may be physiogic, anatomic, or behavioral.[1a] Slight metabolic differces in some strains may permit them to carry on vital nctions even in the presence of insecticides. Morphogic variations in others may prevent the lethal action these drugs, while peculiarities in behavior in still hers may have survival value. In a DDT-sprayed buildg, flies that tend to settle on horizontal, untreated rfaces survive in greater numbers than those that settle the vertical, sprayed walls. Likewise, flies that rest ietly on a treated wall have a greater chance for surval than those that move about continuously, since ey come in contact with less of the insecticide.

No satisfactory means of preventing the development resistance to insecticides is yet available. According to ess,[1a] it is useless to continue the search for new insecticides, since the same mechanisms that account for resistce to currently used preparations will probably be pable of producing resistance to any new compounds at are developed. He recommends an immediate return the older principles of sanitation in the management insect-borne diseases until fundamental research can ield more information on the mechanisms and prevenon of resistance. Chadwick,[1d] too, stresses the impornce of physiologic studies on the mode of action of secticides and the processes by which insects escape heir toxic effects. He feels that only by acquisition and ynthesis of this type of knowledge can we expect to revent future resistance to insecticides.

HYALURONIDASE AND VASCULAR PERMEABILITY

The ability of testicular extracts to increase the permeability of connective tissue was described independently by Hoffman and Duran-Reynals [1] and by McClean [2] in 1930. In 1939 Chain and Duthie [3] demonstrated that this "spreading factor" was due to a mucolytic enzyme, hyaluronidase. During the same year, Duran-Reynals [4] reported that testis extracts which increased tissue permeability also increased capillary permeability. At this time he suggested that the spreading factor might be responsible for both effects, but in a later review he referred to unpublished work that indicated a dissociation between the two activities.[5] Studies by other investigators have yielded conflicting results, some [6] supporting Duran-Reynals original suggestion and others [7] casting doubt on the identity of the capillary permeability factor and the spreading factor. Believing that the discrepant results were due to differences in the relative purity of the testis extracts, Benditt and his associates [8] compared the effect of highly purified preparations of hyaluronidase on vascular permeability in rats with two crude preparations of the enzyme, one of which served as the starting material for the more purified extracts. After the intravenous administration of Evans blue, rats received equivalent quantities of the various testis extracts, in terms of hyaluronidase activity. Thirty minutes later, the animals were examined for evidence of increased capillary permeability as manifested by grossly apparent edema and tissue coloration, increased hemoglobin concentration, and dye disappearance. Results indicated that the crudest preparation had vascular permeability-increasing activity while preparations of higher purity lacked this ability. This was also seen when comparable amounts in terms of hyaluronidase activity of crude and purified preparations were injected intracutaneously in rats after the intravenous administration of Evans blue. On the other hand, the purified hyaluronidase preparations retained their spreading activity as evidenced by observations on the spreading of india ink and Evans blue in the skin of rabbits and rats. Benditt and his associates are now endeavoring to purify and further characterize the vascular permeability-increasing factor shown by them to be independent of the hyaluronidase and spreading activities of testis extracts.

ANTERIOR PITUITARY AND HYPOTHALAMUS

A functional relationship between the hypothalamus and the neurohypophysis has been generally accepted since Ransom and his associates[1] showed that interruption of the supraoptic hypophysial tract leads to retrograde degeneration of the cells of the supraoptic and paraventricular nuclei, atrophy of the neurohypophysis, and diabetes insipidus. In contrast, the question as to whether the hypothalamus exerts control over the anterior lobe of the pituitary is still highly controversial. While it is generally agreed that few if any of the nerve fibers of the supraoptic hypophysial tract penetrate into the anterior lobe, some investigators feel that the hypothalamus exercises control over the anterior pituitary by liberating a humoral agent that is transmitted by the hypophysial portal blood supply.[2] Others, however, have questioned this concept, postulating that loss of anterior function following destruction of the portal system may be due to cellular destruction secondary to ischemia rather than to interruption of a neurovascular link between the hypothalamus and the pituitary.[3]

An entirely different approach to the question of relationship between anterior pituitary and hypothalamus has been offered by Bodian and Maren[4] with their presentation of evidence suggesting that the anterior pituitary exerts a trophic effect on the hypothalamic nuclei. These investigators studied two groups of rats subjected to partial hypophysectomy. In the first group, approximately half of the neurohypophysis was removed, as was the intermediate lobe. The anterior lobe, however, remained almost completely intact, and, while it appeared to be completely isolated from any possible connection with the hypothalamus, its function was apparently well preserved. In the second group, the greater part of the adenohypophysis was removed together with about half of the neurohypophysis. Some three months after operation, the animals were killed and the hypothalamic nuclei were examined histologically. In the first group of animals, it was found that the means of the number of cells in the supraoptic nucleus and the magnocellular part of the paraventricular nucleus were 34% and
37% of normal, respectively, while the correspon
figures for the second group were 24% and 15%. In b
nuclei, the differences between the two groups of anim
were found to be significant. There was thus an un
pectedly severe cell loss in hypophysial nuclei follow
partial neurohypophysectomy and total adenohypop
sectomy. The authors suggest that some of the cells h
ing end-arborizations in the neural lobe may also h
proximal collaterals in the hypothalamus and that re
grade degeneration of these cells may not follow dest
tion of the end-arborizations, provided the anterior l
function is adequate. Since no nervous connections
mained between hypothalamus and pituitary in the
ond group of animals, they suggest that this postul
trophic relationship between the hypophysial hypoth
mic nuclei and the anterior pituitary involves a hum
factor. As they point out, the crucial test of the rol
anterior lobe hormonal factors would be the effec
substitution therapy in preventing the additional cell
in hypophysial nuclei that appears to follow ant
lobe ablation.

THIRD NATIONAL CONFERENCE ON PHYSICIANS AND SCHOOLS

The Third National Conference on Physicians
Schools was held at the Moraine Hotel, Highland
Ill., Nov. 6-8, 1951. The conference was sponsore
the American Medical Association through its Bure
Health Education as the third in a series of confere
the first two of the same nature having been held in
and 1949.

State medical societies, state departments of educa
state departments of health, and national health
cies were invited by the American Medical Associ
to send delegates to the meeting. One hundred ei
three participants representing 129 agencies and or
zations came from 35 states, Hawaii, and the Distri
Columbia to attend the conference. Forty consultan
national reputation in the fields of public health, p
education and medicine served as discussion lea
Several foreign visitors on tour of the United State
tended as observers.

Five discussion groups considered specific aspec
health services for school age children. Every effort
made to include an equal representation from the va
agencies in each of these groups. Each group held
working sessions, during which specific recomme
tions on policies for school health work were formul
At general sessions, Dr. Ernest Howard, Assistant Se
tary and General Manager of the American Medical
sociation; Dr. Edwin S. Hamilton, American Medica
sociation, Board of Trustees; Clyde Parker, superint
ent, Cedar Rapids (Iowa) Public Schools; and Dr. W
Bauer, Bureau of Health Education American Me
Association, appeared as speakers or discussion lea
One general meeting was given over to reports descri
the school health activities of medical societies in sele
states. The concluding session was devoted to re
of the recorders, who summarized the recommenda
for the five discussion groups.

General interest in these biennial conferences on school health, as reflected in a steadily increasing attendance from all the agencies concerned, indicates the growing significance of the meetings to both the medical profession and the other groups concerned. Evidence of improved relationships and better understanding among educators, private physicians, and public health personnel were apparent not only in the accord achieved on school health policies and principles but also in the numerous requests that the national conferences be continued at two-year intervals and that efforts be made to encourage similar meetings at state and local levels.

The sponsoring of these national conferences is only one among a number of American Medical Association activities carried on to interpret to education and public health personnel the important role of the private physician in school health. For over 40 years the American Medical Association has had a Joint Committee on Health Problems in Education with the National Education Association. Its purpose is to provide a counseling group representative of the combined medical educational viewpoint to which the schools may turn for advice on health problems. The staff of the Bureau of Health Education at the American Medical Association also participates in numerous school health activities, including attendance at meetings and institutes, participation in the committee work of many agencies and associations, the preparation of articles, radio programs, and transcriptions on school health subjects, all of which are designed to aid in the development of sound programs of school health within the framework of the private practice of medicine.

While representation at the conference from state medical societies, state departments of education, and state departments of health was fairly well equalized, and more delegates from state medical societies attended than in previous years, there is still need for greater representation of the constituent state societies. In several instances, one person was designated to represent both the state medical society and the state health department. In one case, the state health commissioner represented all three of the state agencies. Such designations demonstrated fine relationships in the states concerned and are to be commended. However, at a conference sponsored by the American Medical Association with great emphasis given to the role of the private practitioner in school health services, it is imperative that the viewpoint of the physician in private practice be fairly presented. This can be accomplished only if each state medical society will make the strongest possible effort to assure the attendance of a practicing physician as its representative at future conferences. Only then can these meetings achieve the full purpose for which they are designed. The guidance and counsel of the practicing medical profession are needed if school health programs are to develop along sound lines. The National Conferences on Physicians and Schools furnish an unequaled opportunity to provide the needed leadership.

TWELFTH ANNUAL CONGRESS ON INDUSTRIAL HEALTH

The Twelfth Annual Congress on Industrial Health will be held Friday and Saturday, Jan. 18 and 19, 1952, at the William Penn Hotel in Pittsburgh. The Council on Industrial Health of the A.M.A., the Medical Society of the State of Pennsylvania, and the Allegheny County Medical Society will act as co-sponsors. The American Academy of Occupational Medicine is meeting at the same time and in the same place, and certain sessions will be jointly conducted. On Saturday, the Council on Industrial Health has asked for and received collaboration from the Woman's Auxiliary of the American Medical Association in a full-day presentation on the important place that the American housewife occupies in industrial production as homemaker and increasingly as participating worker.

These interrelations illustrate the pervasive influence of industrial health and of medical services to industrial workers. The congress programs have repeatedly called attention to the demands industry makes on almost every medical specialty for treatment, for prevention, or for conservation. In much the same way, programs or experiments in the provision of medical care for industrial groups or union members represent movements of tremendous vitality and interest. In consequence, the subject matter under discussion at these meetings cannot be confined solely to scientific matters but tends more and more to incorporate significant developments in the socioeconomic field.

The general theme of the sessions during the coming congress will be industrial health services as a significant factor in the whole health picture of individual workers, requiring planned integration with many other community health resources—the practicing medical profession, the official and voluntary health services, and organizations dealing with housing, nutrition, and recreation. The favorable effects of an industrial health service can frequently be discounted by unhygienic habits or conditions away from work, where most time is spent.

On Jan. 17, the day preceding the congress, the Council on Industrial Health meets jointly with representatives of the state medical society committees on industrial health. These sessions have been held for a number of years and have proved helpful in the interchange of ideas and experiences. The Commission on Industrial Health of the Medical Society of the State of Pennsylvania is presenting a full-day discussion of its experiences in meeting the industrial health problems of a great industrial commonwealth. As industrial physicians and private physicians meet on common ground and recognize the necessity for mutual aid and understanding, genuine cooperation usually develops. It is hoped that every industrial health committee will have representation there.

The program of the congress may be found elsewhere in this issue of The Journal. Those who plan to attend should make hotel reservations early.

ORGANIZATION SECTION

PROCEEDINGS OF MEETING OF HOUSE OF DELEGATES

Announcer: Good evening, ladies and gentlemen. Tonight you are part of a vast nation-wide audience, participating in an historic event with some 6,800 persons here in the great Shrine Auditorium in Los Angeles. In just a few minutes you will hear the broadcast of a great, nonpartisan forum bringing together two eminent United States Senators, representing our two major political parties, in a dramatic discussion of the day's great national issues. It is a real American audience that is waiting for this colorful drama to begin—people from all walks of life, civic leaders and housewives, motion picture stars and club women. In a special section down front, along with their wives and guests, are your hosts—members of the House of Delegates of the American Medical Association, meeting in its Fifth Annual Clinical Session here in Los Angeles. On the flag-draped stage are seated the officers of the American Medical Association and members of its Board of Trustees and Coordinating Committee. Seated with them are the two distinguished United States Senators who will speak to you tonight on the critical issues now facing the nation—Republican Senator Robert A. Taft of Ohio and Democratic Senator Harry F. Byrd of Virginia. Now the Speaker of the A. M. A. House of Delegates, Dr. F. F. Borzell, of Philadelphia, has raised his gavel to call the House to order. The next voice you hear will be that of Dr. Borzell.

Dr. Borzell: The House of Delegates of the American Medical Association will come to order. This eventful meeting of the House will proceed with the important business at hand. I now call upon the President of the American Medical Association, Dr. John W. Cline of San Francisco.

Dr. Cline: Mr. Speaker, Distinguished Guests, Members of the American Medical Association, and Fellow Americans:

This is not only a significant occasion in the annals of the American Medical Association, but it is also a memorable occasion in the political and economic life of the entire nation. Tonight we shall hear from two of the most able and highly respected representatives of this country's major political parties. It is fitting that the American Medical Association should provide a forum for these distinguished Americans.

Our Association is a large, nonpartisan, professional organization, representing a wide cross section of American thinking. Our membership includes approximately an equal number of Democrats and Republicans. During the past three years our fight against socialized medicine has been conducted on a nonpartisan basis, and, because of that, we have won overwhelming, nonpartisan support from members of both parties and from all segments of the American public.

In that same spirit we gather here tonight, with a feeling of concern over the vital issues which confront our country, not as they might affect the temporary fortunes of either political party, but as they will influence the entire future of this great nation. And here tonight we soon shall have the privilege of listening to a highly significant preview of the major issues in The Great Debate of 1952.

Each of our distinguished guests is completely free to say what he thinks on both domestic and international issues, but, knowing the character of these men, I am confident each of them will make his views clear on what we believe to be the key issue in America today—freedom versus socialism.

The first of our two speakers represents the Republican Party. In fact, he often is called "Mr. Republican," which in itself is a tribute to his stature in the affairs of our nation. He is a member of one of this country's best-known and most illustrious families. His father was the 27th President of the United States, and there are many who feel the son may follow in his father's footsteps.

A lawyer by profession, he has served in public life mos the time since 1917, when, during the first world war, he bec an assistant counsel for the United States Food Administrat Later, for several years, he was first a Representative and t a Senator in the Legislature of his home state of Ohio. S 1939 he has been one of the nation's most conscientious lea in the United States Senate, and he was re-elected last yea one of the most dramatic and decisive election contests of

His political adversaries, as well as his friends, agree tha is a man of high intellectual attainments, great moral cou and political integrity. He is, today, a leading contender nomination as the Republican candidate for President of United States.

Ladies and Gentlemen, I am pleased to introduce the se Senator from Ohio—the Honorable Robert A. Taft.

Senator Taft: The American Medical Association is on the leaders in the battle of liberty against socialism. I appre the opportunity they give me tonight to discuss that issue wit people of the United States. The fundamental problem be the American people today is how best to maintain the progress they have made under liberty, and pursue their de to higher spiritual and material goals. That liberty is threat by the forces of communism from abroad. It is threatened b growing socialism and government control at home.

Liberty has been the key to our progress in the past, and the key to our progress in the future. I do not underestimat value of democracy, a government by the people, but to me peculiarly valuable because it is more likely than any other of government to assure liberty. But even under democ liberty may be destroyed if the people become arbitrary rule give arbitrary power to their representatives. Then liberty disappear while the form of democracy remains. It is the merit of the American form of government that it under to protect the liberty of minorities even against an autoc majority of the people themselves.

What do I mean by liberty?

I don't like the term "free enterprise" because it seems to only the liberty of business, which is a small element. Li means your right and the right of every man to live his ow and think his own thoughts; to have those thoughts taugh others if you can find men who believe in them. Liberty is right to spend the proceeds of your labor in such a way as want to spend them, with only a reasonable deduction for necessary costs of government. It means the liberty of local government: the right of every community to decide on its institutions, how its children shall be educated, what local ices shall be rendered and how, the form of local governm all without direction by some federal bureau in Washington right of states to run their own affairs. Liberty includes right to choose your own occupation and run your own pro sional activities or business or farm as you see fit to run it, ex for such control as may be necessary to assure a similar dom to others.

The results of liberty in the United States, where it has a longer sway than in any other nation, has been a constant provement in ideas and research and methods in every fiel intellectual activity, in science, in welfare, and in knowledg has trained people to think for themselves and cultivate reliance. American armies have been the best armies in the w not because of better discipline, but because the American sol has met each problem by thinking for himself. The Ameri system, by offering incentive and reward and liberty, has stea increased the productivity of the American workman and American farmer, and, because the more goods are produ per person the more there is to divide up per person, his sta ards of living, your standards of living. It is not so much that or I are free and enjoy being free. It is that millions of Americ are free, and the competition of their ideas causes the best i to rise to the surface and finally prevail. Our business syster

---

Transactions of an evening meeting of the House of Delegates at Los Angeles, Dec. 5, 1951, broadcast over a nation-wide hook-up of the American Broadcasting Company.

such that any man can have an idea, but also can have the idea tried out without getting the approval of some government clerk.

The man who has profited most from this liberty has been the man of low income. The wages paid in this country are more than twice those paid in Great Britain, and the average American worker has twice as much of all the things that make life worth while—of good homes and home equipment, automobiles, recreation and opportunities in every field of life.

This liberty is threatened today by what is roughly called socialism. By that I mean the growing power of government in the affairs of all of you individuals, and its increased activity in many fields where it has never heretofore been involved. Socialism is a matter of degree, because some fields of activity must be and some have been always conducted by goverment, notably the post office and public schools and public roads, but for many years the proportion of government activity was more or, less static. In 1931, for instance, the federal government conducted 5 per cent of the country's activity and collected 6 per cent of your income in taxation to do it with. The state and local governments took about the same amount, or a total of 12 per cent. In 1949, before this mobilization program started, the government was already spending 10 times as much money as it spent in 1931, and had moved up to 18 per cent of all our activity plus 7 per cent more for state and local government, or more than 25 per cent of all the activity of our nation. The share of government had more than doubled. By 1953 the government will be spending 38 per cent of the total income. In Great Britain the government takes about 40 per cent.

The federal government has gone into many businesses for tself, and threatens to go into more. It has undertaken to regulate all industry and commerce and agriculture with great federal bureaus and huge subsidies. It has taken over functions which were almost exclusively local, and it threatens to take over all welfare services through a scheme known as social insurance which is not insurance, but simply more taxation to support free federal welfare services.

The American Medical Association has taken the lead in opposing this trend, and the doctors are justified in this because the key move of the socialists today is the effort to set up a federal system of socialized medicine. The government proposes to collect 6 or 7 billion dollars, mostly in payroll taxes from workmen, and set up a vast federal bureau to employ nearly all the doctors n the country to furnish free medical service to all the people, ncluding the great majority who are perfectly able to pay for it hemselves. The program, of course, would supersede all our private, state, and local activity in furnishing medical care. It would destroy the independence of the American medical profession, which is responsible for more improvements in health care and remedies for disease than any profession in the history of the world. It would bring the federal government's agents into every home more than any other service could possibly do. If the service is like most federal services, or like that of Great Britain, it would be pretty poor service.

But medicine is only the opening wedge. In Great Britain the government furnishes free service for the birth of babies, for the support of children, for burial at death, and for every misfortune of life. That is the goal of our Federal Security Administration as set forth in several of its annual reports. More government regulation also faces us in peacetime price control and wage control and rent control and agricultural control, until, as in England, the government will tell every man how he must run his business, when he can expand or not expand, what machinery he can buy, and what wages he can pay. In agriculture the proposals would soon lead, as they have in England, to the government telling every farmer what he can raise and what he can't raise, how many beef cattle he can feed, how many dairy cattle he can keep, how many hogs and chickens he can raise.

What is the purpose of this vast expansion of government activity? Supposedly it is for the welfare of the man of low and middle income, but they have all this in England, and the British workman gets wages equal to about 40 per cent of what the American workman gets, and has less than half the standard of living. He is just as good a workman. His trouble is that there has not been in England, either in business or in government, or in labor, the freedom which has existed here.

Socialism draws a beautiful blueprint, but it utterly destroys the incentive of the individual manufacturer or the individual workman. In its effort for equality, it reduces everyone to the dead level of mediocrity. New ideas are discouraged. It moves toward its goal of complete equality, but the lower income American workman is better off than the average man in a socialist country. If we took everybody's income over 10 thousand dollars a year and distributed the excess to the other workers, there would be less than 2 per cent improvement in their wages; and that wouldn't last, because no one would go on working to earn over 10 thousand dollars a year if taxation was going to take it all. But a free system has resulted in a steady increase of productivity at the rate of 3 to 4 per cent every year, reflected in constantly increasing wages and standards of living. It is the low and middle income workers who profit most from liberty.

If socialism takes 40 per cent of the income of the country, in the long run it takes from 25 to 40 per cent of your income. Socialism is expensive. It causes tremendous taxation. A lot of those taxes are passed on into the cost of goods which you buy. Even the man of lowest income today already pays 20 per cent of his income in taxes, either directly or in the increased price of every article that he buys.

You are thus deprived of the liberty of spending the money that you have earned. The government spends it for you. If the present increase goes on, the time will come when the government takes 75 per cent of your income. Then you will be like the little boy in boarding school with some spending money in your pocket, but the government, like the school master, will tell you when to get up, what to eat, what to do and when to go to bed. It is just as easy to get complete socialism by more spending as it is by government directly taking over one business after another.

This whole danger has come upon us gradually. Each project is presented as something to improve somebody's condition without consideration of its effect on his freedom and that of others. The more powerful the government becomes, the stronger its propaganda in behalf of more power. The trend cannot be stopped, unless you are willing to elect both a President and a Congress who believe that the maintenance of liberty is the first and most essential consideration for progress.

But those who dwell on the importance of liberty must recognize the proper functions of government, and their case is weakened unless they recognize that there are necessary limitations even on liberty. What we seek is liberty for all the people, not for any special group. In a great complicated industrial community, liberty cannot become laissez faire. There cannot be a negative government action in its proper field or even some increase to meet new problems.

1. Government action may be necessary to maintain a limited liberty for all in our complicated modern life. We have more red and green lights at our corners to prevent confusion in traffic and other regulations so no one can hog the road. We have a Federal Communications Commission to prevent utter confusion on the air waves in radio and television. We have a Civil Aeronautics control because we desire safety in the air. But, in all of these necessary regulations, the important thing is that they be undertaken so as to preserve the utmost liberty possible in highway and air traffic, radio, television, and the like.

2. We have found that some government regulation is necessary if we are going to retain liberty itself in business. Thus, we found that without any government regulation, we were likely to have monopoly in many fields of business. Without the Sherman Act there would have been no freedom to go into, or, stay in, business. Probably our industrial progress is due as much to protecting commercial freedom as any other factor. We see the vivid contrast in the stagnation of industry produced by the cartel system abroad. Thus, also, a free market is only possible if some protection is given against economic oppression and manipulation. We have enforced collective bargaining so that the fixing of wages may be on a truly free basis, as against the condition where an employer dealing with thousands of employees individually had an undue advantage in fixing wages. We also protect cooperatives in the farm field so that the individual farmer may not lose his economic freedom to obtain a fair price for his crops, because he is such a small unit dealing with a larger buyer or a market dominated by buyers. But in all of this legislation the important thing is to realize that the purpose is to protect liberty and a free price and wage determination for the greatest possible number of people, and not to carry out

some ideal economic control and direction of wages and prices and production conceived by a socialist planner.

3. Government certainly has the obligation in this country to relieve hardship and distress where private charity cannot do it. The advantage of our system is that it assures, roughly, a return in money measured by the work done and services performed, and thereby gives the incentive to do more and better work and more and better thinking. But under that system many must fall behind because of misfortune or their own lack of ability. Socialism claims that its advantage is in treating all equally. That is an ideal it has never attained, but it has destroyed incentive to improve. But the American people are charitable people, and they feel that this country is so productive that perhaps for the first time in history they can abolish hardship and distress from economic causes. Also our Constitution has as one of its ideals equality of opportunity, and the American people have come to feel that every child should have something like equality of opportunity no matter how poor the family or the community into which he may be born. Our state and local governments have always offered free primary and secondary school education in this country. They have undertaken to provide relief and old age assistance. They have given free medical care to those unable to pay for it. Practically every city has a general hospital for that purpose, and, while there may be gaps in service that could be closed, we do have throughout our country as good medical care available for the unfortunate as any country in the world. Our local governments, with federal aid, have undertaken to provide free housing for those unable to pay enough rent for decent private houses.

I quite agree that when you get in this field on an extensive basis you have to be careful not to go on to socialistic service for all. In fact in free schools and in the old age and survivors insurance system we have taken two steps into socialism; but I do not think that term can be applied to the charitable effort to remove extreme hardship and distress.

If we don't want charity to develop into socialism, however, there are certain definite rules to be followed. First, there must be state and local control, and the service must under no circumstance be federalized. I do not think you can maintain freedom in a country of our size in any field ruled by federal bureaus. They are too far from the people. They are so far from the people that they can't determine who is in need and who isn't, as we saw in W. P. A. days, and their policy becomes one of hand-outs for all. They are in no way responsive to public opinion. They make no allowances for the local differences of physical condition or custom or taste. The federal government may reasonably furnish advice and research. In clear cases of need, it may furnish assistance, but it should never control or regulate. For this reason, if there is any federal aid, it must be dispensed on definite statutory rules, with minimum discretion in federal officials. We have found that, if such discretion is given, it leads to an effort to withhold money until the state or locality complies with the ideas of some Washington bureaucrat has to how the service must be conducted.

State and local government services seeking federal aid must not only be confined to those in real need, but the standard of need must be a minimum one which does not make the recipient of government money better off than the man who works for a living. After all, to the extent that government supports those who are not working or not carrying their share of the burden, it can only do so by imposing more taxes on all the people who are working. It is an illusion to think that you can get this money out of corporations or the rich. If you confiscated all income over 10 thousand dollars a year per person, you would get 3 billion dollars more than today. Socialized medicine alone will cost from 6 to 10 billion minimum. The way costs are going today, it might even reach 18 or 20 billion. We cannot impose on the hard-working people of this country a burden so great to support the nonworkers that it reduces their incentive and their standards of living.

With the tremendous military spending we now face, I doubt if we should undertake any additional program, no matter how meritorious. My own feeling is that we endanger the whole economy of this country if we permit the total tax burden to run over 25 per cent of the income of all the people. Where it has reached 40 per cent, there is no longer any incentive for private development, and little doubt that socialism will conti
spiral upwards.

But whatever government project may be justified, it i
that those who enact it, and those who administer it, ha
stantly before their eyes the maintenance of the greatest p
liberty for the greatest number of people. The justificati
any government action must be clear and beyond questio

of human liberty are eternal.

ANNOUNCER: You have just heard Senator Robert
speaking before a meeting of the House of Delegates
American Medical Association in Los Angeles. In jus
minutes you will hear the second noted speaker of this
—a Democrat, Senator Harry F. Byrd. We pause now for
identification.

We are back in Los Angeles, where Dr. John W. Cline
dent of the American Medical Association, is about to in
Senator Byrd. The next voice you hear will be that of Dr

DR. CLINE: Thank you, Senator Taft, for that excelle
entation of your views on the major issues in America
The doctors of this country are deeply grateful to you,
millions of other citizens in all fields of endeavor, for you
ageous fight for American principles. And now, what w
next speaker, as a distinguished representative of the Dem
Party, have to say? Will he agree or will he differ w
Republican speaker? Will their opinions conflict, or wi
coincide on the fundamental questions confronting our co
We soon shall hear.

Our second speaker—a successful farmer, fruit grower,
paper publisher, and public servant—is a life-long De
from the traditionally Democratic state of Virginia. He
his public career with 10 years of service as a state senat
was a leader in establishing Virginia's highway system. Fo
years he was chairman of his state Democratic Committe
for another four years he was governor of the great st
Virginia. He was for 12 years the Democratic nationa
mitteeman from his home state. In 1933, he was appoin
fill an unexpired term as United States Senator, and the
cessively, in 1934, 1940, and 1946, he was elected and re-
for three full terms in the Senate.

He has gained nation-wide recognition and honor as a fightng apostle of economy, efficiency, and integrity in government. He believes, with all his heart, in the American way of life, and he repeatedly has warned that this country can be taxed into tate socialism, even more easily than it can be legislated into hat status. He has not indicated that he is a candidate for the Democratic nomination for President, nor has he campaigned or that high office. It is an index of the esteem in which he is held by the American people, however, that in a recent poll of nonmetropolitan newspaper publishers, on the question: "Whom do you believe to be best qualified for the Presidential nominaion by the Democratic Party," he ranked only two votes short f first place in this nation-wide survey.

Ladies and Gentlemen, I now have the pleasure of introducng the senior Senator from Virginia, the Honorable Harry F. Byrd.

SENATOR BYRD: It is a privilege to address the American Medical Association. I am very happy to be in California and in his great city. I have a high respect and friendship for your two senators, Knowland and Nixon. They are able, patriotic and inuential. As a Democrat to two Republican colleagues, I am glad to pay this tribute. I am told that the rules of this meeting prohibit a "partisan" approach. I submit that I can qualify as nonpartisan, and my record proves it.

Even I, a Democrat from Virginia, have been charged, in hese days of stress, with voting with the Republicans. We have many statisticians in the government at Washington. How they mploy their time, I do not know, but they get out reports every now and then, and frequently on the Senators. They say that I oted 66% with the Republicans and 34% with the Democrats. My answer to that is this: My name begins with a "B." As the oll is called alphabetically, I vote first, and the Republicans ote with me.

I can say with all sincerity that when these great legislative sues come before the Senate of the United States, the test I pply is not whether they are of Democratic origin, or of Republican origin, but whether they are best for the United States f America. I make no apologies for standing shoulder to houlder with that Republican leader, Senator Taft, when the ffort was made to repeal the Taft-Hartley Act. I believe the epeal of that Act, demanded by President Truman in order to ay a debt he had assumed in the campaign of 1948, would have been the green light to labor leaders to do what they pleased n this country—stop our trains, stop our mines, stop the very ecessities of our existence—unless we yielded to their demands.

It was not entirely the question of the language and the conents of the Taft-Hartley Act. The issue was whether certain labor leaders were to be permitted to force the repeal of a law hat had been passed overwhelmingly by the Congress of the United States. And, I am proud of the fact that I was one of ixteen Southern Democratic Senators who voted with the Republicans. This act remains on the statute books because of the willingness of the Southern Democrats to place country above party. We Southerners are sometimes criticized, but every now and then we perform a useful purpose. I think we did in that nstance.

What kind of a Democrat am I? I am a Jeffersonian Democrat of the old school who believes that simple honesty is still the very foundation of human character. I am an antisocialist Democrat, which means, in plain language, I am *not* a Truman Democrat.

The essence of freedom, under our American democracy, lies in our system of checks and balances. Within the federal government, checks and balances are provided through a three-branch system—the executive, the legislative and the judicial. Beyond this, still other checks and balances are provided in our system of state and local governments, which lie closest to individual citizens from whom all governmental power and authority is derived. Our democracy has been given vitality by our system of competitive free enterprise, which, to this point, has made us, through individual initiative, the greatest nation on earth. I stand for this system, with the absolute minimum of governmental shackles. Our four foundation stones are freedom of religion, *freedom of speech, freedom of the press and* last but not least freedom of opportunity to the individual under the competitive enterprise system.

Many are warning us as to what may come unless we change our governmental course. Some call the present trend collectivism, some call it statism, and some call it the welfare state, but let us not be technical as to the name of this new "ism." I would call it "ruinism" because these new policies of government will destroy the free enterprise system. America today stands at the crossroads. We can continue down the road to state socialism and ultimate disaster, or we can strengthen and revitalize the free enterprise system which has given to us our freedoms, and then go forward to a nobler and greater destiny. There are those who believe that socialism can be turned on and off as if it were water flowing through a spigot, and there are those who profess to believe we can have a little socialism and remain free.

For those who think "a little socialism" is a good thing, there is the British example. From what we have seen in England, we would be the most stupid nation on earth if we allowed ourselves to become further embraced by the socialism which has been creeping upon us for too many years. Socialism and free enterprise cannot live under the same roof. England thought they could, but, to her sorrow, she has found it is impossible. She socialized the coal mines, and the production of coal immediately declined. For the first time in her history, England is importing coal. She socialized the steel industry, and the production of steel immediately declined. She socialized civilian aviation, the electric supply industry, the Bank of England, the inland transportation system, the gas industry, and many other functions and enterprises essential to the welfare of her people, including socialized medicine, agriculture and the legal profession.

A friend recently sent me a copy of the London *Times*. On the first page it had a list of 150 farmers whom the government had charged were guilty of bad husbandry, because they had not obeyed the government bureau on what to plant, when to plant, and when to harvest. This notice said that unless these farmers mended their ways their farms would be confiscated. Not paid for, not condemned, but confiscated, in the free land of England! For a thousand years England has boasted that the Englishman's home is his castle, and now under socialism our friends across the sea have reached such a low estate that if a farmer does not obey the order of a bureaucrat, he is subject to the penalty of having his property confiscated.

In England there are only 70 Britons who have an income of $16,800 or more, after taxes. The rich have been liquidated. But to liquidate the middle classes, you strike at the heart and core of any country. This England has been gradually doing, as there are only 320,000 Englishmen now who have incomes of from $2,800 to $5,600 or more a year, after taxes.

In the face of these facts, are we going the road of England? Just recently, England, with momentous effort, decided to attempt the road back. By direct vote, she ousted the socialistic Labor Party and installed Winston Churchill, who I think is the greatest man of his generation, and to whom England has so often turned in her days of peril. But I fear there is little reason to expect that even under this great leadership England can return to the free enterprise system. England has repented and all of us wish her well, as she is our friend and ally.

As I see it, the welfare state, about which we have been hearing so much in recent years, is that state of twilight in which the glow of democratic freedoms is fading beyond the horizon, leaving us to be swallowed in the blackness of socialism, or worse.

In many federal programs we are chasing a mirage of easy money in the form of deficit dollars. Some of us have been duped into believing that the easy dollars handed out by the federal government are something for nothing. But, actually, these programs are adding to the public debt, undermining the will of individuals, regimenting the production of agriculture and labor, controlling the practices of business, curtailing the solvency of states, and destroying the self-determination privileges which are traditional in our local governments and domestic customs.

Make no mistake—it is socialism which lies at the end of this rainbow, and, in this rainbow, the predominating color is the red of federal deficit spending under which a whole new generation *of Americans has grown and developed. As to where* we stand today, the last time the socialist party in the United States campaigned actively in a presidential election was in 1932.

Today, virtually every plank in that 1932 socialistic platform has been enacted into federal law, and, in some cases, enlarged upon. For this reason I assume the Socialist Party as such has not been active since they have gained their objectives. Read this platform and you will see.

This is not a brash opinion of my own. Let us call to the witness stand Earl Browder, former leader of the Communist Party in America, and an authority on communism and socialism, who recently listed 22 socializing items adopted by the federal government ranging through deficit financing, price controls, government housing, and "full employment" laws. These 22 items, he said, expressed "the growth of state capitalism . . . an essential feature of the confirmation of the Marxist theory. . . . It represents the maturing of the objective prerequisites for socialism, the basic factor which makes socialism inevitable."

Mr. Browder further said: "Socialism has progressed farther in America than in Great Britain under the Labor Government, despite its nationalization of certain industries, which is a formal state not yet reached in America."

Adoption of the Truman Fair Deal program, as he has outlined it . . . and recently reaffirmed it . . . would irrevocably put us on a one-way street to state socialism. Mr. Truman says it is an insult to the intelligence of the American people to say this country is on the road to socialism. I submit that it is an insult to our intelligence to assume that we do not realize that adoption of the President's program will commit us irrevocably to a *socialistic state*, from which there can be no retreat.

If the President is against socialism, I ask him to answer these questions: Why does he continue to pressurize Congress to adopt socialized medicine? He sent Oscar Ewing, at public expense, to England to get the "low-down" on their socialistic system for propaganda use in the United States. If the President does not recognize that the British experiment in medicine is socialism, he could inform himself from the debates in England during the last election. The President calls his plan national health insurance, but it is socialized medicine just the same.

The cost of socialized medicine in America is difficult to estimate. We do things on a very grandiose scale when it comes o spending money, as you know. If the federal government ndertakes to pay the expenses of our children when they are born, guard them through their lives from illness and the things that may happen to them, and then bury them, the cost will be huge. Some of the statisticians have estimated the ultimate cost at 20 billion dollars annually, and in 50 years, that amounts to a trillion dollars.

These statisticians further said that if you take a trillion dollars and pile one dollar on top of another, it would extend 2,096,000 miles high—seven times the distance to the moon—with enough left over to pay our present national debt. I am told that is accurate, but I have not checked it.

If the President is against socialism, why is he advocating the Brannan plan, which inevitably means socialized agriculture? This plan not only would contribute in a huge way to the bankruptcy of America, but would create such chaos in the production, sale and distribution of food as to make it necessary for the government to take over these functions that must remain competitive in private hands. President Truman and Secretary Brannan are now conducting a nation-wide campaign to force the Brannan plan through Congress, notwithstanding the fact that the great farm organizations such as the American Farm Bureau Federation and the National Grange, as well as most of the farmers of this country, are bitterly opposed to this plan. They realize it will be the end of free enterprise in agriculture.

The only sincere thing Mr. Brannan has said about the plan is that he could not estimate the cost of it. Testifying before a committee of Congress, he gave this glowing picture of what the Brannan plan would do—reduce the cost of food to the consumer, pay the farmers a high profit for what they produce —but he did not fill in the gap by telling how the federal government could obtain the vast sums necessary to pay for the difference between food at low cost to the consumer and high prices to the farmer.

If President Truman is opposed to socialism, why is he advocating another extension of socialized housing?"

These three proposals alone would mean socialization o health, your food, and the roof over your head. But this i all. If the President is opposed to socialism, why is h stantly advocating an extension of the number of those receive payments from the Treasury of the United States? T there are 17 million Americans receiving regular payme rectly from the federal government, and 8 million more a the rolls of counties, cities and states. These 25 million, their families, constitute a substantial part of our popu

Socialism can be *effectively promoted* by constantly in ing those who are on the public payroll. A population o ernment dependents is a socialized population.

Among the cardinal characteristics of socialism are g ment subsidies with controls, and government dole with mentation. I am against that.

The American system, operating in the fullest freed democracy, stimulates individual initiative to the develo and production of more of what we need, in peace or wa cost we can more easily afford from the earnings of o deavor. I am for that.

The American Medical Association *needs no definition* free enterprise system from me. It is the system which, relatively short span of 160 years, has brought us from t potency of 13 un-united colonies to our present position o leadership. I do not concede that it should be scrapped for ism in welfare state clothing, which never brought gre happiness or security to any nation.

The American system has developed individual fr under constitutional democracy to the fullest measu known to man. It is the system which is always ready to the vital spark needed by the deserving to explode me into genius. It is the system which supplies the incentive fo at the bottom to rise to the top.

It is the system, which enables us with only 6 per cen world's population to outproduce the rest of the world co It is the system which produces steel, the prime requirem military defense, at a rate of three tons for every one p by the rest of the world—at a rate of *more than four* every one ton produced by Russia.

I challenge the socialists to produce a practical su for the free enterprise system's capacity to hold Russia aggression at bay. Our free enterprise system is a greate rent to Russian agression than the United Nations ever It is this system which is our first line of defense. Armies, and air forces are merely the tools through which the of this system is applied in war. With our eyes wide op we yield to the ever-increasing socialization of those fr and institutions which are vital to our democratic fre prise?

With respect to the checks and balances against federal provided in our system of state and local governments, pending in Congress now legislation under which the government would usurp local police power and state co elections.

With respect to checks and balances between the ex branch and the Congress, the Honorable Roswell P. former Under Secretary of the Treasury, now President Tax Foundation, recently testified that despite the consti mandate that federal expenditures be controlled by C "Congress does not have that kind of control today." It h chipped away insidiously over the past 20 years by giv program after give-away program which have commit federal Treasury without annual review by Congress.

From George Washington's administration to April, 1 cluding the Roosevelt administration, the federal gove took in taxes from the American people 248 *billion* dol six years and two months, from May, 1945, when Mr. T took office, to June, 1951, the federal government took f 255 billion dollars.

In plain words, in less than six and one-half years, in only three months of world War II, Mr. Truman has take the people in the form of federal taxes 7 billion dollars than was paid into the Treasury in the previous 156 y our existence as a nation. This is the record of Mr. Trum tax collector. Now let us look at the record of Mr. Trum spendthrift. From the administration of George Washing ıe beginning of World War II, federal expenditures totaled 179 illion dollars. From the end of World War II, in six years nder Mr. Truman, the federal expenditures totaled 260 billion ollars, or 81 billion dollars more than in the entire life of our ation, excepting the three and a half year period of World War I. When I first compiled these figures they appeared so fantastic ıat I had them checked from the official Treasury statements) prove their accuracy. The figures are correct.

In fiscal 1953 the Budget Bureau estimates the federal exenditures at 85 to 90 billion dollars. If so, Mr. Truman will ›end in one year—the year beginning July 1, 1952—more ıan one-half as much as all previous presidents spent up to /orld War II.

It is alarming to note that in only one year in our history have 'e exceeded this estimated 1953 fiscal year spending. In fiscal 945, at peak of World War II, we spent 98 billion. Then we 'ere financing the greatest war in history. Now we are engaged ı a police action in Korea. How much farther can we go in ıis reckless financial irresponsibility?

Now for a "Byrd's"-eye view of the federal budget. Based pon the Budget Bureau estimate of spending for fiscal 1953, ıe deficit will be from 17 to 20 billions in one year, as the income om federal taxation in this year under present tax rates will : 68 billion dollars to 70 billion dollars. In addition, our local ıd state taxation will be about 19 billion dollars.

Americans are paying nearly 30 per cent of the national in›me in taxes. Our taxes have reached the confiscatory stage, hich means that new taxes will probably result in diminishing :turns.

In the circumstances, it is natural to ponder the question: /hen does a nation become insolvent? In a system such as ours, hen and how does national insolvency manifest itself? There robably will be no milestone to mark the cross road, but it seems) me that a democracy is approaching insolvency when: (1) we re unable to pay current costs of government over a prolonged :riod with taxes short of confiscation and diminishing returns, ıd, (2) the constant cheapening of the dollar is a result of gov›nment operations. If these are the symptoms, it would appear ıat the diagnosis of our present and prospective fiscal situation unmistakably clear. The thing that is most inflated in America ›day is the federal government. Big government costs big money. ıflation is conceived and born in Washington. Only the federal ›vernment can spend in unlimited amounts. It alone determines ıe value of money and the extent of credit, because it alone is :gally empowered to do so. A federal bond is a first mortgage n all the property owned by every American citizen.

The reckless spending of the Truman administration has preipitated a federal fiscal crisis which many of us may not fully :alize, but, unless we retrench, we can anticipate a constant eterioration of our currency and credit. There is only one road) solvency, and that is to stop spending money we do not have y elimination of every nonessential disbursement. Yet, every ffort by Congress to retrench is vigorously opposed by the 'resident and his cohorts. There is, in my opinion, only one ıntouchable item in the budget of the federal government, and hat is the interest on the public debt. This we must pay as a natter of honor and to preserve the value of our bonds.

The one overshadowing characteristic of the administration ıow in Washington is fiscal weakness and irresponsibility. From his springs the demand for confiscatory taxes, stifling controls ınd centralization. If American democracy is destroyed, it will ›e the result of fiscal irresponsibility of which the present adninistration is guilty, and which, even now, is being exploited ›y political camp followers who would centralize all power and ›urse control in Washington. From these come a deadly assault ›n the free enterprise system, the creeping socialism and the scandals which Thomas Jefferson foresaw when he said, "I do verily believe that a consolidated government would become the most corrupt government on earth."

As I witness the moral deterioration of our government at Washington which has shocked and stunned the American people, once again I pay tribute to the foresight and wisdom of Thomas Jefferson, the founder of the legitimate democratic party.

I do not concede that either democracy or free enterprise, or any other American freedom has run the course of its usefulness in the world. They have been worth fighting for in the past against both economic and military challenge, and I do not concede that they were any dearer to those who have fought and won before than they are to us today. The battle lines are drawn. I am ready to fight. I hope you are. The forces of freedom in America need recruits.

What can we do? What can you do? I am frequently asked that question. I would say, first, that you must stand firmly against socialistic trends, because a little socialism inevitably means more and more socialism. There are many doors to the house of socialism. It is very easy to get in but very hard to get out. Let us not be misled into socialism by the back door. Let us judge for ourselves where these new "isms" will lead us and not be deluded by those who pay lip service to free enterprise and then advocate those things that would destroy it.

The American Medical Association has waged a clean—aboveboard—effective campaign against socialized medicine. You are fighting to preserve the great principles of our republic. You realize, as all of us should, that socializing an important segment of our daily life means that sooner or later further socialism will encompass other activities, resulting in a complete socialistic regime.

Do not be deluded into a sense of false security. Those who insist upon committing this country to socialism are ever on the alert. Today in the Senate of the United States there are few votes for socialized medicine. But when the slightest opportunity opens you will find those promoting these measures, ready to strike, like a snake in the dark. If Mr. Truman is reelected on this platform of state socialism he will assert that he has a mandate from the people to enact this full program into law.

Then I would say that you, the people of America, the voters at the polls, must demand that short of total war our federal budget must be balanced. I do not ask for "pet" federal appropriations but demand that the President and the Congress keep the federal spending within the ability of the people to pay. Let us all recognize that we cannot pyramid deficit after deficit on an existing federal debt of 260 billion dollars and survive as a democracy.

Once the American dollar goes down, we will enter an age of international darkness. The American dollar is the only thing today that is holding the world together. It is the only currency that everybody, everywhere in the world, has confidence in.

Those who, wilfully or otherwise, would destroy the American system of free enterprise, would destroy the freedoms of people everywhere. Today, we alone are bearing the standard. Without its light, freedom and progress would perish from the earth. We must not fail.

Without American solvency there would be no deterrent to communism abroad. In the existing circumstances it is no exaggeration to say that there is literally nothing on earth more important than the preservation of the fiscal integrity of the federal government of the United States and of the financial stability of the free enterprise system.

In conclusion, let me say, we should always remember that human freedom is not a gift to man; it is an achievement by man, and, as it was gained by vigilance and struggle, so it may be lost by indifference and supineness.

DR. CLINE: Thank you, Senator Byrd, for your splendid presentation in this nonpartisan discussion of the critical issues of 1952. Virginia has contributed much to the building of our America, and in this era, Senator Byrd, one of its finest contributions has been your presence in the United States Senate as a vigilant watchman and defender of American liberty.

On behalf of the American Medical Association, I wish to thank both Senator Taft, Republican, and Senator Byrd, Democrat, for taking part in this forum designed to help clarify the major public issues before the American people today.

ANNOUNCER: You have just heard Dr. John W. Cline, President of the American Medical Association, bring to a close an historic meeting of the House of Delegates of the A. M. A., a highlight of the Association's Fifth Annual Clinical Session here in Los Angeles. Dr. F. F. Borzell, Speaker of the House, also was heard on this program, which featured addresses by the Honorable Robert A. Taft, senior Senator from Ohio, and the Honorable Harry F. Byrd, senior Senator from Virginia.

TELEVISION IN HEALTH EDUCATION

The American Medical Association Clinic on Television in Health Education, held in New York, October 16, was attended by about 200 representatives of networks, advertising agencies, health and medical organizations, ethical drug houses, universities, school systems, and other groups interested in reaching a mass audience through this medium. Representatives of state medical societies from New York, Connecticut, Massachusetts, Ohio, New Jersey, and Minnesota were in attendance. The following county societies were represented: Harris County Medical Association, Houston, Texas; Medical Society of County of Kings, Brooklyn, N. Y.; Medical Society of County of New York; Nassau County Medical Society, Mineola, N. Y.; and Maricopa County Medical Society, Phoenix, Arizona.

The day was devoted to exploration of the problems involved in use of television as a device in health education of the public. The leadership furnished by experienced speakers and members of panels made it possible to furnish specific answers to many questions ranging all the way from audience measurement, through techniques, and the problems of cost.

Dr. W. W. Bauer, Director, Bureau of Health Education of the American Medical Association, supervised the planning of the Clinic and acted as general chairman of the meeting. The keynote address was presented by Dr. Louis H. Bauer, President-Elect of the American Medical Association. In emphasizing the obligation of the A. M. A. in educating the public to preventive medicine, Dr. Bauer pointed out that this responsibility rested not only on medical and allied professions, but also on radio and TV networks and stations in assisting the Association to realize their objectives in better health education.

Dr. Thomas Coffin, Supervisor of Program Research Division, National Broadcasting Company Television Network, presented the relationship between television advertising and sales results based on the Hofstra studies.

Mr. Ted Cott, general manager, WNBC-WNBT, New York, urged that public service agencies use the techniques of the commercial broadcaster trying to sell a product in setting themselves the task of selling their audience health education.

Mr. Leo Brown, Director of Public Relations, American Medical Association, stressed the need for joint responsibility among medical groups, voluntary agencies, governmental agencies, and the television industry in making authentic health information available to the public.

Roy K. Marshall, who discussed "Listeners' Reactions," declared that the public does want to be informed. "This is amply demonstrated by every discussion program which has ever been on the air."

The session continued at luncheon, when Sam Silverman, New York cab driver, reported on his six-week survey conducted among his passengers regarding their viewing of health education telecasts. The report pointed out the necessity for more and better health information, requested by many passengers. It also showed the need for helping the lay audience distinguish between commercial information and authentic health guidance.

Ralph Creer, Director, Committee on Medical Motion Pictures, A. M. A, presented kinescopes as graphic demonstration of the great potentialities of TV as a means of awakening people to the dangers and proper methods of cure and prevention in disease.

Seymour Siegel, director, WNYC, New York, led the discussion in the afternoon. Panel members included Erik Barnouw, editor, Communication Materials Center, Columbia University Press; Ralph Foster, chief, Films and Television Section, Department of Public Information, United Nations; Dr. Claude-Starr Wright, assistant professor of medicine, Department of Medicine, Ohio State University; Dr. George Wheatley, third vice-president, Health and Welfare, Metropolitan Life Insurance Company; James Macandrew, director, Board of Education Station WNYE, New York City; Gerald W. Tasker, research director, Cunningham & Walsh, Inc.; and William Vance, TV Production Staff, McCann-Erickson, Inc.

MEDICAL DEFENSE MEETING

The two-day Medical Civil Defense Conference spons by the American Medical Association, the American Hos Association, and the Association of State and Territorial Hea Officers at the Palmer House in Chicago Nov. 9-10 drew a attendance of 250, the largest crowd ever to attend a medi meeting of this kind. Dr. James C. Sargent, Milwaukee, cha man of the A. M. A. Council on National Emergency Medi Service, which initiated the meeting, said, "its success is a n inspiration to all of us in exerting a greater effort for the job ahead."

Conference delegates passed unanimously a resolution, int duced by Dr. Perrin H. Long of New York, calling for all me cal personnel to be "assigned to their proper places in the lo civil defense organization; their assignment to be the respo bility of the legally authorized civil defense officers accord to the laws in the various states, and only after full consu tion with the local, state and/or national professional hea organizations which exist in the various fields." The resolut said further that "the professional and tactical organization training of individuals and units will be the prime responsib of legally authorized civil defense officers, again, only after consultation with local, state and/or national professional he organizations in these fields."

There were many speakers on the two-day program, inc ing Millard F. Caldwell, administrator, Federal Civil Def Administration, and Dr. William L. Wilson, assistant adm trator, Health and Welfare, Federal Civil Defense Admini tion. C. Joseph Stetler, Secretary of the Council, said that point that stood out after the many speeches was that of absolute necessity of coordination between health and wel planning in developing a well-rounded program of disaster re Dr. Norvin C. Kiefer, director of Health and Special Weap Defense Division, said afterward that he hoped the confer would prove an inspiration for genuine nationwide coopera between the health officer, the hospital, and the medical allied health personnel—of all categories—in the civil def movement. He stressed one other point: that the necessity mobile support, to be fully met, must depend upon health sonnel in the remote areas, not in the target areas.

An afternoon panel gave an excellent close-up view of Federal Civil Defense Administration's operations in the va fields. "If there was one central theme," Dr. Sargent said "it seemed to be that now since the preliminary phases of ning, financing and procedure have passed, it is high tim make a positive and concerted effort at recruitment of the dreds of thousands of American citizens necessary to carry *this gigantic program*."

RESIGNATION OF DR. KELLOGG SPEED

The Committee on Scientific Exhibit of the Board of Tru has accepted the resignation of Dr. Kellogg Speed, Chicag Chairman of the Special Exhibit Committee on Fractures, e tive at the close of the Los Angeles Session. Dr. Speed has chairman of this Committee for 25 years, first being appo in 1926. In addition to the demonstrations on the treatme fractures at the Annual and Clinical Sessions of the Amer Medical Association, he has been largely responsible for "Primer on Fractures," now in its sixth edition.

Dr. Frederick A. Jostes, St. Louis, has been appointed C man to succeed Dr. Speed. The other members of the Com tee are Dr. Gordon M. Morrison, Boston; Dr. Ralph Carothers, Cincinnati, newly appointed. Dr. Kellogg Spee comes emeritus member.

PRESIDENT-ELECT VISITS AIR BASE

Dr. Louis H. Bauer, President-Elect of the American M cal Association and consultant to the Air Force Surgeon eral, visited Langley Air Force Base last month to o first-hand observation of local problems in aviation med prior to the consultants conference held by the Surgeon Gen

With the 47th Medical Group acting as host, Dr. Bauer to base headquarters, flew aloft in a B-45, and checked other m cal aspects of Air Force work. Dr. Bauer was the first mandant of the School of Aviation Medicine and is editor o *Journal of Aviation Medicine*.

TWELFTH ANNUAL CONGRESS ON NDUSTRIAL HEALTH

Hotel William Penn, Pittsburgh

Jan. 18-19, 1952

PRELIMINARY PROGRAM

Sponsored by
The Council on Industrial Health of the A. M. A.
Medical Society of the State of Pennsylvania
Allegheny County Medical Society

FRIDAY MORNING, 9:00—FORT DUQUESNE ROOM

REGISTRATION

FRIDAY MORNING, 10:00—URBAN ROOM

OPENING SESSION

ANTHONY J. LANZA, M.D., *Presiding*
Chairman, Council on Industrial Health;
Chairman, Institute of Industrial Medicine, New York University-Bellevue Medical Center, New York

o be Announced

o be Announced

ndustrial Health is Industrial Strength
HOWARD A. RUSK, M.D., D.Sc. (Hon.); Professor and Chairman, Department of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center; Associate Editor, The New York Times; Chairman, Health Resources Advisory Committee, Office of Defense Mobilization, New York.

ANEL ON PERIODIC HEALTH EXAMINATIONS

FRANK M. JONES, M.D., *Presiding*
President, American Academy of Occupational Medicine, Montreal

articipants:
FREDERICK H. SHILLITO, M.D., Director, Atlantic Division, Pan American World Airways System, New York
LEMUEL C. MCGEE, M.D., Hercules Powder Company, Inc., Wilmington, Delaware
BENJAMIN V. WHITE, M.D., Hartford, Connecticut

FRIDAY AFTERNOON, 2:00—URBAN ROOM

JAMES H. STERNER, M.D., *Presiding*
Medical Director, Eastman Kodak Company
Rochester, New York

linical Pulmonary Physiology
HURLEY L. MOTLEY, M.D., Director, Cardio-Respiratory Laboratory, Jefferson Medical College Hospital, Philadelphia

Evaluating the Effect of Industrial Noise on Man
HORACE O. PARRACK, Major, USAF; Chief, Bio Acoustic Unit, Wright Air Development Center, Wright-Patterson Air Force Base, Dayton, Ohio

Eye Health Evaluation and Maintenance
ARTHUR K. PETERSON, M.D., Medical Director, The Lakeside Press, R. R. Donnelley & Sons Company, Chicago
A. D. RUEDEMANN, M.D., Detroit

FRIDAY EVENING, 6:30—BALLROOM

ANNUAL DINNER

ANTHONY J. LANZA, M.D., *Presiding*

Health for the American Worker—A Joint Responsibility
Speakers to be Announced.

SATURDAY MORNING, 9:30—URBAN ROOM

OCCUPATION HOUSEWIFE

Jointly sponsored by the Council on Industrial Health and the Woman's Auxiliary, American Medical Association

MELVIN N. NEWQUIST, M.D., *Presiding*
Medical Director, The Texas Company, New York

Keynote Presentation
LILLIAN M. GILBRETH, Dr. Eng., Consulting Engineer, Montclair, New Jersey

Women in Our National Work Force
FRIEDA S. MILLER, Director, Women's Bureau, U. S. Department of Labor, Washington, D. C.

What Happens When the Homemaker Goes to Work?
ELIZABETH SWEENEY HERBERT, Household Equipment Editor, McCall's Magazine, New York

Housekeeping—A Dangerous Trade?
THOMAS FANSLER, Director, Home Safety Division, National Safety Council, Chicago

Energy Saving Procedures for the Disabled Housewife
The Disabled Cardiac Person
JOHN G. BIELAWSKI, M.D., Executive Director, Michigan Heart Association, Detroit

The Orthopedically Disabled Person
EDITH L. KRISTELLER, M.D., Director, Disabled Homemakers Research Project, New York University-Bellevue Medical Center, New York

SATURDAY NOON, 12:00—BALLROOM

LUNCHEON

Sponsored by the American Association of Industrial Nurses (Pittsburgh Chapter)

SATURDAY AFTERNOON, 2:00—URBAN ROOM

OCCUPATION HOUSEWIFE
(CONTINUED)

MRS. HAROLD F. WAHLQUIST, *Presiding*
President, Woman's Auxiliary to the American Medical Association, Minneapolis

Further Discussion of the Disabled Housewife
JULIA S. JUDSON, M.S., P.T.A., Coordinator, Disabled Homemakers Research Project, New York University-Bellevue Medical Center, New York

Survey for the Evaluation of Clinical Instruction on Work Simplification for Cardiac Patients
MARGARET AUSTIN, M.D., Chicago Heart Association; Chief Cardiologist, Women and Children's Hospital, Chicago

The Home Economist Adapts Work Simplification Course to Meet the Needs of the Cardiac Homemaker or Housewife
FRANCES G. SANDERSON, Professor of Home Economics, Chairman of Home Economics Department, Wayne University, Detroit

Question and Answer Period for Audience Participation

SATURDAY AFTERNOON, 2:00

HUMAN RELATIONS AND MENTAL HEALTH IN INDUSTRY

Discussion Program to be Announced.

Speakers to be Announced.

MEDICAL NEWS

ARIZONA

Service Award for Southwestern Physician.—Dr. W. Warner Watkins of Phoenix was honored at the annual banquet of the Southwestern Medical Association in October with a citation for 30 years of service. Dr. Watkins, who was editor of *Southwestern Medicine* for 12 years, served as secretary-treasurer of the association for 10 years and as president in 1920. He was presented a lifetime membership in the association.

CALIFORNIA

Chemical Society Anniversary Awards.—Professor Linus C. Pauling of the California Institute of Technology and Professor Choh H. Li of the University of California received two new medal awards inaugurated by the American Chemical Society's California Section in observance of the section's golden anniversary. Presentation of the medals was made November 27 at a dinner in Berkeley. Professor Pauling, a former president of the American Chemical Society, was awarded the Gilbert Newton Lewis Medal for his major contributions to chemical theory. He is internationally known for his research on the structure of crystals and molecules and on the nature of the chemical bonds that hold atoms together. The medal honors a University of California professor who was an outstanding authority on chemical thermodynamics. Not given on an annual basis, the medal will be presented only as the occasion warrants and only to North Americans. Professor Li received the California Section Medal for isolating corticotropin (ACTH) in 1942 and subsequent work on the hormone. He is presently professor in the department of biochemistry. This award will be given annually to a scientist under 40 years of age who has made a major contribution to chemistry while living in one of the 11 western states.

CONNECTICUT

le Receives Blake Portrait.—A portrait of Dr. Francis G. ake, Sterling Professor of Medicine and former dean of the ale University School of Medicine, New Haven, was formally presented to Yale University November 25 at a brief ceremony in the club room of the Sterling Hall of Medicine. The portrait was a gift of over 400 former colleagues, students, friends, and members of the medical school staff. This year Dr. Blake is retiring after completion of his 30th year of service at Yale to serve with the medical research and development program for the United States armed forces in Washington, D. C. An authority on chemotherapy, Dr. Blake did research on many epidemic diseases, including pneumonia, measles, scarlet fever, and typhus. In 1921 he joined Yale University School of Medicine faculty as a professor of medicine and one of the youngest men ever appointed to a full professorship at Yale. In 1940 he became dean of the school of medicine, a position he held for seven years. During this period he held a number of important government positions and served as president of the Army Epidemiological Board.

ILLINOIS

Grants-in-Aid of Cancer Research.—The American Cancer Society, Illinois Division, Inc., has received $20,000 from the estate of Ernest Kruetgen and $5,000 from the estate of Bessie Kultgen. In each instance the will stipulated that the money be spent only for cancer research. The society will therefore accept applications for grants-in-aid to support responsible cancer research projects to be considered by a special committee. Applications should contain full details concerning the nature of the project and what is hoped in the way of accomplishment. Sufficient information should be supplied to assure the committee that personnel concerned in the research are qualifi
that adequate facilities are available. Applications will b
cepted until January 1, 1952, and should be addressed to
John A. Rogers, Executive Director, American Cancer Soc
Illinois Division, Inc., 139 N. Clark St., Chicago 2.

Chicago

Testimonial Dinner for Dr. Hess.—Friends and former stu
of Dr. Julius H. Hess, professor emeritus, department of p
trics of the Universtiy of Illinois College of Medicine, will
a testimonial dinner in his honor at 6:30 p. m., January 2
the Congress Hotel. Those wishing to attend should se
check for $10, made payable to the Dr. Julius H. Hess Ba
Fund, to Dr. Samuel J. Hoffman, 629 South Wood St.

Award for Plan to Improve Medical Care.—Offer of an a
of $1,000 to the resident of Cook County submitting the
plan for improving medical care was announced December
the Chicago Medical Society. Entries will not be judge
literary quality but on excellence of ideas. The rules gover
the essay contest are as follows: 1. The subject of the essay
be, in general, the improvement of medical care within
framework of the free enterprise system. Plans involving
form of complete government control of our medical care
tem will not be considered. 2. Essays shall be limited to
words. They shall be typewritten on only one side of the
double-spaced, and the author's name and address must a
at the upper right hand corner of the first page. 3. All e
must be received in duplicate not later than March 1, 19
the office of the Chicago Medical Society, 86 East Ran
St., Chicago 4. All residents of Cook County are eligib
compete, except doctors of medicine, their office employees
members of their families, and employees of the Ame
Medical Association, Illinois State Medical Society, or Ch
Medical Society. 5. Five essays will be selected for final
sideration. Each of the finalists will be requested to com
a questionnaire form to establish his eligibility and compl
with the contest rules. The winner will be notified about A

Lectures in Biochemistry.—A special lecture series on "Se
Topics in Biochemistry" will be offered Wednesday eve
during the winter quarter at the Downtown Center of the
versity of Chicago, 19 S. LaSalle St., beginning Januar
Lectures will cover three areas, "Social Implications of
chemistry," "New Techniques in Biochemical Research,"
"The Role of Biochemistry in Related Fields," and ar
signed for the general student rather than the advanced
chemist. A series ticket is $9 and single admissions are $
The schedule of lectures is as follows:

January 23, lecturer to be announced, Effect of Chemical Progr
the Practice of Medicine
January 30, Thomas B. Coolidge, associate professor of biochen
Nutrition and Population.
February 6, Henry R. Kraybill, Ph.D., director of research and
tion, American Meat Institute Foundation, Contributions of
cultural Biochemistry.
February 13, Merlin S. Bergdoll, Ph.D., assistant professor of
chemistry, Chromatography.
February 20, Bernard S. Schweigert, Ph.D., research associate i
chemistry, Microbiological Assay.
February 27, H. G. Williams-Ashman, fellow in surgery, Bioche
of Cancer.
March 5, Leon O. Jacobson, associate professor of medicine, Rad
Injury.
March 12, James W. Moulder, Ph.D., assistant professor of bioch
try, Biochemistry in Microbiology.

KENTUCKY

State Association Annual Awards.—The Kentucky State
cal Association at its annual meeting in October presente
three annual awards. Dr. Carl Norfleet, Somerset, who rec
the Distinguished Service Award, has been a member of
Pulaski County Board of Health for over 40 years and
served the association as councilor. He was a delegate t
house and has been a member of the Medical Economics

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

iittee for more than 10 years. Dr. Joshua B. Lukins was given he E. M. Howard Award for outstanding service in behalf of rganized medicine. He has been the association's delegate to ne American Medical Association since 1941 and is a member f the American Medical Association Judicial Council. He was resident of the Kentucky association in 1935-36 and has been hairman of the Medico-Legal Committee for 27 years. The . Watts Stovall General Practitioner Award was presented to)r. John E. Kincheloe, Hardinsburg, who has practiced there nce 1899. The award was accepted by his son since Dr. incheloe was ill.

IASSACHUSETTS

lultiple Sclerosis Research Grant.—A grant of $39,744 has een made by the National Multiple Sclerosis Society to the larvard Medical School and Massachusetts General Hospital, oston, for studies in multiple sclerosis under the supervision f Dr. Raymond D. Adams, chief of the neurological service f the hospital. A research clinic will be established at Massahusetts General Hospital for the diagnosis, treatment, and udy of multiple sclerosis patients. Patients in the Boston area ill be considered for admission to this clinic.

IINNESOTA

ersonals.—Dr. Charles H. Slocumb, associate professor of inrnal medicine at the Mayo Foundation, Rochester, was given ie Triennial Gold Medal Award by the West London Medicohirurgical Society in London, England, on October 5. This ward is conferred on a younger scientist for outstanding work.

ancer Lecture.—Prof. C. H. Andrewes, National Institute for ledical Research, University of Leeds, London, England, will ive the annual George Chase Christian Cancer Lecture at the niversity of Minnesota Medical School, Minneapolis, on Janury 15. His subject will be "Current Thoughts on Viruses and ancer."

ociety News.—Dr. Charles G. Uhley of Crookston was elected resident of the Minnesota Division of the American Cancer ociety at the recent annual meeting of the board. Stanley awks of Minneapolis, John J. Bittner, Ph.D., head of the epartment of cancer biology at the University of Minnesota, nd Dr. David P. Anderson of Austin were elected viceresidents.

IISSOURI

ersonal.—Dr. Walter L. Brandon of Poplar Bluff has been lected president of the State Board of Medical Examiners. Dr. Villiam J. Shaw of Fayette is secretary-treasurer.

leeting on Surgery Honors Dr. Graham.—Approximately 250 urgeons throughout the country came to St. Louis to honor)r. Evarts A. Graham, professor emeritus of surgery at the Vashington University School of Medicine, St. Louis, November 29-30. Dr. Graham retired as head of the department and Bixby Professor of Surgery last July 1. At a dinner Friday vening in the Jefferson Hotel announcement was made of the stablishment of the Evarts Ambrose Graham Award, which is o be given periodically to the surgeon who has made the most outstanding contribution internationally to surgery. The fund for the award, a medal, was contributed by former students of Dr. Graham. The principal speaker was Dr. Edward Delos Churchill, professor of surgery at Harvard Medical School and surgeon-in-chief of the Massachusetts General Hospital, Boston, who discussed Dr. Graham's career. Scientific sessions were held Thursday and Friday in the medical school auditorium. Among former students who presented papers were Dr. Brian B. Blades, George Washington University, Washington, D. C.; Dr. Warren Cole, University of Illinois, Chicago; Dr. Robert M. Moore, University of Texas, Galveston, and Dr. Nathan A. Womack, University of North Carolina, Chapel Hill. Dr. Graham has been a member of the medical school faculty for 32 years. He is considered a "surgical pioneer" and is well known for his work on the gallbladder and surgical treatment of cancer of the lung.

Hospital Physicians Receive Medals.—Forty-six physicians who had been in voluntary attendance at least 20 years at Kansas City General Hospital as teachers and workers received gold medals November 6 at the first medical staff meeting of the season. The medals were inscribed "in recognition of professional services rendered to Kansas City's less fortunate through the Kansas City General Hospital." Dr. Charles C. Conover, who was a student surgeon at the hospital in 1893 and a staff member from 1896 to 1934, had been associated with the hospital for the longest period. Others have been in practice in Kansas City from 30 to 50 years and still continue their advisory work at the hospital. The following physicians were honored: Theodore H. Aschmann, Jess V. Bell, Peter T. Bohan, Harvey P. Boughnou, Clarence S. Capell, Charles C. Conover, Charles C. Dennie, Frank D. Dickson, O. Jason Dixon, B. Landis Elliott, James R. Elliott, Ambrose E. Eubank, Eugene H. Ferguson, Paul A. Gempel, Edward T. Gibson (deceased), Max Goldman, Buford G. Hamilton, Jefferson City, Mo., H. Lewis Hess, Walter F. Holbrook, George H. Hoxie, Berkeley, Calif., Robert D. Irland, William R. Jackson, Albert N. Lemoine Sr., Paul Lux, Herman S. Major, James G. Montgomery, Benjamin L. Myers, Andrew W. McAlester Jr., George F. Pendleton, Bertram A. Poorman, George W. Robinson Sr., Robert M. Schauffler, Edwin Henry Schorer, David L. Shumate, Morris B. Simpson, J. Milton Singleton, Samuel H. Snider, Frank R. Teachenor, Druery R. Thorn, Harrison C. Trippe, Herbert Tuthill, Ross H. Underwood, Herbert S. Valentine, Damon O. Walthall, Edwin C. White and R. Lee Hoffman.

NEW HAMPSHIRE

Medical Society State Defense Meeting.—State and county defense committees were invited by the New Hampshire Medical Society's Committee on Emergency Medical Service to attend a symposium on national defense December 9 in Concord. Dr. Daniel J. Sullivan, Nashua, head of the society's committee, planned the symposium as a follow-up meeting for the National Conference on Civil Defense, which he attended in Chicago on November 9-10. Also invited to the meeting were representatives of the dental profession, hospitals, and nurses.

NEW YORK

Masonic Grants to Medical Schools.—The Masonic Foundation for Medical Research and Human Welfare, representing the New York Masons, presented special funds totaling $192,923.55 for medical research at six state medical schools. Recipients of the grants made October 24 are the University of Rochester, $26,657.85; State University of New York, Syracuse, $24,984.72; New York University, $72,623.83; Columbia University College of Physicians and Surgeons, $25,379.46; University of Buffalo, $19,650.60, and Irvington House for Cardiac Children, Irvington-on-Hudson, $23,618.09.

New York City

Plans for Institute of Administrative Medicine.—Dr. Willard C. Rappleye, dean of Columbia University's faculty of medicine, November 18 announced plans for setting up an Institute of Administrative Medicine, within the framework of the School of Public Health. It will combine training of graduate medical students for administrative leadership with research to determine the best methods for delivering maximum medical care at reasonable cost. An advanced degree in administrative medicine will be offered. In Dr. Rappleye's opinion, the end-result of this kind of training program will be the return of the administration of health to specially trained members of the medical profession. The administrator trained in the institute will be qualified to deal with the health and allied problems which are arising in every community, including (1) the increase in the average age of the population, which will necessitate increasing attention to facilities for the treatment of persons with chronic diseases; (2) increasing specialization in the medical profession, and the need for teamwork represented by group practice in many aspects of medical service; (3) the need for modern diagnostic laboratory facilities and personnel in many communities; (4) the rapid growth of hospital and medical insurance plans;

(5) the need for strengthening the ambulatory services of hospitals; (6) the need for developing home medical services, and (7) the continued development of programs of preventive medicine. Representatives of various voluntary and municipal hospitals, voluntary agencies, public health, medical, and other facilities in the New York area will be members of the coordinating group.

NORTH CAROLINA

Teaching with Motion Pictures.—The Duke University School of Medicine has produced more than 20,000 feet of teaching film and more than 6,000 colored slides under a program supported in part by a grant from the National Foundation for Infantile Paralysis. The program is under the direction of Dr. Joseph S. Markee, a professor of anatomy, who has worked with medical visual aids for 20 years. Students in anatomy get a movie preview of each quarter's work before classes begin. The full-length film is then divided into 20-minute short subjects, and students take advantage of continuous movie showings every afternoon to view the appropriate short subject. Two years later, when students take their examinations, they come back for a review-and-refresher showing and see the full length films again. Dr. Markee is a member of the motion picture committee of the Association of American Medical Colleges and a member of the Motion Picture Association of the American Academy of Anatomists.

PENNSYLVANIA

Health Poster Exhibit.—An exhibition of foreign health posters gathered by the Medical Society of the State of Pennsylvania will be open to the public through January 13 in the Reading Public Museum and Art Gallery. These posters on various health topics from fifty countries have been shown in the Pennsylvania State Museum in Harrisburg, the Cleveland Health Museum, and the fine arts galleries of the University of Pittsburgh. They have been on view in Reading since December 2.

Certificates for Postgraduate Instruction.—Certificates are being presented to 107 Pennsylvania physicians who have attended for ree years the courses of instruction presented under the aus- of the Commission on Graduate Education of the Medical ety of the State of Pennsylvania. The certificates, signed by deans of the seven medical schools of Pennsylvania, state that the recipients have attended the courses for approximately 220 hours, which have included instruction in medicine, surgery, pediatrics, and obstetrics. These refresher courses are presented five days in the fall and five days in the spring in 10 teaching centers throughout Pennsylvania. A faculty of 175 instructors from the medical schools of Philadelphia and Pittsburgh will teach in the centers throughout the year.

Philadelphia

Shmookler Lecture.—The Henry B. Shmookler Memorial Lecture of Mount Sinai Hospital will be given at the nurses' home auditorium at 9 p. m., December 27. Dr. John W. Gofman, associate professor of medical physics at the Donner Laboratory of Medical Physics, University of California, Berkeley, will speak on "Recent Concepts of the Pathogenesis of Atherosclerotic Cardiovascular Disease."

Society News.—The November meeting of the Pennsylvania Academy of Physical Medicine and Rehabilitation was held on November 15 in Philadelphia. The scientific program included the following:

J. Eugene Ruben, Stellate Ganglion Block in the Treatment of Apoplexy and Vasospastic Conditions.
Scott Whitehouse, Intravenous Tetracaine in the Treatment of Pain of Arthritis.
Richard T. Smith and Irwin F. Hermann, Rehabilitation in Rheumatic Diseases.

Neurology Building Addition.—On October 30 the Charles K. Mills Neurology Building was dedicated at Philadelphia General Hospital. This 750-bed addition was built at a cost of 8 million dollars and contains a complete division of physical medicine and rehabilitation. At the opening exercises addresses were delivered by Hon. Bernard Samuel, mayor, City of Philadelphia; William C. Brown, state secretary of welfare; Drs. Rufus S. Reeves, director of public health; Pascal F. Lucchesi, r director, Philadelphia General Hospital, and S. Dale president of the medical board of the hospital. The guest was Dr. Henry Alsop Riley, New York Neurological I College of Physicians and Surgeons, Columbia Universit

TEXAS

Personals.—Dr. Eugen Kahn, New Haven, Conn., h appointed professor of psychiatry at Baylor University of Medicine, Houston. He is a former Sterling Clini fessor of Psychiatry at Yale University School of Medic

Course in Surgery.—A refresher course on trauma emergency surgery will be offered at the University o Medical Branch, Galveston, January 7-11. This cour signed particularly for general practitioners and is to sored jointly by the Medical Branch and the Texas State Association.

VIRGINIA

Personal.—Dr. James Robert Cash, since 1931 Wal Professor of Pathology at the University of Virginia De of Medicine, Charlottesville, was honored on his 20th sary, December 1, by colleagues and friends at a ba Keswick Country Club, Charlottesville.

New Hospitals.—The Louise Obici Hospital was ded Suffolk last fall. This 100-bed hospital is a memorial Louise Obici, wife of the founder of the Planters Chocolate Company of that city. The Shenandoah Memorial Hospital was also dedicated in September. pital is located at Woodstock and cost $800,000.

WEST VIRGINIA

Health Education Director Goes to Panama.—Mr. W Rost, director of the bureau of public health educati state department of health, has resigned to accept an ment on the field staff of the Institute of Inter-America He will serve as health education consultant to the M Health at Panama City, Panama Canal Zone. The ac the new program include the construction and ope health centers, the conduct of a campaign against epid endemic diseases, the dissemination of health informa the training of local health personnel in modern pub practices. The program provides that the host count the major portion of the personnel and funds, with t States Government furnishing technical assistance. jamin M. Drake, deputy director of health, will serve director of the bureau of public health education un cessor to Mr. Rost is appointed.

GENERAL

Measles.—The incidence of measles increased the w ing November 24 as compared with the previous wee the same week last year, according to the U. S. Publi Service. Approximately three-fourths of the cases for rent week were reported in the northeastern states. seasonal low week, about September 1, a total of 20, have been reported, as compared with 12,700 for the sa of 1950.

Award in Industrial Ophthalmology.—At the meetin American Academy of Ophthalmology and Otolaryn Chicago, October 14-18, the annual award from the C on Industrial Ophthalmology was presented to Captain W. Shilling, MC, USN, Deputy for Bio Sciences, Office Research and director Research Division, Bureau of and Surgery, Washington, D. C., "in recognition of ing leadership and service to scientific research."

Kiwanis Plans Study of Spastic Paralysis.—Funds for a five-year research program on spastic paralysis are bei by the Illinois and Eastern Iowa district of Kiwanis tional through voluntary contributions from the mem cording to Harry S. Himmel of Chicago, chairman of trict's spastic child committee. The money will be naintain a specially trained physician at one of the medical chools in the Chicago area to devote his full time and energy to esearch into the cause, prevention, and treatment of spastic aralysis. When the entire sum is pledged, the district will set p a Foundation for Research for Spastic Paralysis to carry out he program.

nternational Prize on Trachoma.—The International League gainst Trachoma will give an international prize of 100,000 rench francs in 1952 for the best work on etiology, pathogeny, athologic anatomy, or physiology of the trachomatous eye. he award was created by Mrs. Cuenod and Roger Nataf of unis. Five copies of the work accompanied by an abstract of our typewritten pages in French, English, Italian, and Spanish, ust be sent to the Secretary General, Dr. Jean Sedan, 94, rue ylvabelle, Marseilles, before March 1, 1952. The winning work ill be published in various languages in the *Revue Internaonale du Trachome*. The prize will be awarded at the general eeting of the Congress of the Societe Francaise d'Ophthalologie in 1952.

ulbright Scholars in United States.—Lists of visiting scholars om abroad receiving travel grants in the Fulbright program r 1951-52 are now available from the Committee on International Exchange of Persons, Conference Board of Associated esearch Councils, 2101 Constitution Avenue, N. W., Washingon 25, D. C. Many of the scholars at assigned institutions would elcome invitations to visit other institutions, provided the exense of travel was covered by the university or college inviting em. It is suggested that such invitations include clear informaon as to the expense involved because of the limited dollar sources of most of the visiting scholars. A total of 69 scholars medicine are in the United States for periods varying from ree to nine months.

rants for Research on Blindness.—The National Society for e Prevention of Blindness has made grants totaling $8,942 r research on eye diseases and defects that can lead to blindess. At present only a few hundred thousand dollars is spent nnually in the United States for research on blindness. In conast, the American public last year spent 125 million dollars r pensions and care of those already blind. Grants went to e Massachusetts Eye and Ear Infirmary in Boston, Western eserve University in Cleveland, and Washington University chool of Medicine and McMillan Eye Clinic in St. Louis. A ortion of the funds in the Western Reserve and Washington niversity grants came from a New Jersey organization, New yes for the Needy, which is cooperating in the national research rogram.

ociety Elections.—At the annual meeting in Vancouver, B. C., November the North Pacific Surgical Association elected as ajor officers for 1952 Dr. Richard E. Ahlquist of Spokane, Vash., president; Dr. Thomas M. Jones of Victoria, B. C., rst vice-president, and Dr. John A. Duncan of Seattle, secreary-treasurer.——The board of directors of the Mississippi alley Medical Society, at its annual meeting in Quincy, Ill., November 18, elected the following officers for 1952: Dr. John I. Marker, Davenport, Iowa, president-elect, and Dr. Harold wanberg, Quincy, Ill., secretary-treasurer. Dr. Daniel L. Sexton f St. Louis is the 1952 president. The annual meeting will be eld at the Jefferson Hotel in St. Louis, October 1-3, 1952. The nnual meeting of the American Medical Writers' Association vill be held at the same hotel on October 1.——The American College of Surgeons at its annual meeting in San Francisco November 8 installed Dr. Alton Ochsner, New Orleans, as president, and chose Dr. Harold L. Foss, Danville, Pa., as president-elect. The secretary and the treasurer, appointed officers, are, respectively, Drs. Michael Mason and Warren H. Cole, Chicago. The next annual meeting will be held at the Waldorf-Astoria in New York September 22-26.

Fellowships in Cancer Research.—The American Cancer Society is offering a limited number of clinical fellowships and traineeships for postgraduate training in medicine, emphasizing diagnosis and treatment of cancer. Traineeships carry a maximum stipend of $3,600, and the recipient must be not over 40 years of age. Two types of training may be provided: 1. General training in diagnosis and treatment of cancer and other malignant diseases, with instruction and practice in diagnosis, surgery, radiation therapy, medicine, and pathology without reference to the usual specialty. 2. Specific training in a restricted discipline or specialty, i. e., surgery or surgical specialties, pathology, radiology, and internal medicine, with instruction and practice which places major emphasis on cancer and other malignant diseases within the purview of the specialty selected. Fellowships and traineeships available on and after July 1, 1952, will be awarded for one year and are renewable for three years. Fellowships and traineeships are awarded to institutions only upon application by deans, executive officers, or department heads. Individuals desiring such fellowships or traineeships should consult the appropriate authority in the institution of their choice. Applications for the year 1952-53 must be submitted prior to Jan. 1, 1952. Further information may be obtained from the American Cancer Society, Professional Education Section, 47 Beaver St., New York 4.

Rehabilitation Services Needed.—To implement the work of physicians in rehabilitating crippled children, 30,000 occupational therapists, 26,000 physical therapists, 20,000 speech and hearing therapists, and 80,000 special teachers will be needed in the next five years to give adequate treatment, training, and education to handicapped children and adults, according to the National Society for Crippled Children and Adults, Chicago. Mr. Linck, executive director, said that a nationwide recruitment and training program for these fields is imperative. The estimate is based on results of the society's nation-wide survey of actual needs. Requests for physical therapists head the list of the National Society's Personnel Registry and Employment Service, most of them coming from physicians who have no facilities for physical therapy in their communities. The objective of these workers would be full utilization of the capabilities of millions of crippled children and adults whose skills are a great resource for industry and the professions. The national society has established scholarships and fellowship programs in cooperation with state societies and two national women's fraternities. Nearly 700 professional scholarships have been awarded as a result of this program. To aid in the recruitment of workers, the national society also maintains a free national Personnel Registry and Employment Service which cooperates with other professional organizations and which last year handled 2,412 referrals and 875 professional placements in critical jobs.

Merck Fellowships in Natural Sciences.—The National Research Council, Washington, D. C., has announced the availability of Merck Postdoctoral Fellowships in the Natural Sciences for 1952-53. All fields of chemistry and biology, including the preclinical medical sciences, are open to applicants. The fellowships carry stipends ranging from $3,000 to $5,000 plus travel expenses, and are offered annually to citizens of the United States with training in chemistry or biology equivalent to that represented by a Ph.D. degree. The program, supported by Merck & Co., Inc., manufacturing chemists of Rahway, N. J., is administered by the National Research Council, with which applications must be filed before Jan. 15, 1952. The purpose of the Merck Fellowships is to make possible special training, education, and development of young men and women who have demonstrated marked ability in research in chemical or biological science and who wish to broaden their fields of investigation. Fellowships will be awarded as soon as possible after March 1. Appointments are for one year, with tenure beginning July 1, 1952, unless otherwise arranged. Study may be carried out in this country or abroad. A stipulation is that each fellow shall pursue his research at an institution other than that which granted his doctoral degree, except in unusual cases. The fellowships were established in 1946 with a grant of $100,000 from Merck & Co., Inc., since supplemented by additional grants totalling $95,000. Further information and application blanks may be obtained from the Fellowship Office, National Research Council, 2101 Constitution Ave., Washington 25, D. C. A similar fellowship program has been established in Canada by Merck & Co. Limited, the Canadian subsidiary of Merck & Co., Inc., and is administered there by the National Research Council of Canada.

International Conference on Vitamins and Metabolism.—The University of Havana School of Medicine and Fundacion de Investigaciones Medicas are sponsoring an international conference on vitamins and metabolism in Havana, Cuba, January 25. This meeting will be held in the auditorium of the General Calixto Garcia Hospital in Havana from 8:30 a. m. to 9 p. m. The program will consist of lectures by many of the scientists who discovered, isolated, and synthesized vitamins. The fundamental chemistry, physiology, pharmacology, and pathology of vitamin deficiency diseases will be discussed, as well as methods of prophylaxis and treatment. Illustrative cases will be presented. The general chairmen of the conference will be Dr. Angel Vieta Barahona, dean of the medical school of the University of Havana; Dr. Jose Bisbe Alberni, professor of general pathology of the University of Havana, and Dr. Richard H. Young, dean of Northwestern University Medical School, Chicago. Among the North American speakers will be George R. Cowgill, Ph.D., Yale University, New Haven, Conn.; Conrad A. Elvehjem, Sc.D., University of Wisconsin, Madison; Karl A. Folkers, Ph.D., Merck and Company, Inc., Rahway, N. J.; Max F. Further, Ph.D., Hoffmann-La Roche & Company, Nutley, N. J.; Robert S. Harris, Ph.D., Massachusetts Institute of Technology, Cambridge; Dr. Philip S. Hench, Mayo Clinic, Rochester, Minn.; Thomas H. Jukes, Ph.D., Lederle Laboratories, Pearl River, N. Y.; Charles G. King, Ph.D., The Nutrition Foundation, Inc., New York; Herbert G. Luther, Charles Pfizer and Company, Inc., Brooklyn; Dr. William P. Murphy, Peter Bent Brigham Hospital, Boston; Dr. William H. Sebrell Jr., National Institutes of Health, Bethesda, Md.; Dr. Elmer L. Sevringhaus, Hoffmann-La Roche, Inc., Nutley, N. J.; William Shive, University of Texas, and Robert R. Williams, M.S., Research Corporation, New York. Dr. Ramon Suarez, Fundacion de Investigaciones Clinicas, San Juan, Puerto Rico, will also be a speaker. The faculty of the University of Havana will present representative clinical cases. Dr. Tom D. Spies, Dr. Robert E. Stone, and Samuel Dreizen, D.D.S., Birmingham, Ala., will assist in the presentation of clinical cases which they have studied in Havana. The Hotel Nacional, the Hotel Presidente, and the Hotel Sevilla-Biltmore, three of Havana's leading hotels, are accessible to the General Calixto Garcia Hospital. The Southern Medical Association, the American Medical Association, and the World Medical rganization will be officially represented at this conference.

EXAMINATIONS AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II*, Jan. 28-30. All centers where there are five or more candidates. Final date for filing application is Dec. 17. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: Various Locations, July 18. Final date for filing application is Jan. 18. Sec., Dr. C. B. Hickcox, 80 Seymour St., Hartford 15.

American Board of Dermatology and Syphilology: *Written*. Various centers. March 1952. *Oral*. Chicago, May 1952. Final date for filing application is Feb. 1, 1952. Candidates for these tests must have completed three years of approved training prior to July 1, 1952. Sec., Dr. George M. Lewis, 66 E. 66th St., New York 21.

American Board of Neurological Surgery: *Oral*. Chicago, May 1952. Final date for filing applications for the May 1952 examination is Jan 1, 1952. Sec., Dr. W. J. German, 789 Howard Ave., New Haven 4, Conn.

American Board of Obstetrics and Gynecology: *Written*. Feb. 1, 1952. Final date for filing applications was Nov. 1. *Oral*. Chicago, June 9-13, 1952. Final date for filing application is Feb. 1, 1952. Sec., Dr. Robert L. Faulkner, 2105 Adelbert Road, Cleveland 6.

American Board of Ophthalmology: *Written*. Twenty-five centers, Feb. 4-5, 1952. Sec., Dr. Edwin B. Dumphy, 56 Ivie Road, Cape Cottage, Maine.

American Board of Orthopaedic Surgery: Final date for filing applications for the 1952 Part II examinations was Aug. 15. Final date for filing application for the 1952 Part I examination is Nov. 30. Sec., Dr. *Harold* A. Sofield, 122 S. Michigan Ave., Chicago 3.

American Board of Pediatrics: *Written examination* under local

gology, Havana, Cuba, Jan. 20-24. Dr. Pedro Hernandez
8 No. 358, Vedado, Havana, Cuba, *General Secretary*.

DEATHS

Ippolito, Anthony Samuel ⊕ Chicago; born in Chicago Sept. 19, 1917; Loyola University School of Medicine, Chicago, 1943; instructor of orthopedic surgery at the University of Illinois College of Medicine and the Cook County Graduate School of Medicine; specialist certified by the American Board of Orthopaedic Surgeons; member of the American Academy of Orthopaedic Surgery, Chicago Orthopaedic Society, and the Clinical Orthopaedic Society; fellow of the American College of Surgeons; a captain in the medical corps of the U. S. Army during World War II, serving at a first aid station in Germany for many months; examining physician for the children who were members of the Hull House; affiliated with Columbus, St. Elizabeth's, and Cook County hospitals; at one time star fullback of Purdue University in La Fayette, Ind., and the Chicago Bears football team; died near Evanston, Wyo., in a train accident November 12, aged 34.

Harvey, Norman Darrell ⊕ Pelham, N. Y.; born in 1865; College of Physicians and Surgeons, medical department of Columbia College, New York, 1888; past president of the Rhode Island Medical Society; member of the American Academy of Ophthalmology and Otolaryngology, American Otological Society, New England Ophthalmological Society, and the New England Otolaryngological Society; fellow of the American College of Surgeons; specialist certified by the American Board of Ophthalmology and the American Board of Otolaryngology; served with the Rhode Island National Guard, and during the Spanish-American War; for many years practiced in Providence, R. I., where he was a consulting surgeon at Rhode Island Hospital and consulting ophthalmic surgeon at Providence Lying-In Hospital, Butler Hospital, Charles V. Chapin Hospital, and Newport (R. I.) Hospital; died in a hospital at New Rochelle, October 13, aged 86.

Ehler, Adrian Augustus, Albany, N. Y.; born in New Rochelle, N. Y., Oct. 5, 1908; Yale University School of Medicine, New Haven, 1933; associate professor of surgery (thoracic surgery), Albany Medical College; instructor in thoracic surgery, University of Michigan Medical School, Ann Arbor, from 1937 to 1939; certified by the National Board of Medical Examiners; member of the American Medical Association, American Trudeau Society, and the American Association for Thoracic Surgery; fellow of the American College of Surgeons; director of the Albany County Tuberculosis Association and vice-president of the Albany County Heart Association; served on the staffs of Glenridge Sanatorium in Schenectady, Homestead Sanatorium in Middle Grove, Pine Crest Sanatorium in Salisbury Center, Vermont Sanatorium in Pittsford, and the Albany Hospital, where he died November 5, aged 43, of acute leukemia.

Bland, Curtis ⊕ Oaktown, Ind.; Medical College of Indiana, Indianapolis, 1905; served overseas during World War I; died in the Veterans Administration Hospital, Indianapolis, September 6, aged 78, of hypertensive cardiovascular disease.

Chesley, Harry Oscar, Rollinsford, N. H.; Dartmouth Medical School, Hanover, 1898; member of the American Medical Association; died August 5, aged 79, of carcinoma of the colon and liver.

Clothier, Joseph V., Pocatello, Idaho; University of Pennsylvania Department of Medicine, Philadelphia, 1900; member of the American Medical Association and the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; affiliated with Pocatello General Hospital; died in Encino, Calif., October 16, aged 72.

Covner, Albert Henry ⊕ Lynn, Mass.; Tufts College Medical School, Boston, 1924; certified by the National Board of Medical Examiners; specialist certified by the American Board of Internal Medicine; affiliated with Lynn and Union hospitals; died November 9, aged 51.

Cunningham, Thomas Edward ⊕ Cambridge, Mass.; Harvard Medical School, Boston, 1910; an Associate Fellow of the American Medical Association; died in Holy Ghost Hospital September 11, aged 68, of multiple cerebral thrombosis.

Dougherty, John Allen ⊕ Oakland, Calif.; Vanderbilt University School of Medicine, Nashville, Tenn., 1916; specialist certified by the American Board of Urology; member of the American Urological Association; fellow of the American College of Surgeons; served in France during World War I; affiliated with Alameda County, East Oakland, and Providence hospitals in Oakland, Alameda Hospital in Alameda and Richmond Hospital in Richmond; died in Piedmont October 6, aged 60, of bulbar palsy and pulmonary tuberculosis.

Drago, Christie Joseph, Brooklyn; New York Homeopathic Medical College and Flower Hospital, New York, 1918; member of the American Medical Association; served during World War I; for many years on the staffs of Hospital of St. Giles the Cripple and the Samaritan Hospital; died October 23, aged 58, of cerebral hemorrhage.

Durling, James Krotzer ⊕ Wadsworth, Ohio; University of Michigan Homeopathic Medical College, Ann Arbor, 1919; served as president, vice-president, secretary, and treasurer of Medina County Medical Society; died in the Cleveland Clinic Hospital in Cleveland recently, aged 57, of congestive heart failure and arteriosclerotic heart disease.

Embry, Jerre Carl, Vincent, Ala.; Atlanta Medical College, 1889; member of the American Medical Association; died in Birmingham August 21, aged 85, of massive hemorrhage and carcinoma of the stomach.

Emerson, William Robie Patten ⊕ Boston; Harvard Medical School, Boston, 1899; an Associate Fellow of the American Medical Association; member of the New England Pediatric Society; professor of pediatrics emeritus at Tufts College Medical School; on the staffs of the Boston City and Massachusetts General hospitals; died September 5, aged 81, of cerebral hemorrhage.

Fisher, James E., Rome, Tenn.; University of Nashville Medical Department, 1907; died August 10, aged 71, of carcinoma of the pancreas.

Graham, Thomas Garland, Lafayette, Ind.; University of Louisville (Ky.) School of Medicine, 1933; member of the American Medical Association; served during World War II; on the staffs of Lafayette Home Hospital and St. Elizabeth Hospital; died October 7, aged 42, of injuries received in a plane accident.

Hagen, Walter Thomas, Green Bay, Wis.; Jefferson Medical College of Philadelphia, 1891; died August 15, aged 82, of cardiac decompensation and chronic myocarditis.

Hamer, John Dayton, Lowell, Ariz.; University of Nebraska College of Medicine, Omaha, 1937; member of the American Medical Association; died October 12, aged 39.

Hanson, Herbert Theodore, Madison, Wis.; University of Minnesota Medical School, Minneapolis, 1946; assistant professor of physiological chemistry at the University of Wisconsin Medical School; on the staff of Wisconsin General Hospital; died August 25, aged 30, of brain tumor.

Johnson, Raymond Lovejoy, Waycross, Ga.; University of Maryland School of Medicine, Baltimore, 1914; member of the American Medical Association; fellow of the American College of Surgeons; served on the staff of Ware County Hospital, where he died September 1, aged 69, of coronary occlusion.

Kory, Roscoe Conklin ⊕ Little Rock, Ark.; Medical Department of Tulane University of Louisiana, New Orleans, 1910; emeritus professor of surgery (ophthalmology) at the University of Arkansas School of Medicine; member of the staffs of St. Vincent's Infirmary, Missouri Pacific Hospital, and Arkansas Baptist Hospital; died September 29, aged 66, of coronary occlusion.

⊕ Indicates Fellow of the American Medical Association.

Lampe, Elmer Lewis ⊕ Bellevue, Iowa; State University of Iowa College of Medicine, Iowa City, 1910; for many years health officer; on the staff of Bellevue Memorial Hospital; affiliated with Finley and St. Joseph Mercy hospitals in Dubuque; died in University Hospital, Iowa City, September 22, aged 66, of ruptured aneurysm of the right internal iliac artery.

McClelland, Charles Stewart, Butler, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1897; died August 22, aged 80, as the result of a fractured back received in a fall.

Mitchell, Wilfrid Bede ⊕ Detroit; Detroit College of Medicine and Surgery, 1925; specialist certified by the American Board of Obstetrics and Gynecology; member of the Central Association of Obstetricians and Gynecologists; fellow of the American College of Surgeons; served during World Wars I and II; affiliated with Grace Hospital, where he died October 20, aged 53, of intraventricular hemorrhage.

Mitchell, William Wright, Memphis, Tenn.; Memphis Hospital Medical College, 1907; Columbia University College of Physicians and Surgeons, New York, 1908; also a lawyer; died October 9, aged 68, of uremia.

Negley, James Casper ⊕ Glendale, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1910; member of the American Urological Association; fellow of the American College of Surgeons; specialist certified by the American Board of Urology; on the staff of Los Angeles County Hospital in Los Angeles and the Physicians and Surgeons Hospital in Glendale; died in Glendale Sanitarium and Hospital October 23, aged 68, of coronary occlusion.

Powell, Nettie Bainbridge, Marion, Ind.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1892; member of the American Medical Association; past president and secretary of the Grant County Medical Society; first secretary of the Grant County Tuberculosis Association; formerly secretary of the board of health of Marion; served as a member of the board of directors of the Grant County Hospital Association; one of the founders of the Marion General Hospital; died September 26, aged 83, of cardiovascular renal disease.

Riley, Lincoln, Wisner, Neb.; State University of Iowa College of Medicine, Iowa City, 1888; served during World War I; died in Norfolk October 14, aged 84, of cerebral hemorrhage.

olston, Theron Rice ⊕ New Hope, Va.; Medical College of rginia, Richmond, 1929; member of the county school board; affiliated with King's Daughters' Hospital in Staunton and Community Hospital in Waynesboro; died in Tucker Hospital, Richmond, September 23, aged 49, of coronary thrombosis.

Schemmer, Anthony L., Colby, Wis.; Marquette University School of Medicine, Milwaukee, 1913; member of the American Medical Association; past president of the Clark County Medical Society; served as health officer for the town of Hull; member of the staff of St. Joseph's Hospital in Marshfield; died August 23, aged 61, of coronary thrombosis and arteriosclerotic heart disease.

Stevenson, Forney Caldwell, Montgomery, Ala.; Columbia University College of Physicians and Surgeons, New York, 1893; member of the American Medical Association; for many years a member of the county and city board of health, of which he had been president; served as president of the county board of education; affiliated with St. Margaret's Hospital; died September 9, aged 78, of suffocation when flames swept through his home.

Thompson, James Albert, St. Johnsbury, Vt.; McGill University Faculty of Medicine, Montreal, Canada, 1897; member of the American Medical Association; on the staffs of the Brightlook and St. Johnsbury hospitals; died September 29, aged 77, of coronary thrombosis.

Tremain, George W., St. Louis (licensed in Missouri in 1902); died September 21, aged 78, of heart disease.

West, Oscar Caldwell ⊕ Phoenix, Ariz.; Atlanta College of Physicians and Surgeons, 1899; served as health officer of Maricopa County, and as city and county health officer in Albuquerque, N. Mex.; received decorations from the government of Mexico and from Chile for his work on bubonic plague; died October 20, aged 72, of carcinoma of the lung.

West, William Moore ⊕ Monett, Mo.; Beaumont Hospital M
cal College, St. Louis, 1898; an Associate Fellow of the A
can Medical Association and member of its House of Dele
from 1933 to 1937; fellow of the American College of
geons; served during World War I; for many years local r
trar of vital statistics; formerly chief of staff, West Hos
now known as St. Vincent's Hospital; died in St. John's H
tal, Springfield, Mo., October 6, aged 78, of myocardial in
tion and hypertensive and arteriosclerotic heart disease.

Whisler, Edward Livingstone, Los Angeles; Starling Me
College, Columbus, Ohio, 1904; died in Hollywood Presbyt
Hospital October 22, aged 75, of carcinoma of the sigmoid.

White, John Francis, La Mesa, Calif.; College of Physi
and Surgeons of San Francisco, 1897; member of the Ame
Medical Association; past president of the board of heal
Auburn; died in Paradise Valley Sanitarium, National
September 15, aged 77, of carcinoma.

Hospital, Nebraska Methodist Hospital, and Universi
Nebraska Hospital; trustee of the Hastings (Neb.) College
October 9, aged 72, of hypertension and cerebral throm

Willis, William Moore, Farmville, N. C.; Medical Coll
Virginia, Richmond, 1914; died in Rocky Mount August 4
61, of gastric hemorrhage and duodenal ulcer.

Witzberger, C. Michael, Tucson, Ariz.; New York Homeo
Medical College and Flower Hospital, New York, 1934; for
on the faculty of his alma mater; member of the American
cal Association and the American Academy of Pedi
specialist certified by the American Board of Pediatrics; aff
with Tucson Medical Center and Pima County Hospital
August 18, aged 44, of a skull fracture received in an autor
accident.

Woods, Robert A., Clark, Mo.; University Medical Coll
Kansas City, Mo., 1892; died September 30, aged 82.

Wright, Eugene Orwin, Sheridan, Wyo.; Medical Coll
Virginia, Richmond, 1938; member of the American M
Association; served with the Veterans Administration; d
Denver October 10, aged 39, of cirrhosis of the liver.

Yoakam, Arthur Jacob, Homer, Ohio; Starling Medica
lege, Columbus, 1898; died in Memorial Hospital, Moun
non, August 31, aged 75.

Young, Philip Samuel, Sidney, N. Y.; Albany (N. Y.) M
College, 1896; served during World War I; died Augu
aged 77, of coronary occlusion.

Zimmerman, Joseph Jack ⊕ Philadelphia; University of
sylvania School of Medicine, Philadelphia, 1940; speciali
tified by the American Board of Internal Medicine; served
World War II; instructor in medicine at his alma mate
assistant instructor in medicine at the graduate school;
staffs of St. Agnes and Philadelphia General hospitals;
October 11, aged 36, of heart attack.

DIED WHILE IN MILITARY SERVICE

Barber, Albert C. ⊕ Commander, U. S. Navy, Chica
University of Illinois College of Medicine, Chicago, 19
member of the Illinois State Medical Society; associal
with the Chicago Board of Health on a part-time basis
many years; served during World Wars I and II; enter
the medical corps of the U. S. Naval Reserve in Augu
1942; following various assignments ashore and aflo
was transferred to the regular navy in July, 1946; at
time of death was serving at the naval ammunition de
in Hawthorne, Nev.; died September 30, aged 51, of
juries received in an automobile accident near Luni
Nev.

GOVERNMENT SERVICES

ELECTIVE SERVICE

lective Service System.—The information bulletin, vol. 2, No. , of the National Advisory Committee to the Selective Service stem reads as follows:

> ubject: New graduates in priority 3 who are also regular registrants and o have been deferred for any cause since June 19, 1951, and therefore e their liability for military service extended to their 35th birthday.
>
> ast June there were a number who graduated from medical school who regular registrants not having attained their 26th birthday and who n registered as special registrants in priority 3 as required by law, er having had military service subsequent to *September 16, 1940*, and e not deferred prior to March 31, 1947, by the Selective Service local rd for the purpose of studying medicine or were not ASTP or V-12 *dents* with less than 21 months of active duty. The percentage of such duates will increase each year.
>
> our advice to local boards on these individuals should be to the effect t they be deferred until the completion of their first year of internship, necessary in training for an essential occupation, and that at about the e of the completion of such internships, the registrant should be advised apply for a commission and *simultaneously for immediate active duty.* they do not apply for active duty, they will become priority 3 reserve cers which will not relieve them of their liability under the general visions of the Universal Military Training and Service Act, as amended. f they apply for a commission and as the result of their volunteering y are given immediate active duty, they will be classified as 1-C by ir local boards on both registrations. They will thus be given the opportity of serving their 24 months at a convenient time in their professional eers rather than at some future date, less convenient, prior to the ent of their 35th birthdays.

JBLIC HEALTH SERVICE

blic Health Journals Merge.—Beginning in January, 1952, *blic Health Reports* will be published monthly. Two other hnical publications of the Public Health Service—the *Journal Venereal Disease Information* and the *Communicable Disease nter Bulletin*—are being merged with it. The merger has come out as the result of an extended study of the Public Health rvice's publishing activities. The new journal is designed to rry out more efficiently and economically the Public Health rvice's responsibilities for disseminating scientific information matters of health.

The new *Public Health Reports* will be concerned with the hnical and professional aspects of public health practice, with oblems of health administration, and with research in these lds. It will include substantially the types of material that ve been appearing in the three present journals and the onthly Tuberculosis Control Issue of *Public Health Reports.* ere will be more emphasis, however, on administrative prace, program development, and applied research aspects and less nphasis on bench research and clinical material not directly lated to public health practice. As has been true with each the present journals, the pages of the new *Public Health Rerts* will be open, on merit, to any responsible author. General litorial guidance will be provided by a board of editors comsed of individuals of recognized competence and professional ature drawn from both within and outside the federal service.

Every effort will be made to furnish the new *Public Health eports* to representative organizations in public health and its lated fields. Most of the readers on the mailing list are affilied with organizations to which free distribution can legally e made. They will continue to receive the new journal either irectly or through these organizations. The first issue of the ew *Public Health Reports* and an application form for a free ubscription will be sent to readers now on the free lists for chnical periodicals. After they have had an opportunity to reiew the new *Public Health Reports* and to consider its usefulness in their work, readers who wish to remain on the lists and eceive the new periodical regularly should complete the application and send it in as soon as possible. This will allow time o revise the lists for mailing the second and subsequent issues. he new *Public Health Reports* will also be available by paid ubscription from the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Regular Corps Examination for Medical Officers.—Competitive examinations for appointment of medical officers to the regular corps of the United States Public Health Service will be held February 5-7, 1952, at a number of points throughout the United States. Applications must be received no later than January 2. Appointments will be made in the grades of assistant surgeon (equivalent to Navy rank of lieutenant [jg]) and senior assistant surgeon (equivalent to lieutenant). Gross pay is the same as for officers of equivalent rank in the Army and Navy. Entrance pay for an assistant surgeon with dependents is $5,686.56 per annum; for senior assistant surgeon with dependents, $6,546. These figures include the $1,200 annual additional pay received by medical officers as well as subsistence and rental allowance.

In making assignments, consideration is given to the officer's preference, ability, and experience; however, all commissioned officers are subject to change of station and assignment as necessitated by the needs of the service. Appointments are permanent and provide opportunities to qualified physicians for a life career in clinical medicine, research, and public health.

Applicants for either grade must be United States citizens who are at least 21 years of age and who have graduated from a recognized school of medicine. Applicants for the grade of assistant surgeon must have at least seven years of educational training and professional experience subsequent to high school. Applicants for the grade of senior assistant surgeon must have at least 10 years of educational training and professional experience subsequent to high school. Physicians who are successful in the examination and are now serving internships will not be placed on active duty in the regular corps until completion of internship.

Application forms and additional information may be obtained by writing to the Surgeon General, United States Public Health Service, Federal Security Agency, Washington 25, D. C. Attention: Division of Commissioned Officers.

Distribution of Yellow Fever Vaccine.—According to the Surgeon General of the Public Health Service (General Circular No. 99, Supplement 1) the Rocky Mountain Laboratory of the Public Health Service is the only laboratory in the United States on the World Health Organization's list of institutions producing approved yellow fever vaccine. Because the vaccine is highly thermolabile and must be stored and transported at a subfreezing temperature, strict control of its handling is required.

The director of the Rocky Mountain Laboratory, Hamilton Mont., in collaboration with the Laboratory of Biologics Control, National Institutes of Health, is responsible for setting standards for the transportation, storage, and administration of the yellow fever vaccine. Shipments of the vaccine originate from the Rocky Mountain Laboratory and are routed directly to the user except as provided below. The vaccine is not redistributed. The vaccine is distributed in the United States to the following facilities: (1) Public Health Service facilities; (2) Department of Defense installations; (3) organizations with large numbers of employees going into yellow fever areas; and (4) one health department of a state in which a yellow fever clinic of the Public Health Service is not available. The Epidemiology and Immunization Branch of the Division of Foreign Quarantine is responsible for approving facilities for the receipt of the vaccine, and investigates compliance with requirements for handling the vaccine.

The vaccine may be sold to private concerns, or their agents, to be sent abroad for inoculation of employees in yellow fever areas. It may also be sold to approved foreign governments. Inasmuch as the vaccine is on the restricted commodity list of the Office of International Trade, Department of Commerce, all sales for the purpose of exportation except those to Canada and countries of Central and South America must be approved by that agency. Orders not meeting the requirements of the Office of International Trade will be referred to the administrative officer of the Microbiological Institute.

ITALY

Medicosurgical Association.—At the Ionian Association of Medicine and Surgery meeting in Taranto, Prof. Carlucci lectured on treatment of tuberculous epididymitis from the clinical and social points of view. He demonstrated the rare advantage of the conservative methods based on local and general injections and stated that surgical intervention for removal of the epididymis and the extrapelvic vas deferens is the most suitable treatment. This type of intervention does not impair the preeminent function of the testis, because it is limited to the elimination of the external secretion and does not interfere with the hormonal secretion. The treatment is of considerable social interest, because within days it allows persons already debilitated by the long duration of pain, depressed by the chronic disease, and accustomed to change from one hospital to the other, to resume their occupations.

Prof. Buonsanti reported on the problem of surgery of cancer of the rectum, emphasizing that this chapter of neoplastic surgery has been discussed for 125 years, i. e., since Lisfranc performed the first operation. Twenty-two years ago a convention of surgeons studied surgery of cancer of the rectum in a specific way; a statement of Prof. Biaggio on that occasion, which affirmed that there is not yet a specific operation for this pathological process, is still valid today. There are two fundamental surgical techniques: (1) radical, through the perineum and the coccyx, and (2) conservative, through the abdomen. The latter, conceived by Mayo, is best for the surgeon who is more interested in the precarious operative results than in the safety of a radical exeresis.

Today the total operative mortality rate, because of the improvements of the laparotomy technique, is highly satisfactory in the hands of such experts as Mayo, but the evaluation of statistics presenting high survival rates should be guarded since the latter may be misleading because of misconception concerning some processes that are highly invasive with respect to lymph odes, representing Group C_2 of tumors according to Dukes' classification. The large number of surgical methods proposed (more than 30) and their late results show the need to refrain from aggravating the conditions of the patients by radical operation.

Because radical exeresis is not feasible, owing to the unknown origin of the lesion, Prof. Buonsanti considers that a conservative treatment like Mayo's is to be preferred, because it will give the patient the illusion of a desired recovery without functional sacrifices.

Nitrogen Mustard Poisoning.—Reports on experimental nitrogen mustard poisoning were presented at a meeting of the medicosurgical association of Pavia. Dr. Cattaneo made microscopic studies of the behavior of the liver in two groups of experimental animals to which nitrogen mustard had been administered by intramuscular route. Regular therapeutic doses, i. e., 0.10 mg. of nitrogen mustard per kilogram of body weight were administered for four or five consecutive days to the first group of animals, while highly toxic doses, i. e., 2 to 3 mg. per kilogram of body weight, were administered to the second group. The microscopic picture of the liver in the first group did not present significant changes. In the second group, the microscopic examination yielded evidence that nitrogen mustard in the doses used exerts a pronounced hepatotoxic action. This is characterized by more or less diffuse congestion of the liver, with some hemorrhagic foci generally localized in the intralobular spaces, and also by a cloudy degeneration of the hepatic cells associated with signs of nuclear disturbance. In some animals of the second group, severe lesions were observed associated with areas of pronounced nuclear fragmentation and small points of necrosis.

Dr. Cattaneo expressed the opinion that these lesions, in addition to the hepatotoxic action exerted by nitrogen mustard, are attributable to pre-existing areas of decreased functional activity of the liver caused by previous or still present disease processes or by circulatory disturbances. In the presence of the poison
these zones have the biologic characteristics of areas of
resistance.

Dr. Cattaneo and Dr. Tartara reported on the histologica
dition of the heart and of the great vessels in experiment
mals treated with nitrogen mustard intramuscularly in re
therapeutic doses and also in highly toxic doses. Alteration
not observed in the group treated with therapeutic doses,
some lesions were observed in the second group. The gre
sels sometimes showed considerable capillary dilatation
adventitial and the periadventitial areas. The heart sl
especially in the papillary muscles and in the subendo
areas, a pronounced ectasia of the capillaries and the pı
laries with eruption of red blood cells either by diaped
by rhexis, and with formation of interstitial edema. In th
involved areas the muscular fibrils presented signs of
swelling and also of vacuolation. The speakers emphasi:
importance of these findings in connection with the mec
of the production of some electrocardiographic alteratic
served in these animals.

Drs. F. Cattaneo and I. Cattaneo reported on the blo
ture in experimental nitrogen mustard poisoning after
ectomy. As in the other experiments the animals had r
nitrogen mustard intramuscularly in therapeutic doses
highly toxic doses. Results of the research showed tha
ectomy does not affect the hematopoietic response of tl
marrow to nitrogen mustard. On the contrary, splenectom
to have a beneficial effect on the resistance of the cir
blood elements; but this antileukocytolytic and antihe
effect does not seem to be of great practical importance,
it changes only slightly the course of the leukocyte and
cyte curves that are recorded after the administration c
gen mustard. Therefore, Rosenthal's concept of the nece
splenectomy in patients with Hodgkin's disease, before r
mustard is given, cannot be accepted, according to the s
because the direct and indirect risks associated with the
intervention are too numerous compared with the ver
advantages that can be obtained with splenectomy.

Professor Diamare.—The national award of the Academ
Lincei for biologic sciences was conferred on Prof. V
Diamare, who holds the chair of histology and general
ogy of the University of Naples. His studies cover all
biology and particularly endocrinology and comparati
phology of the pancreas and of the adrenals. Professor I
first described the morphological importance of the ins
sue as a structural element completely independent fr
exocrine zymogenic tissue of the pancreas. These Im
studies paved the way for Banting and Best to discover

lways be on the spot to deal with them, and at any rate the naller sanatoriums cannot expect to have such specialists on ıeir staffs.

'**omosexual Rate in Sweden.**—Kinsey's observation that in the 'nited States more than one male in three has a homosexual :cord is greeted by many Europeans with the question: Are s conclusions *valid anywhere outside the United States?* Dr. engt J. Lindberg and Dr. Greta Tessing-Ericsson of a psy- ıiatric hospital in Gothenburg have sought an answer to this ıestion, with respect to Sweden, by undertaking a special study : a consecutive series of 100 male patients during 1951. These en were questioned with special reference to homosexual pro- :nsities and experiences. That they answered frankly may be sumed from the honesty with which 86 of them admitted to ıving practiced masturbation at some time or other (the mastur- ıtion rate coincided with that of earlier observations). As many 60 had experienced homosexual invitations or gestures from her persons, but there were only five who admitted to homo- xual tendencies or acts in themselves. Even among this small ımber there were one or two who did not strictly fit into Kin- y's definition of a true homosexual. It may, of course, be ıjected that males attending a psychiatric clinic are not repre- ntative of Sweden as a whole in the matter of homosexuality, d it may well be that other groups in the community will ve to be studied before Sweden can claim that Kinsey's find- gs of homosexuality in 37% of males are not applicable to 'edes. With these reservations Dr. Lindberg and Dr. Tessing- icsson conclude that "this investigation undoubtedly shows at we are not entitled without more ado to apply to conditions Sweden the high frequency rate of homosexuality which nsey has found in his material."

curisy Risk After BCG Vaccination.—Two members of the ıff of the Serafimer Hospital in Stockholm, Dr. Gunnar Dahl- ım and Dr. Hans Difs, have undertaken a statistical and llow-up study of recruits found on entering the army to be perculin-negative. Among them were 36,235 who were vac- ıated with BCG and 25,239 who were not thus vaccinated CG vaccination is not compulsory in Sweden as it is in Nor- ıy). The two groups were strictly comparable, and the recruits t vaccinated with BCG should therefore serve as controls for : vaccinated group with respect to the subsequent develop- :nt of tuberculous pleurisy. Exudative tuberculous pleurisy ıs classified according to whether it was primary or secondary some other tuberculous lesion. The main interest attached to : primary cases, the secondary cases being numerically in- ;nificant. The cases of pleurisy were also classified according whether it developed early, before the BCG vaccination could expected to prove effective, or at a later stage, i. e., 180 days more after BCG vaccination. During the first of these periods, e., up to 180 days after the vaccination, there was no statis- :ally significant difference between the pleurisy rates in the two oups. During the second period there was a statistically sig- ficant difference in favor of the vaccinated group. It could : claimed that for the two periods together the pleurisy rate the BCG group and the control group was 1:2.8, whereas for e period dating from 180 days after vaccination, the differ- ıce in favor of the BCG group was as great at 1:5. These find- gs confirm those published in 1947 by Savilahti, whose ıaterial consisted of Finnish recruits belonging to the 1925-1926 asses.

'**ealth Control of Hospital Staffs.**—Some time ago a physician n the staff of a large hospital in Lund was appointed personnel ıedical officer with responsibility for the supervision of the ealth of the staff. Beds were put at his disposal for acute cases f illness among the staff, and he had to keep a health record f every member of the staff. This system is most useful in pre- enting the spread of infectious diseases, tuberculosis in par- cular, and it has been found to be effective in reducing the ckness rate in hospital. With the Lund hospital as an encour- ging example, Prof. Sune Genell, in charge of a large hospital ı Malmö, tried to reduce his own hospital sickness rate, which 'as double that of the Lund hospital. From 1949 onward he ıade a special study of this problem and repeatedly advocated lans for solving it on the Lund hospital lines. His recent resig- ation from the Malmö hospital was provoked by the passive bstruction he experienced and by his failure to achieve what he considered as a legitimate and much needed reform. In a statement issued to the press, he not only gives particulars about this incident but also discusses the wider aspects of a very old difficulty—that of bringing into line the conflicting interests of physicians and lay administrators.

DENMARK

Services of the Danish Medical Association.—From time to time the headquarters or Central Committee of the Danish Medical Association publishes in its weekly journal a detailed account of the many problems it is called on to solve. This survey is a useful reminder to the members of services rendered. To maintain closer contact with its branches, the association recently canvassed them with regard to the suggestion that it should send one of its staff to attend their meetings. Most of the branches thus canvassed endorsed this suggestion and issued a standing invitation to their meetings.

Here are some samples of the questions the association is expected to answer: One of its branches raised the question of BCG vaccination by nurses instead of by physicians, a choice that the association could not endorse. Another branch wanted to know if health insurance funds should be called on to defray the cost of brassières as if they were bandages. It was ruled that brassières should be paid for in this way only under exceptional circumstances and when there was a medical indication for them. In an open letter to the association a physician complained that its journal had refused to publish an article by him on nature healing and pulmonary tuberculosis. In the reply to his protest he was reminded that the correspondence columns of the journal bore witness to the liberality with which the editor published opinions he did not himself hold. But in this case, the physician had aired his opinions effectively in the daily press, and if everyone were to be given free access to the association's journal, what need was there for a discriminating editor at all? Another physician complained to the association of the numerous and urgent requests he received for the induction of abortion. He wanted to know what might happen to him if he passed on such a request to the police. The association replied that it was not in a position to act as a brake on such requests, which must always be met by scrupulous attention to current regulations. To refer such a request to the police would be illegal.

Another physician asked how he should answer the police when they requested him to hand over certain roentgenograms. He was advised to ask by what right this request was made and to refuse it without the patient's consent unless the police were backed by the law. A less serious problem was raised by another physician, who sent a newspaper clipping showing a parade of doctors and clergymen about to oppose each other in a football match. The physicians were dressed as for an operation. On this cutting was scribbled: "Is it possible?" The association, having weighed the pros and cons carefully, replied that it was possible.

In another case, the Danish public health authorities requested the opinion of the association on a complaint by the Danish Dental Association that certain physicians were devoting most of their time to dental extractions with the use of anesthesia on behalf of dental technicians. The association replied by referring to the law according to which physicians must not practice dentistry as their main occupation if they have not passed special examinations in dentistry. The association warned against such teamwork between physicians and dental technicians. It may be added that the peccant physicians in this affair were not members of the Danish Medical Association. The association is also often called on to give rulings concerning income tax. In one case, for example, a physician disagreed with the income tax authorities over his motoring mileage. How much of it was his private concern and how much a matter of medical practice? To which the association replied that this question is a hardy perennial, the answer to which is: "Keep separate accounts for the two." Another recurrent problem concerns medical certificates, and the latest version of it has to do with pregnant women needing certificates of their pregnancy to give them priority claims on railways and trams. The association did not wish to promote this plan. Many other examples are cited to illustrate the character of the work undertaken by the association on behalf of its members.

CORRESPONDENCE

MISSION MEDICAL SERVICE

To the Editor:—The tremendous physical and human needs of Asia, Africa, the islands of the Southwest Pacific, and the interior of Latin America are still far beyond the resources of all the combined government and private agencies. There is almost an unlimited job to be done. From every corner of the globe come appeals for more medical missionaries. In most areas government attitudes and regulations are favorable; in a few, such as Latin America and Turkey, the conditions of licensure are almost prohibitive; in others, like India, there are signs of relaxing the conditions of professional registration.

Medical missions have always tried to cooperate with the best in government programs. So far as is practicable and without impairing our essential Christian purpose, we wish to assist and supplement the constructive efforts of governments and the World Health Organization. This might be in cooperative planning in hospital facilities for a district or province, acting as the center for a community health program, offering internships to graduates of government medical schools, and other ways. In some areas missions have led the way in special fields, such as leprosy and tuberculosis. This might be extended to the care of the mentally ill and those suffering from chronic incapacitating diseases.

The vast majority of medical missionaries are assigned to general hospitals for general surgical and medical work. These hospitals present a great range in size, and in quality of equipment. Most of them are located in towns, some in small isolated places, and a few in large cities. The bed capacity runs from 50 to 200, with an average of about 70. A considerable majority are fairly modern, having running water, electricity, x-ray machine, a fair laboratory, a well-equipped operating room, and modern hospital beds. Very probably there is a school of nursing, and perhaps a few interns. The trend is steadily toward improvement of the facilities and quality of work.

In a broad sense all of the missionary physician's work should be medically educational. Increasingly in some areas the smaller hospitals are working out ways of cooperating with Christian medical schools. There were nine such schools of medicine in which North American Boards were cooperating, until China was closed and Korea devastated. Now there are three in India and one being planned in the Philippines, with a medical training institute under construction in the Congo. In these institutions and in the larger union hospitals linked to them there is scope for practice of the major specialties—orthopedic, thoracic, and neurological surgery, internal medicine, pediatrics, gynecology and obstetrics, clinical pathology, and the preclinical sciences. There is a steadily growing attention to organized public health —preventive and constructive. School and community health programs have been developed in some areas. For such, a full public health course would be essential; while, for those taking charge of a mission hospital, a short, intensive course, combining public health and tropical medicine, is highly desirable.

The candidate must be a graduate of a Class A medical school. An internship is, of course, essential. This may be a straight internship for the few who are definitely looking forward to a teaching or special assignment. For the majority a one or two-year rotating internship in a hospital with a good educational program is highly desirable. On the whole, the large city or municipal hospital with teaching connections probably offers the best type of service for the prospective medical missionary.

Since most medical missionaries have to do some surgery, and some a considerable amount, with a rather extensive repertoire, it is desirable to secure the advantage of at least a one-year surgical residency, if possible. For those planning to specialize in some particular branch, of course, residency service of three or four years is essential. Internships and residencies on the field are not feasible or desirable. There are very few setups on the field where this would be practicable. Specialty board diplomas are becoming increasingly important for those assigned to medical school faculties, although not yet recognized officially by governments.

The value of a formal course in tropical medicine—lon months) or short (four months)—varies with the area to wh doctor is appointed. For service in Central Africa it const "a must." The Belgian government requires it of those ass to the Congo. For those expecting to serve in subtropical a short intensive course in tropical medicine is highly desi Since tuberculosis is a serious problem in most areas s training in this branch would be of great value.

Everyone should secure a license to practice in one or states. As between state board and national board examin the latter are preferable because of the wide application diploma here and because it will be more generally reco abroad, if ever needed.

Ordinarily it is not wise or practicable to concentrate one line before going out the first time, but it is desirable some work in one or more of the important specialtie stetrics and gynecology, pediatrics, skin, eye, ear, nose and and orthopedic, thoracic or genitourinary surgery.

Some foreign mission boards or their denominational of education have funds from which a limited number o fide medical missionary candidates may receive grants r from $300 to $800 annually, which the recipient is expe repay if he does not get out to the field.

With some candidates, debts or heavy insurance obli are a serious deterrent. The average single salary is abou month, which varies with different boards and in differen This is doubled for a married couple. Then there are generous children's and other allowances, which usually of a rather comfortable level of living on the field.

The choice of field and final assignment is a resultant applicant's preference and the mission board's opinion needs and qualifications. The appointing society is ge anxious to reconcile the personal wish and the greatest ness. One cannot always look forward to being place definite job in a definite place. In some instances it is pos carry this out, beginning within a year of sailing. In ge missionary is appointed to an area or mission and not to a station. The final decision regarding stationing rests w mission on the field in conference with the individual con

A medical missionary's work should be considered as long service. Temporary work cannot hope to make a like the contribution that long service can do. The acq of the language, knowledge of the people, as well as and professional experience, all mean greatly accumulati fulness after the first few years. A few special short-term a ments are occasionally made to meet exceptional situatio there is no regular provision for such appointments.

DENIAL OF PSYCHOLOGICAL IMPLICATIONS OF AIR ATTACKS

To the Editor:—In his article "Nature of Air Raid Cas (*J. A. M. A.* **147**:858 [Oct. 27] 1951), Dr. Cortez F. Enlo it questionable to take protective measures such as psy first-aid stations in case of impending catastrophe. I mu tradict this statement and its dangerous implications on th of personal experiences. His statement is only relativel so far as the immediate impact of initial bombing does no increase of psychotic reactions. However, this is dependent kind of population, the training and preparation of the tion, and the skillful training of physicians and psychiat face those catastrophic circumstances. We may expect lowing types of reactions:

1. *Anticipatory Fear Reactions.*—Rumors, false alarm bad organization of civilian defense may provoke all ki panicky reactions. The experiences during the *Orson* panic after his broadcast on the "Invasion by *Mars*" impressed deeply on our minds.

2. *Fear Incubation.*—Many of the fear reactions will come the fore after the impact of the calamity, sometimes months er.

3. *Paradoxical Fear Reactions.*—The psychoneurosis may cur after the cessation of tension and danger in the period of ative calmness.

4. *Disguised Fear Reactions.*—Disguised fear may deny the istence of psychological implications and manifestations. Fear ticipation and unbearable tension may be expressed in a stream psychosomatic complaints or in certain unsocial attitudes like athy, rebellion, escape reactions. Those disguised fear reacns may influence the leaders and their decisions.

5. *The Uncertain Factor of Morale.*—Mass panics occurred ring the first and second world wars and will occur during an entual third world war. It is difficult to determine how strong emotional backbone of a population is, but, when medical d psychiatric staffs are unprepared for it, the confusion and astrophe will be greater.

6. *Fear Infection.*—The influence of certain personalities in o panic may be contagious and disastrous for their environnt. They may show the varied symptoms of the battle neuro. They can be treated instantaneously in order to prevent their luence on others.

7. *Psychiatric First Aid.*—Simple rules about psychiatric first under those circumstances are listed in my article in the *nerican Journal of Psychotherapy* for July, 1951.

Great Britain and Holland—the field of my experience—has own how well trained and prepared populations and medical ffs can take the catastrophe.

JOOST A. M. MEERLOO, M.D.
(Former Chief, Psychological Branch,
Netherlands Army)
162 W. 54th St., New York.

GENIC STERILIZATION, 1950

the Editor:—Sexual sterilization, as a method of prevention the transmission of mental deficiency, psychosis, or other editary disease, was provided under state laws for 1,526 pants in 1950 (Publication No. 5 of the Human Betterment sociation of America, 2 E. 103rd St., New York 29). This is light increase over the 1,500 reported in 1949 (J. A. M. A. :783, 1950). The greater frequency of direct inheritance of ntal deficiency probably accounts for the fact that the larger portion, 62%, were for this cause. Mental disease was the ief cause for 34% and other reasons for 3%.

The largest number, 295, was reported by North Carolina, lowed by California (275), Georgia (226), Virginia (204), and va (113).

North Carolina was also the leading state when population considered, with 7.3 eugenic sterilizations per 100,000. The es for the other states are shown in the chart. States having rilization laws which were not applied in 1950 are Arizona, aho, Mississippi, Montana, Oklahoma, and West Virginia. The erage for the 27 states with sterilization laws was 2.5.

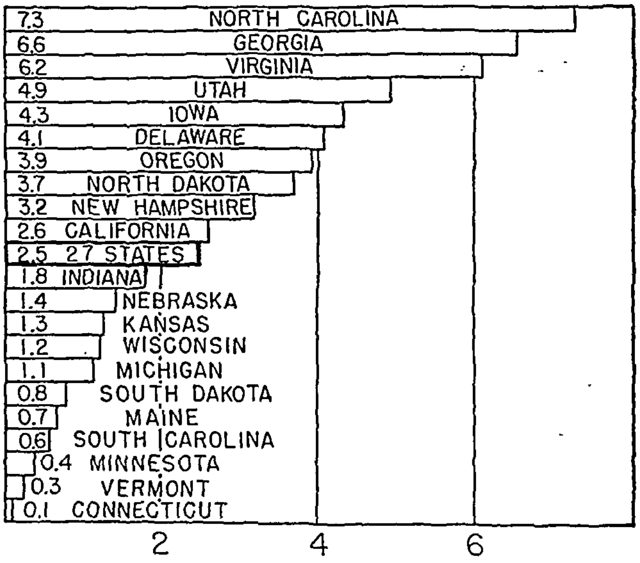
Sterilization of females under the state laws is usually done salpingectomy. Some laws specify this method; others limit e procedure to one which will not "unsex" the patient. Since e uterus will perform no further useful function in a sterilized oman, Williams, Jones, and Merrill (*Am. J. Obst. & Gynec.* :423, 1951) argue that hysterectomy is to be preferred to mple salpingectomy. They base this on the finding that 24% 200 patients subjected to salpingectomy later had disorders the uterus. These did not result from the sterilization but uld have been avoided had the protection been given by sterectomy.

They conclude: "In view of the very low mortality and mordity resulting from simple hysterectomy in the absence of disrtion of pelvic anatomy, it is our impression that hysterectomy ther than tubal interruption should be considered in those dividuals with chronic or progressive diseases warranting deruction of the reproductive function. Procedures short of ysterectomy preserve only the menstrual function of the uterus and leave an organ that is, as far as is known, not only worthless, but potentially dangerous."

Dissatisfied with the occasional failure of the Pomeroy and the Madlener methods of salpingectomy, Irving recommended (*Am. J. Obst. & Gynec.* 8:335, 1924) burying the tips of the uterine portions of the cut tubes in the myometrium. Recently (*Am. J. Obst. & Gynec.* 60:1101, 1950) he recorded 814 such operations by members of the Boston Lying-In staff with no failures. The article gives excellent diagrams of his technique.

The mortality of human sterilization has recently been discussed by Butler and Gamble (*Am. J. Obst. & Gynec.* 62:420, 1951). Five deaths, or one in 597, followed 2,984 salpingectomies of mentally deficient persons at the Sonoma State Home. Vasectomy of 2,439 resulted in no mortality. The loss of expected life is calculated to be 17 days for each patient protected. A lower mortality is anticipated in the future.

The accomplishments of sterilization are suggested by a calculation of the cost of keeping in institutions until 1950 the 25,903 mentally deficient persons sterilized under the eugenic laws of 29 states (*Am. J. Ment. Deficiency* 56:192, 1951). To do this would have required more than 336,000 patient-years and 117 million dollars. From the preinstitutional birth rates of those sterilized in New Hampshire and the proportion of their children found to be feebleminded, it was estimated that those sterilized in the 29 states would, if unprotected, have produced 19,000 mentally deficient children. Estimated costs and numbers of mentally deficient prevented are given for each state.



Sterilizations reported by state institutions in 1950, per 100,000 population.

Most laws for sterilization of the mentally deficient at governmental expense require a petition followed by consideration of the case by a hospital or eugenics board. A supplementary law in Indiana, passed in 1931 and improved in 1937, is commended by Harshman (*Am. J. Ment. Deficiency* 55:377, 1951) for its simplification of the necessary procedure. It requires the examining physician to decide whether sterilization is indicated for the welfare of the patient and of society. With this report as a guide, the committing judge may authorize protection from parenthood. Of the sterilizations recommended by the physician, 77% have been authorized by the judge.

Reports from Japan indicate that sterilization is being extensively employed. In 1950, 11,403 such operations were done under the Eugenic Protection Law (*Japan Planned Parenthood Quarterly* 2:5, 1951). Of these, 273 were compulsorily performed, 85 of them on males. Done at the discretion of the physician were 235 for eugenic reasons, 103 for leprosy, and 10,792 for health causes.

In the first six months of 1951, there were 7,487 sterilizations reported, an increase of 31% over the rate for 1950.

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ABSTRACTS

Rebates: Criteria for Illegality.—This was an action to restrain the defendants, five physicians and a layman, from violating the law regulating the practice of optometry. From a judgment in favor of the defendants, the plaintiff, State Board of Optometry, appealed to the Supreme Court of Arkansas.

Early in 1950 the defendant Keller and five oculists formed a partnership to engage in the wholesaling and retailing of optical supplies and the filling of prescriptions under the name of "The Medical Arts Optical Service." The partnership bought the property and equipment of American Optical Company in Hot Springs, with which Keller had been associated since 1932. The evidence shows, in relation to the operation of the partnership, that the examining oculist would determine any deficiencies in a patient's vision and note on a prescription the type and power of corrective lenses and facial measurements for the correct size of frames. The patient then would take the prescription to the Medical Arts Optical Service, or any other optician of his choice, to be filled. When taken to Medical Arts, Keller displayed different styles of frames to the patient and, where the physician or oculist had requested it, he, Keller, checked or verified the facial measurements. If he discovered what he conceived to be an error, he notified the oculist who, after rechecking, made any corrections necessary. This final decision always rested with the oculist or physician and not with Keller. After final instructions from the oculist, Keller had the lenses ground in accordance with the prescription and affixed to the frame style selected by the customer. All that remained to be done, after actual delivery to the patient, was to see that the glasses fit comfortably, which service Keller performed. In some cases, the bridge pinched or the nose hook needed adjusting, in which event Keller, by bending the offending parts, made it comfortable. The Supreme Court held that the above simple acts which Keller performed did not amount to the "dispensing and adapting of the glasses" and "lenses" within the meaning of the definition of optometry contained in the optometry law. The plaintiff board, however, contended that the defendants were violating the Unfair Practices Act and that the Chancellor who heard the testimony erred in refusing to allow the plaintiff to produce testimony on this issue.

The Unfair Practices Act provides "The secret payment or allowance of rebates, refunds, commissions, or unearned discounts, whether in the form of money or otherwise, or secretly extending to certain purchasers purchasing upon like terms and conditions, to the injury of a competitor and where such payment or allowance tends to destroy competition, is an unfair trade practice and any person, firm, partnership, corporation, or association resorting to such trade practice shall be deemed guilty of a misdemeanor and on conviction thereof shall be subject to the penalties set out in section 11."

The complaint, said the Supreme Court, does not allege that the rebates or "kickbacks" were "not extended to all purchasers purchasing upon like terms and conditions, to the injury of a competitor." In fact, the Supreme Court continued, the complaint in effect alleges the contrary. The partnership contract was made a part of the plaintiff's complaint and this agreement specifically provided that "the partnership shall maintain an establishment list of wholesale prices, subject to change from time to time, and shall charge a standard dispensing fee for filling prescriptions. Customers having prescriptions filled shall be charged a retail price to be established by agreement among the partners. The difference between the wholesale price plus dispensing fee and the retail price shall be credited to the oculist making the prescription. Such credit balance due oculists shall be paid by the partnership monthly. The privilege of participating in such retail profits shall be open to all licensed oculists and shall not be restricted to the partners." In construing this statute, the Supreme Court, in a prior case, said "But the regulatory law . . . not forbid all rebates, nor does it make illegal all agree for rebates. Before any agreement for a rebate can be sa violate the provisions of this act, such rebate must: First secret; second, not be paid to all patrons upon like terms conditions; and third, must tend to destroy competition. It volved upon appellee to show that all these requisites of gality existed." We hold, concluded the Supreme Court, that plaintiff board failed to state a cause of action against the fendants on this issue of rebates and therefore the Chanc did not err in refusing to hear testimony on this point. Acc ingly the judgment of the trial court denying the plaintiff's req for an injunction was affirmed.—*Arkansas State Boar Optometry v. Keller, 239 S.W. (2d) 14 (Arkansas, 1951).*

Workmen's Compensation Act: Employee's Right to Sue Malpractice.—The plaintiff sued to recover damages allege have resulted from the malpractice of the defendant physi From a judgment in favor of the defendant, the plaintiff app *to the Appellate Court of Illinois.*

The plaintiff sustained an injury in the course of his emp ment with the Pinckneyville Mining Company, for which made a settlement under the Workmen's Compensation Act to the filing of this action. The evidence showed clearly that the employer and the employee were operating under the visions of the Workmen's Compensation Act. The evid further showed that the defendant was also under and su to the Act. The defendant therefore moved for dismissal on ground that the plaintiff had no legal capacity to sue.

Section 29 of the Illinois Workmen's Compensation Act vides that where all the parties are under and subject to the the plaintiff employee has no right of action as against the n gent third party and his right of action is transferred to his ployer. It appears from the record that a compensable in under the Workmen's Compensation Act was alleged to been aggravated by the negligence of the physician of the ployer. Such aggravation, said the appellate court, was not a *injury* but was connected with and became a part of the ori injury. The employer is bound to pay under the Workm Compensation Act for the original injury and all additional bility caused by the malpractice under the authority of the determined in this State. It is therefore apparent from the ord *that* the plaintiff, plaintiff's employer, and defendant, all under the Workmen's Compensation Act and that Secti of this Act applies to the alleged malpractice of the defen Under said Section 29 the plaintiff's cause of action as ag defendant is transferred to the employer of the plaintiff, since the plaintiff did not have the legal capacity to sue, order of dismissal entered by the trial court was proper. Acc ingly the judgment of the trial court in favor of the defen physician was affirmed.—*Duvardo v. Moore, 98 N.E. (2d) (Illinois, 1951).*

MEDICAL MOTION PICTURE

Trick and Fancy Roping: 16 mm., color, sound, showing time 10 utes. Produced in 1951 by and procurable from Vernon J. Kral Productions, Milwaukee.

This film pictures the technic of plain and trick roping can be taught to children in schools and to patients in nee rehabilitative exercise. An important part of the film is dev to a demonstration of a simple way to make a rope for ropin is remarkable for the appealing way in which colorful out backgrounds and cheerful characters are used to engage attention of the audience. Human interest is added by the s of a victim of poliomyelitis who made roping his hobby; this gests many possibilities in educational and rehabilitative grams. It is recommended for nonprofessional audiences of age and for students of physical education and therap exercise.

Inheritance of Manic Depressive Psychosis.—The role of heredity in the etiology of manic-depressive psychosis has often been investigated, but the results have given rise to a variety of interpretations. From annual reports of the Bureau of Census Merrell deduces that manic-depressive psychosis is less common than formerly. This may be explained by the tendency to define manic-depressive psychosis more narrowly, so that disorders formerly diagnosed as manic-depressive psychosis now appear to be classified as schizophrenic, or perhaps involutional, psychoses. Figures on discharges and readmissions confirm the cyclic nature of the psychosis. Evidence that women are more severely affected than men is to be found in the earlier age of onset and of first admission and in the greater proportion of affected women. Data on twins show conclusively that heredity is involved in the etiology of the psychosis. The high incidence among the relatives of persons with this psychosis and the difference in frequency of the psychosis in different populations are further evidence for the role of heredity. The frequency of the psychosis is about the same among the parents, sibs, fraternal twins, and children of patients with manic-depressive psychosis. The best genetic explanation for the data is that of a single autosomal dominant gene with incomplete penetrance.

Prevention of Otitis in Swimmers.—When water enters the external ear canal in a swimmer it may produce external otitis, or if the tympanic membrane is perforated, otitis media. The following factors predispose to such infections: (1) man's lack of biological adaptation to an aquatic environment, i. e., his inability to close the external ear or nares to prevent entrance of water into the ear canal or middle ear, (2) the ability of water to remove the protective mantle of fatty acids from the skin of the canal with consequent elevation of the surface pH from the normal bacteriostatic level of 5.5, (3) irritation of the skin and mucous membranes by chemicals used for purification of the water, (4) the presence of bacteria or molds in the water or in the ear canal, (5) chilling of the body surface, which lowers resistance to the organisms present. Water may be prevented from coming in contact with the nasal mucous membranes and from thence with the middle ear by a proper method of breathing and by use of a nasal clip. It can be excluded from the ear canal by the use of ear plugs made from nonabsorbent cotton, i. e., a form of cotton that has been sterilized but from which the oil has not been removed. It is water-repellent and forms an efficient, nontraumatic cork in the ear canal against the entrance of water. If about four drops of a 25% m-cresylacetate-chloroazodin solution (one part of m-cresylacetate to three parts of chloroazodin in glyceryl triacetate) is placed into each ear and a tight warm plug of nonabsorbent cotton that conforms to the shape of the ear canal is inserted, the result is both a protection against cold water coming into contact with the canal or middle ear and an oily antiseptic, which guards the skin and tends to kill any offending organism that might be activated by the water or brought into the ear in the water. Six cases are reported in which this method proved highly effective. One part m-cresylacetate was used in cases of a mild nature or when the solution was to be used frequently for swimming over short periods of time. Two parts m-cresylacetate were used in the severer infections or when the solution was not to be used too often.

Synergistic Action of *p*-Aminobenzoic Acid and Cortisone in Rheumatoid Arthritis.—The fact that the inactivation of estrogenic hormones by the liver is inhibited by the addition of *p*-aminobenzoic acid, the great similarity in structure of cortisone and the estrogens, and the fact that the major portion of parenterally administered cortisone is inactivated in the body suggested the possibility of inhibiting the destruction of cortisone by the simultaneous administration of *p*-aminobenzoic acid. The 15 patients treated by this method all had rheumatoid arthritis that had proved refractory to other treatment. In the first of the two methods used, patients received full dosage schedules of cortisone acetate until maximum relief of arthritis was obtained, usually for one week, after which the daily intramuscular dose of cortisone was reduced to 25 mg. With this dose, all patients relapsed within a short time. Then the sodium salt of *p*-aminobenzoic acid was given orally in doses of 1.5 gm. every two

The Association library lends periodicals to members of the Association and to individual subscribers in Continental United States and Canada for a period of five days. Three journals may be borrowed at a time. Periodicals are available from 1940 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

An asterisk (*) before a title indicates that the article is abstracted.

hours during the waking period for a total of eight doses, or 12 gm. per day, in addition to the single daily intramuscular injection of 25 mg. of cortisone acetate. When the arthritic manifestations had again been relieved, for variable periods of time, control tests were made by the substitution of a placebo for the cortisone. In the second method, patients were given from the start the combination of cortisone acetate and sodium *p*-aminobenzoate. The results obtained with these two methods were comparable with those obtained by administration of much larger doses of cortisone alone, with the additional advantage of a reduction in side reactions. The additive or synergistic action of these two compounds warrants further and more extensive use of this method in rheumatoid arthritis.

Virus in Regional Lymph Nodes in Poliomyelitis.—A review of previous studies indicates that poliomyelitis virus can be found only irregularly in the regional lymph nodes. The authors of this report performed necropsies on nine patients who died of poliomyelitis and found the virus in the lymph nodes in six. The right axillary lymph nodes were positive in two individuals, the left axillary lymph nodes in three, the right inguinal lymph nodes in two, and the left inguinal lymph nodes in two. Poliomyelitis virus was found once in mesenteric lymph nodes. The pancreatic tissues obtained in these nine cases did not contain detectable amounts of poliomyelitis virus. It is assumed that, during the invasive period, poliomyelitis virus extends from the gastrointestinal tract into lymphatic channels, with outflow into the blood stream and interstitial tissue spaces. From these compartments virus is transported to lymph nodes, where it may be detectable for a period after the stage of viremia.

Osteitis Pubis.—Osteitis pubis is a distinct clinical entity characterized by self-limiting, nonsuppurative osteonecrosis, which usually begins at the symphysis and extends to the pubic bones or, in the severer cases, as far posteriorly as the ischial tuberosities. Of the 116 cases listed in literature, 33 were reported from 1924 to 1946, while 83 were reported from 1947 to 1950. To these, four personal cases were added by the author. The recent sudden increase in the number of cases must be attributed to a better diagnostic evaluation and especially an intensified search for osteitis pubis, which is to be considered as a potential postoperative complication of urological surgical intervention. Osteitis pubis occurred as an aftermath of suprapubic prostatectomy in 68 of the 116 reported cases and as a complication of retropubic prostatectomy in 29. It was observed in only seven cases of transurethral prostatectomy and rarely after other operations in which the bladder was opened suprapubically. It is not presumed to follow uncomplicated perineal prostatectomy. The cases in which osteitis pubis was reported secondary to nonurological surgical intervention, such as herniorrhaphy or symphysiotomy, were nearly all cases of frank osteomyelitis or osteitis pubis complicated by osteomyelitis. The two outstanding criteria of differentiation from osteomyelitis pubis are fever and sequestration, both of which are present in osteomyelitis and absent in osteitis. Occasional cases of osteitis pubis have also been described following external trauma to the pubic region, pyelonephritis, and other nonsurgical causes. Its clinical features are excruciating pain, tetanic contractions of the muscles that pull on the involved portions of the bone, and in many instances complete disability lasting for many months. The roentg logic features differ according to whether the disease is in prodromal, destructive, or regenerative stage. The appear is characteristic and constitutes the most important objec sign in establishing a correct diagnosis. The prognosis of ost pubis is invariably good. There is no mortality, and the he is complete. In the five presumably fatal cases listed in lit ture it is more probable that death resulted from the se infection, which arose from some other source than the ost pubis. Treatment is symptomatic and supportive. Its aim alleviate the pain and to shorten the self-limited clinical co Roentgen therapy, either alone or in combination with methods, accomplishes both. The author recommends that doses of 75 to 100 r be given at triweekly intervals with 20 1 mm. Cu, until the acute symptoms have subsided, an gradually spaced intervals thereafter. A complete reossific of the bone occurs within one to two years.

Malignant Testicular Tumors.—During the 15 year peri 1933 to 1948, a total of 158 patients with malignant testi tumor were treated and observed in the radiation therap partment at the Veterans Hospital, Bronx, New York. O 158 patients, 58 had seminoma, 58 embryonal carcinom teratocarcinoma, and 10 choriocarcinoma. Of the rem eight, there were two with reticulum cell sarcoma, one lymphosarcoma, one with rhabdomyosarcoma, and fo whom the diagnosis was undetermined, because preope irradiation obscured the histopathological picture. All th tients were white, although 12% of the hospital populatio Negro. All but 1 of the 158 patients were treated by su removal of the diseased testicle followed by deep roe therapy to the regional lymph nodes in the abdomen. Rad therapy was given whether or not there was clinical evi of metastases to the abdominal lymph nodes. In cases of noma, as a rule a tumor dose of about 2,000 r was delive the lymph node areas in the abdomen. There were wide tions in the irradiation response of seminoma, ranging complete regression following small doses to persistenc recurrence of the malignant tumor despite intensive irrad therapy. Some radioresistant seminomas may not respo tumor doses appreciably higher than 2,000 r. In other pathological types the tumor dose was approximately 3, The highest percentage of three-year survival periods achieved in the seminoma group. The percentage of thre survival periods in histopathological types other than semi was greatest in the embryonal carcinomas, less in the tera cinomas, and least in the choriocarcinomas. In each pathological group the presence or absence of clinical meta was important in the prognosis. In seminoma it was noted of 22 patients who had no clinical evidence of metastas survived the three year period. Of 27 patients in the other g who had no clinical metastases when first seen, 18 surviv three year period. All of the deaths occurred within th three years following treatment. Hence, the chance of cont survival is excellent after the three year period.

Interpretation of Serial Chest Roentgenograms in Pulmo Tuberculosis.—Because of the assumption that it is possib assess with a great degree of reliability the "activity" of a l from a comparison of two or more roentgenograms o chest obtained at appropriate intervals, 150 pairs of 14 b inch films of the chest of 150 patients with pulmonary tuberculosis, taken approximately three months apart, were studied. These two single posteroanterior roentgenograms of the chest were interpreted independently twice by each of three radiologists and three phthisiologists of considerable experience in their respective specialties. The main observation was that in judging a pair of films for evidence of progression, regression, or stability of disease in patients with pulmonary tuberculosis, two readers are likely to disagree with each other in almost one-third of the cases, and a single reader is likely to contradict himself in approximately one-fifth of the cases. A significant but relatively small part of the error in film interpretation results from variations in technical factors. Disagreements in serial film interpretations are not due chiefly to contradictory evidence produced by the two lungs in film pairs. On the contrary, a reader disagrees with himself or with another reader almost as often in evaluating changes in a unilateral as in a bilateral lesion. When a reader compares a pair of roentgenograms and classes one as more abnormal than the other, the chances are that in approximately 10% of the cases another reader will make the opposite interpretation; and the same reader is likely to completely reverse his original diagnosis in approximately 7% of readings of the same pairs of films. Results to be expected when two readers interpret a set of 100 film pairs and when the set is interpreted independently twice by the same reader are summarized. The inconsistencies in roentgenographic interpretations revealed by the authors' studies do not mean that roentgenograms are not useful, but they must not be taken as the sole criterion of the patient's progress, nor should clinical decisions rest on them alone. Additional procedures, such as multiple projections and fluoroscopies, may add to the reliability of roentgenographic evaluation, and physical examination and bacteriologic studies will reduce wrong diagnoses or prognoses.

Corticotropin and Cortisone in Guinea Pigs with Experimental Tuberculous Infection.—Excessively large amounts of corticotropin (ACTH) or cortisone were administered subcutaneously to two groups of albino guinea pigs. Forty-eight hours after the administration of the drugs was started each animal was infected subcutaneously over the sternum with an inoculum of virulent Mycobacterium tuberculosis. Drug administration was continued in one group of guinea pigs for 14 days and in the other group for 28 days, at which time all surviving animals were killed and necropsy was performed. The effects of corticotropin and cortisone were most evident in the experimental infection of 14 days' duration. The characteristics of the nodule at the inoculation site were definitely altered. Formation of such a nodule was noted, however, in only one-half of the cortisone-treated animals, whereas a nodule formed in all of the animals that received corticotropin. Demonstrable involvement of the various organs by the tuberculous process was less frequent in the animals given cortisone or corticotropin than in the control animals, which received only isotonic sodium chloride solution. The effects of corticotropin or cortisone were less pronounced in the infection of 28 days' duration. In the longer experiment the formation of a nodule containing caseation necrosis occurred in all animals, irrespective of the substance administered. The extent of the tuberculous process in all animals was approximately the same. Significant differences in the animals given cortisone, corticotropin or isotonic sodium chloride solution, in terms of the number of acid-fast bacilli present in the lesions, were not demonstrable on microscopic examination of the tissues. During the periods in which excessively large amounts of corticotropin or cortisone were administered, evidence of enhancement of the experimental tuberculous process induced by cortisone or corticotropin was not obtained.

Arizona Medicine, Phoenix

8:1-84 (Sept.) 1951

*Clinical Application of Cortisone and ACTH in Arthritis and Related Conditions: Methods and Problems. Part II: Side-Effects, Complications, Contraindications, Precautions and Conclusions. O. Steinbrocker, M. E. Ehrlich, M. Silver and others.—p. 29.

Side-Effects of Corticotropin and Cortisone in Arthritis.—Of 140 patients, 72 with rheumatoid arthritis, 27 with rheumatoid-like articular diseases, and 41 with nonrheumatoid musculoskeletal conditions, treated with cortisone and corticotropin (ACTH), in somewhat less than one-third side-effects or untoward reactions developed. Approximately 90% of these side-effects were temporary, quickly reversible on discontinuance of therapy, or of no clinical importance. Glycosuria occurred in 18 patients, edema in 16, and rounding of facial and body contours in 12. Cutaneous side-effects, occurring in 30 patients, included hirsutism, acneform lesions, erythematous eruptions, and purpuric eruptions. Psychic disturbances appeared in 24 patients. Untoward cardiovascular and peripheral vascular manifestations were observed in 15 patients, all but 1 between the ages of 60 and 80. In seven patients thrombophlebitis developed. Six patients exhibited signs and symptoms of a variety of neuropathies. Decalcification of bone or aggravation of preexisting osteoporosis led to a compression fracture of the 11th dorsal vertebra in one patient and to a fracture of the surgical neck of the humerus in another. The vascular complications, the fractures, the psychoses, and the neuropathies were the most troublesome and necessitated interruption of treatment oftenest. The wide variety of actions of cortisone and of corticotropin other than the useful therapeutic effects makes it necessary to administer them with caution. Hospitalization is recommended for the initial period and is imperative for elderly patients and those with coincidental disease. The presence of relative contraindications to the use of these compounds must be weighed carefully against their expected benefit in each case. A balanced final appraisal of their role as practical therapeutic agents, particularly in relation to long-term administration in chronic, musculoskeletal disease, must await further data on the range of clinical effects and possible pathological changes produced by these substances in larger groups of patients during longer periods of observation.

Spontaneous Pneumothorax Due to Diaphragmatic Defect Complicating Pneumoperitoneum Therapy: Report of Case. I. Epstein.—p. 327.

Early Diagnosis of Primary Lung Cancer.—Cytological studies were made of 6,281 specimens of sputum or bronchial secretion obtained from 2,066 patients with chest diseases in whom malignancy was suspected. Of the 2,066 patients, 1,208 had benign chest disease, but in many of these patients the clinical picture of lung carcinoma was simulated by the benign pulmonary conditions. Of the 858 patients with malignant chest diseases, 241 had pathologically proved bronchogenic carcinoma. A positive cytological diagnosis was made in 55% of these patients. When five or more sputum specimens were studied, an accuracy of 90% was reached. At the same time only two false positive diagnoses were made in the first 500 patients studied. In 113 (47%) of the 241 patients with pathologically proved bronchogenic carcinoma, cytological diagnosis was the first procedure to establish a morphological diagnosis; in 111 patients (46%) the positive cytological diagnosis coincided with other ordinary methods in establishing a morphological diagnosis; and in only 17 patients (7%) the positive cytological diagnosis was reported after diagnosis had been established by another pathological method. In these 241 patients a positive cytological diagnosis thus was made oftener and sooner than other morphological diagnoses. The authors believe that earlier diagnoses of cancer of the lungs will be made when cytological techniques are immediately applied to all patients suspected of having carcinoma, to patients with equivocal lung lesions detected by routine roentgen surveys, and as a routine screening procedure to selected patients with cough and sputum.

Survival Period of Patients with Lung Cancer.—Of 443 patients with microscopically proved bronchiogenic carcinoma not operated on, 373 (84.2%) died within two years of the onset of striking symptoms. The remaining 70 (15.8%) lived from two to seven and a half years. This group included 18 who lived three to five years and 7 who lived five years or longer. An additional patient is reported who lived more than 17 years from the time the diagnosis of carcinoma was made. Microscopic studies of sections obtained from 320 patients on whom necropsy was performed showed that the average length of life was longest (14.1 months) in 122 patients with epidermoid carcinoma and shortest (11.4 months) in 72 patients with anaplastic carcinoma, while 126 patients with adenocarcinoma occupied an intermediate position, with a survival period of 13.6 months. As a clinical corollary of this study, and on the basis of an analysis of the results of surgical treatment in 1,251 patients reported from 10 large centers of the United States and England, it is concluded that resectional surgery should be restricted to patients in good physical condition in whom the disease has been detected in a relatively early stage. Surgery is contraindicated in patients with advanced bronchiogenic carcinoma because of the considerable operative risk and the discouragingly poor results. Such patients should not be subjected to surgical intervention on the principle that nothing is lost by the attempt since death is a matter of a few months in any event. The authors' observations in the 443 patients not treated surgically revealed that an appreciable number of patients with bronchiogenic carcinoma lived two years or longer without surgical treatment.

Half-Life of Passively Acquired Antibody Globulin Molecules in Infants.—In this study on the half-life of the antibody molecule in man, Wiener took advantage of a situation existing in certain cases of isosensitization in pregnancy. When a sensitized Rh-negative woman carries an Rh-negative fetus, the Rh' antibodies in her circulation pass through the placenta into the fetus until an equilibrium exists between the two circulations, so that when the baby is born its plasma contains Rh' antibodies equal in titer to the "univalent" Rh antibodies in the maternal plasma. From the curve of elimination of the Rh antibodies in the newborn baby's plasma, it should be possible to estimate the half-life of the Rh antibody molecule in the baby's body. By following the titer of passively acquired Rh antibodies in newborn infants, the author calculated that the half-life of the placenta-passing Rh antibody molecule is approximately 30 days. Evidence is offered that this estimate applies not only to placenta-passing Rh antibodies, but also to other placenta-passing antibodies, and not improbably to serum gamma globulin molecules in general. Studies on the fate of free Rh antibodies in erythroblastotic babies show that these antibodies often are eliminated no more rapidly in Rh-positive babies than in Rh-negative babies. On the other hand, incompatible alpha and beta antibodies, as a rule, are quickly neutralized and eliminated from the body of newborn infants. These observations provide one explanation for the lower incidence of erythroblastosis due to A-B sensitization in comparison with cases resulting from Rh sensitization.

examethonium in Peripheral Vascular Diseases.—Because of e ganglion-blocking action of hexamethonium, it seemed stified to investigate the effects of this drug in patients with ripheral vascular diseases. The 29 patients in whom Finnerty d Freis used hexamethonium included 2 with arterial emolism, 1 with primary arterial thrombosis, 3 with Buerger's disse, 2 with Raynaud's phenomenon, 1 with causalgia, 5 with teriosclerosis obliterans, and 16 with thrombophlebitis. All ere hospitalized during treatment. The authors concluded that examethonium is approximately as effective as paravertebral mpathetic block. The advantages of hexamethonium were its se of administration and extreme potency, permitting more or ss continuous inhibition of neurogenic vasospasm for long eriods. Its disadvantages were the development of hypotension, specially in the erect position, and constipation in a few cases.

teatorrhea Following Use of Antibiotics.—Since the antiiotics aureomycin, chloramphenicol, and terramycin influence wide range of bacteria, are effective orally, and are reputed o be without serious toxicity, they have been widely used. t is now realized, however, that they may produce black tongue, aginitis, pruritus ani, and proctitis. More recently, prolonged liarrhea and pulmonary disease have been observed. The four ases reported in this paper and four previously reported cases stablish an etiological relation between prolonged diarrhea and he administration of antibiotics. Chloramphenicol, aureomycin, erramycin, and penicillin-sulfonamide combinations are the drugs chiefly responsible for this form of diarrhea, which seems to originate in the small bowel. The presence of fat in the stools, the tendency of the diarrhea to be aggravated by fat ingestion, and the relatively mild nature of the diarrhea are features that are commonly seen in steatorrhea from small-bowel dysfunction. Moreover, in 13 cases x-ray findings pointed to the small bowel as the source of the diarrhea, which closely resembles the diarrhea of the sprue syndrome. It is probably due to a deficiency state secondary to the destruction of the normal intestinal flora. The diarrhea responds readily to parenterally administered liver in conjunction with ingestion of B vitamins.

Anterior Poliomyelitis in Pregnancy.—Brehm reports the histories of two patients in whom poliomyelitis developed during pregnancy. The first woman, who had poliomyelitis in July, carried her infant to term in November. The second woman had a premature delivery in the sixth month of pregnancy during the attack of poliomyelitis. Pregnancy does not seem to have any influence on the severity of the disease or the residual paralysis. The degree of spinal paralysis has no serious effect on labor. The lack of voluntary muscular effort does not contraindicate vaginal delivery. Cesarean operation has probably been employed oftener than necessary. There is no reason to terminate the pregnancy prior to term except for indications other than the poliomyelitis. The general consensus that pregnancy increases the susceptibility to poliomyelitis is difficult to reconcile with the fact that the blood levels of estrogen and progesterone are high, which supposedly provides a protection against this virus; on the other hand, pregnancy probably increases the permeability of the upper respiratory tract and produces chronic fatigue. No cases of congenital poliomyelitis have been reported.

Radioiodine in Treatment of Hyperthyroidism.—This is a report on the first 100 consecutive patients to whom radioactive iodine (I^{131}) was given for the treatment of hyperthyroidism at the University of California School of Medicine, San Francisco, since 1945. Patients with nodular goiters and those who were pregnant were not accepted for this form of treatment. As the first step in treatment a test dose of I^{131}, usually 100 μc, was administered orally, the uptake in the thyroid was determined at intervals, and the uptake curve was drawn. From the estimated thyroid weight and the uptake curve for the test dose, the amount of I^{131} necessary to deliver 6,000 beta roentgen equivalents to the thyroid was calculated. This amount was given as an oral dose and its uptake by the thyroid measured in a manner similar to that for the test dose. Thereafter, the patient was examined at weekly intervals. About six weeks after the initial treatment dose, the patient was reexamined, and retreatment was given if necessary. About 12 weeks after the initial therapy dose, an uptake curve was again obtained, and treatment given as indicated. In most cases more than one dose of I^{131} was given. It was hoped that patients could be cured without being rendered hypothyroid by this treatment. While this was not fully possible, the incidence of hypothyroidism was perhaps slightly less than following surgery. The results of radioiodine therapy for hyperthyroidism in patients without nodular goiters were satisfactory. In 89 patients remission was achieved; that is, the signs and symptoms of hyperthyroidism disappeared, the thyroid returned to normal size, and the laboratory findings no longer suggested hyperthyroidism, even though the patient might have hypothyroidism and/or exophthalmos. Follow-up studies of patients up to five years revealed a striking absence of recurrence.

Insects and Allergic Problems.—After citing a death in a boy bitten by ants, Bowen says that the literature describes more than 30 varieties of insects that may cause allergic disease. He lists 25 such species and shows that insects may produce sensitization by scales or dust from wings or body, injection of venom through the sting and the instillation of salivary secretions. In some persons the effect of sensitization is due not to the direct action of the irritant but to an acquired specific sensitization. Some children show a true Arthus phenomenon after being bitten by a mosquito. There is a higher incidence of insect dermatoses in children than among adults. Some persons develop a season's immunity in about 10 days, but react again, although less violently, the following season. This explains why visitors to the West Coast will experience unpleasant bites from fleas, yet the natives apparently are not disturbed. Papular urticaria (lichen urticatus) is especially frequent in infants and children, and occurs particularly during the warmer months. Many children with this disorder have been subjected to skin tests and food restrictions to no avail. A history of similar lesions the preceding year is frequently obtained and is suggestive of allergy to insects. The author believes that allergy to mosquitoes and chiggers is an important cause of papular urticaria, in that of 27 patients 24 reacted to mosquitoes and 3 to chiggers. Se ondary infection is frequent and scabies must be ruled out, p sibly by the use of benzyl benzoate. Some of these children h a dog, and fleas and bed bugs are possible causes of their sk lesion. When skin tests are made for the detection of ins allergy, they should be read in the second 24 hour period, as t immediate reaction may be negative. Moths and caterpillars m produce severe urticaria, occasionally with fatal outcome. Sti from bees and wasps are also sometimes fatal. Aphids and fl are mentioned as possible causes of allergic reactions. Dichlo diphenyltrichloroethane (DDT) and insect repellents are value in the prevention of insect bites. Epinephrine and his mine antagonists are helpful in severe reactions after insect bi

Ovarian Carcinoma Subsequent to Hysterectomy.—During five year period 1945 to 1949, a total of 276 pelvic tumors w removed at one hospital from women who previously had und gone hysterectomy and in whom one or both ovaries had been removed. Nearly all of these 276 tumors evolved from ovary, and nearly every type of ovarian tumor was represent Ten were malignant, and five of these women are already d as the result of the ovarian malignancy. The author stresses t the widely accepted conservation of the ovaries in women und going hysterectomy requires reevaluation. He feels that si ovarian atrophy or cystic changes ensue following hysterecto it is best to combine hysterectomy with a bilateral oophorecto and questions that the patients' future well-being can be defi in terms of freedom from hot flushes. Authors inconsisten observe that ovarian atrophy frequently or even invariably f lows hysterectomy, while at the same time they also adv against removal of the gonads. This "touch-them-not" traditi stems largely from the false premise that women must invaria suffer distress with the menopause. Artificial menopause resu ing from surgery and/or x-rays need be no more distressing th the symptoms of physiological decline in ovarian activity. The is no valid reason for leaving unpredictable organs like t ovaries, which later in life might produce serious disease.

filtrating Epithelioma of Tongue Probably Due to Dental osthesis.—Lingual epitheliomas most frequently result from friction or irritation caused by teeth that are badly placed have sharp edges. Injuries to the sides of the tongue soon e rise to reparative epithelial hyperplasia, which degenerates sily into squamous cell carcinoma. Electrogalvanic currents ginating from metals of varying electrostatic potential used dentistry may cause repeated burns of the buccolingual icosa, giving rise to leukoplakia, which sooner or later deıerates into epithelioma. The authors report a case of infilting epithelioma of the tongue in a woman aged 70 that was parently caused by friction of the tongue against a prosthetic late she had worn since she was 14. They state that such cases ıy increase as a result of ill-considered extraction of the teeth, h subsequent use of prostheses, in an effort to eliminate foci infection.

dioiodine in Thyroid Carcinoma.—On the basis of reports in world literature and their own observations on 10 patients hler and associates discuss the use of radioactive iodine in treatment of carcinoma of the thyroid. This method is espelly suited for advanced cases, in that it permits the simuleous irradiation of the primary tumor and of its metastases. ondary effects resembling radiation intoxication are slight. ere is usually a decrease in leukocytes, but the erythrocyte ınt shows no change. Local reactions are slight, but 4 of the patients complained of burning pains in the skeletal metases as soon as the dose exceeded 10 mc. Some patients comıined of burning sensations of the mucosa of the mouth and conjunctivas, probably the result of the elimination of iodine the saliva and the tear ducts. Therapeutic results suggest that nical cure will be possible in only a few cases, but, in some ses, significant regression has been observed in the size of primary tumor and metastases with corresponding improveent in the general condition. In two of the authors' cases spnea was reduced, probably because of a temporary regresın in the cancer of the thyroid. One patient showed a surpris g improvement of the general condition, with a weight increase 16 kg. Congestion in the head and pressure in the neck lesned, but a measurable regression in metastases was never served. In two patients skeletal metastases remained staınary; however, new metastases developed at other sites in ıe of these patients. Eight of the ten patients had metastases the skeletal system. Only two of these showed a therapeutilly effective uptake of iodine in the skeletal metastases, two hers revealed a slight uptake and four others no uptake. The ses did not reach the optimal level, because the supply of the otope was limited. Increase in the life span or arrest of the ıncer have been reported more frequently than objectively ıeasurable tumor regression, but even with respect to these ıctors longer observation is required for adequate evaluation.

*Calcification of Myocardial Infarct and of Coronary Arteries. N. Botelho Reis and E. Amorim.—p. 503.

Calcification of Myocardial Infarct and Coronary Arteries.—The authors report a case of roentgenologically demonstrable calcification of a myocardial infarct and both coronary arteries. The patient, a 65-year-old man, suffered two attacks of myocardial infarction at the age of 53 and 56, respectively. The last attack was confirmed electrocardiographically. Nine years later he was apparently healthy, except for occasional mild pain of an anginal type. Physical examination of the heart revealed no abnormalities, and blood pressure was normal, but there was electrocardiographic evidence of intraventricular block, and a roentgenogram of the heart showed the above-mentioned calcification. One year later the patient died suddenly of acute pulmonary edema. The authors discuss the roentgenologic differentiation of myocardial and coronary calcification from pericardial calcification, and the clinical and laboratory differentiation from myocardial calcification due to hydatid disease. They say that calcification of a myocardial infarct does not necessarily imply the presence of a ventricular aneurysm.

Cortisone and Corticotropin in Hypopituitarism.—Of five patients with hypopituitarism due to postpartum necrosis of the anterior lobe, three were treated with cortisone and two with corticotropin (ACTH). Two patients were given intramuscular injections of 100 mg. of cortisone acetate daily for 20 days and one patient was given the same treatment for 12 days. There was pronounced clinical and biochemical improvement, though two of the patients became depressed, moody, and very obstinate after about two weeks. After the cessation of the treatment there was a gradual deterioration in the patients' condition. The obstinacy and uncooperativeness gradually lapsed into the passive lethargy of the untreated condition. Of the two patients treated with corticotropin, one was given intramuscular injections of 25 mg. of the drug every eight hours for seven days, and the other was given the same treatment for 15 days. There was a slight clinical and biochemical improvement, but after a few days migraine and hemiparesis occurred in both patients, and one became comatose. It seems advisable that corticotropin be employed only with the greatest caution in the treatment of hypopituitarism.

Treatment of Rheumatoid Arthritis with Hypoglycemia.—Of 72 patients with rheumatoid arthritis treated by induction of insulin hypoglycemia, 59 showed clinical improvement after treatment and 32 showed pronounced improvement, but two months later only 40 were still improved and only 22 were greatly improved, while relapses had occurred in the others. Only seven greatly improved patients appeared to be in complete clinical remission six months after completing treatment. Gain in weight was considerable and occurred in all but three patients. There was a tendency to improvement in the sedimentation rate, but not in the hemoglobin level. Reduction in circulating eosinophils occurred almost without exception, suggesting pituitary-adrenal stimulation. Significant increase in potassium excretion in the 24 hour specimens of urine was observed in four of six patients, and a decrease of more than 50% in the phosphate excretion during the period of hypoglycemia in four of five patients in whom these determinations were made. Of 22 control patients who received physical treatment without insulin therapy, 17 were improved and 3 were greatly improved. A second course of treatment with insulin in hypoglycemic dosage had less effect than the first. In a comparison of the clinical effects of treatment with insulin in hypoglycemic dosage and corticotropin (ACTH), three patients who had responded well to insulin and three patients who had failed to respond to insulin were given short courses of 100 mg. of corticotropin in divided doses for four days and then with doses modified as clinically indicated. The three patients who had responded to insulin reacted excellently to corticotropin, while the other three patients responded poorly or not at all. The fact that the degree of clinical response to insulin corresponded closely to the response to corticotropin again suggests that hypoglycemia may have a pituitary-stimulating effect. From the practical point of view, hypoglycemic therapy may be regarded as having a limited value in tiding the patient over a temporary relapse, particularly if this has been occasioned by some temporary or removable factor. In conjunction with other methods it may help in enabling some mildly affected patients to return to work.

Spontaneous Hypoglycemia in Rheumatoid Arthritis.—Of 80 patients with rheumatoid arthritis treated by inducing insulin hypoglycemia, two women aged 36 and 43 had attacks of spontaneous hypoglycemia shortly after therapy was terminated. The first patient received 24 to 38 units of soluble insulin daily for 13 days. Hypoglycemic reactions occurring on 10 of those days resulted in pronounced improvement in the arthritis that was maintained for five weeks. Three months after the termination of the first course a second course of insulin hypoglycemia was given for five days, on four of which good reactions occurred with doses of 32 to 44 units of insulin. Some improvement resulted. An attempt to maintain improvement by inducing single weekly hypoglycemic reactions with 36 units of insulin given one week after the end of the second course was unsuccessful; because of gastroenteritis, insulin was discontinued. Twelve days later the patient was delirious for four hours during the night. Attacks occurred daily for nine days and were controlled by a high-protein diet with a feeding at bedtime. The second patient was given two courses of insulin, with an interval of four months between the two. On the day after the last insulin treatment, the patient was observed to be sweating and incoherent early in the morning and was later incontinent of urine. A similar attack took place two days later, and both attacks were terminated by orally administered dextrose. Only one further attack occurred, 10 days later after an overnight fast and toward the end of a hippuric acid test. In six other patients who had received similar treatment, daily fasting blood sugar estimations for 12 days after cessation of insulin therapy showed that the maximum drop in blood sugar occurred about the 10th day. It seems advisable to insist on the institution of a high-protein diet with a "snack" at bedtime for three weeks after any course of insulin therapy, for the attacks, though not serious, are distressing to the patient.

*Treatment of Infectious Endocarditis with Aureomycin. Naussac, Blanc, Lehmann and Larbre.—p. 805.

Aureomycin Treatment of Infectious Endocarditis.—The authors treated three patients with infectious endocarditis with penicillin followed by aureomycin. A fall in temperature was always the first sign of the efficacy of treatment with aureomycin. Improvement in the general condition followed: appetite returned, weight was regained, anemia decreased, and a feeling of well- and return of strength was established. Nephritis, which sisted in spite of the treatment with penicillin, disappeared the influence of aureomycin. Cardiac phenomena were stabi in no case did the heart increase in size. Signs of old emb disappeared, and no new ones occurred. Follow-up of th tients nine, eight, and seven months later indicated that had been cured. Infectious endocarditis has two compon one in the blood, the other in the tissues. The first is show septicemia, but septicemia alone does not control the evol of infectious endocarditis. The visceral or tissue compon equally important. Patients often overcome the septicemi the help of the antibiotics only to succumb to the cardi renal inflammatory processes. The antibiotic of choice s be one not only that proves its activity in vitro but that i well tolerated by the diseased tissues. Aureomycin fulfills of these criteria. The authors advocate a two-stage treat Penicillin is used in large doses, 10 to 20 million units in four or eight injections as soon as the diagnosis is lished. The kind used must be plain penicillin, not slow-a These doses are continued for 15 to 20 days, until a to 250 to 300 million units has been given. Penicillin is the continued and administration of aureomycin begun. The doses are 3 gm. for 20 days, then 2 gm. The medicine is in spaced doses, continued until a total dosage of 100 gr been attained (about 40 days). These doses were well tol by the patients, save for slight digestive disturbances a The authors attach great importance, first, to the successi ministration of the two antibiotics and, second, to the ad tration of large doses for a long period.

Gastroesophageal Regurgitation.—In many patients who plain persistently of indigestion, but whose symptoms d fit a known pattern and in whom investigation does not an organic cause, the final diagnosis is, all too often, func dyspepsia. Lawler and McCreath are convinced that in a number of these patients the symptoms are in reality d gastroesophageal regurgitation. In a series of 151 new ca dyspepsia, 45 (30%) were caused by gastroesophageal re tation. In this condition the patient complains of a recu burning, or tight substernal or high epigastric pain, which rises to the suprasternal notch. The pain is that defined as burn by Alvarez and is related not to food but to posture pain comes on when the patient lies down or bends for In about half the cases the pain was felt not only und sternum but also in the back between the scapula, in th half of the chest, in the left shoulder, up either side c sternum, and occasionally behind one or both ears. Abou the patients complain of acid regurgitation into the mout acid fluid often containing particles of food. In the grea jority of patients the discomfort is relieved in a short ti inding up, and it does not occur if the patient avoids lying wn or bending forward within three or four hours of the last al. On the other hand, inflammatory or ulcerative changes y arise and produce additional symptoms. The phenomenon n occur in the absence of sliding or fixed hiatal hernia. A a is made for the early recognition of the condition, because stural treatment relieves the symptoms and, if started in the rly stages, can prevent the development of esophagitis and phageal ulcer.

licylate Action and Pituitary Gland.—The effect of intensive icylic-acid therapy on the urinary excretion of adrenocortical roids led Van Cauwenberge to investigate whether salicylates on the suprarenal cortex directly or through the hypothala- is and the pituitary gland. Experiments were made on rats it had undergone hypophysectomy eight days earlier and on act rats. It was found that the administration of a large dose salicylate to intact rats produces biochemical and hemato- ical signs of adrenocortical hypersecretion, which cannot be served in rats subjected to hypophysectomy. The adreno- tical hypersecretion occurring with salicylate therapy there- e depends on the pituitary.

sinophilia in Allergic Myocarditis and Endocarditis.—Allergic ctions become localized in the joints and especially in the art, its valvular and muscular apparatus and its vessels. After general discussion of eosinophilia in blood and tissues, the hor describes five patients who had characteristic allergic ocarditis or endocarditis. The first patient had coronaritis and ocarditis that began acutely with mild increase in tempera- e and could be demonstrated in the electrocardiogram. It s accompanied by arthritic symptoms. Increase in eosinophils uld be demonstrated only once at the time of the second heart ack and the attack of sacroiliac arthritis. Two other patients d an allergic myocardial lesion, which was diagnosed on the sis of the electrocardiographic aspects and the presence of inophilia. In a fourth patient, there was relapsing subfebrile umatic allergic endocarditis and myocarditis, and in the fifth e afebrile rheumatic focal myocarditis was associated with ical changes in the electrocardiogram. The author stresses it eosinophilia as a characteristic and diagnostic sign for the stence of an allergic disease can be found only when blood aminations are repeated daily or at least at short intervals. single test is not sufficient. This applies not only to allergic eases of the heart but to all allergic processes.

efrontal Lobotomy and Psychotherapy in Malignant Hyper- nsion.—Groen presents a detailed history of a patient in whom alignant hypertension developed as a result of a severe psychic nflict from which the patient could not free himself. Since ither medical nor psychotherapeutic measures had any effect, prefrontal leukotomy was done. The operation had no direct fect on the blood pressure, but it made the patient amenable psychotherapy. A marked decrease in systolic and diastolic ood pressure with considerable improvement in the clinical ondition, eyegrounds, and urine followed. Two years after the peration the patient is alive and at work.

Complication After Blood Transfusion Due to Rh Factor. H. E. Torp and S. Vasli.—p. 1101.

Treatment of Newborn Children of Rh-Immunized Mothers.—Exchange blood transfusion was carried out in 34 out of 41 Rh-positive children born to Rh-immunized mothers, with two deaths, both in infants with grave anemia at birth. None of the surviving children showed any signs of cerebral injury during the neonatal period or, as far as is known, later. Broman says that, while the results of the treatment of liveborn children with erythroblastosis are good, there is as yet no causal therapy to suppress Rh immunization of the mothers, and intrauterine deaths cannot be prevented. In his opinion, routine Rh typing of pregnant women and centralization of the obstetric care of Rh-immunized mothers are necessary conditions for continued improvement of the treatment in this field.

Indications for Prostatectomy and Electroresection in Patients with Prostatic Disorders Complicated by Urinary Retention. A. Perret. —p. 707.
*Aureomycin for Mumps in Adults. F. Schaub.—p. 711.

Aureomycin in Mumps of Adults.—The course of mumps is more severe in young adults, and it also causes more frequent and more severe complications in them than it does in children. The most serious complication is orchitis, which appears in an average of about 30% of sexually mature males and which leads in from one-third to two-thirds of the cases to testicular atrophy and, in cases of bilateral involvement, even to sterility. Pancreatitis occurs in about 8% of cases. Meningitis and encephalitis are comparatively rare complications of mumps in adults, as are damage to the internal ear, oophoritis, mastitis, dacryocystitis, thyroiditis, iridocyclitis, and prostatitis. Until recently only symptomatic measures were available for the management of these complications. Schaub used aureomycin in the treatment of 17 recruits who contracted mumps in the course of an epidemic in a Swiss army camp. Seven of these were hospitalized immediately after onset, whereas the six others had had mumps for several days and already showed signs of complications such as orchitis and pancreatitis. The patients were treated with aureomycin for three to nine days. The total dose ranged up to 20 gm. In a comparison of the patients who were treated with aureomycin with an equal number of patients of similar age range treated between 1946 and 1950, it was concluded that the early administration of aureomycin in epidemic parotitis prevents the development of complications and has a favorable effect on the course of the primary disease. Already existing complications, such as orchitis and pancreatitis, are reduced in severity and subside more rapidly.

*Cortisone in Acute Gout. L. Broide.—p. 1429.

Cortisone in Acute Stage of Gout.—Cortisone and corticotropin (ACTH) have been used in the treatment of acute gout. Corticotropin causes rapid disappearance of acute attacks of gout that is resistant to colchicum, but when its administration is discontinued the attack recurs, either in the original location or in other joints, with increased violence, unless large doses of colchicum have been given with and after the corticotropin. The action of colchicum against gout is reenforced (but not constantly) by the hormone. Corticotropin is a new and valuable weapon against the aspects of gout most difficult to treat: the attack that resists colchicum and the formation of tophi. Cortisone, like corticotropin, stops the attack, but its withdrawal may be followed by recurrence. The disadvantage of cortisone, as compared to corticotropin, is the longer time it takes to act (usually 24 hours). The action of cortisone on gout is independent of its action on the carbohydrate metabolism and appears to result from humoral modifications, similar to those caused by venesection, which act on the collagen and the purine metabolism. The author states that cortisone should not be given to patients with gout who tolerate or react well to colchicum and its derivatives, because (1) it is not always effective; (2) it takes 24 hours to act; and (3) it is expensive. It should be given to patients who do not tolerate or react well to colchicum, but it must be noted that (1) in spite of its spectacular action in certain acute attacks it is sometimes totally ineffective; (2) it is useful only during attacks, and when it is withdrawn new attacks may occur; and (3) the new attacks, which previously would not have been influenced by colchicum, now give way rapidly before it.

Significance of Hypohyseal-Diencephalic System for Water Excretion. W. Koella.—p. 819.

Damage to Peritoneum and Intestine by Hot Irrigation Fluid.—In studies on guinea pigs the effect of hot isotonic sodium chloride solution on the peritoneal cavity was investigated. With temperatures of 60 C and over irreparable damage was produced, such as peritonitis, mesenteric fat necrosis, thrombosis of mesenteric vessels and, as sequelae, hemorrhagic intestinal infarcts and intravascular hemolysis. With temperatures of from 70 to 80 C, necroses of the intestinal wall and ulceronecrotic enteritis developed. These studies were undertaken after a woman died following irrigation of the peritoneal cavity with isotonic solution of sodium chloride at a temperature of about 65 to 70 C. Pathological studies disclosed chronic ulcerative enteritis, which had been acutely intensified by the thermal effect of the irrigating fluid. Perforation followed, resulting in a fatal suppurating peritonitis. From observations on this case and from the animal experiments it is concluded that the temperature of the isotonic sodium chloride solutions used for peritoneal irrigation or to stimulate peristalsis should not exceed 50 C.

Incidence and Forms of Hemopathy Observed in Medical Clinic of Sassari During Period 1945-1950. A. Scanu and G. Negroni.—p. 240.
*Therapeutic Action of Choline in Coronary Atherosclerosis. O. Carere-Comes, G. Sala and A. Sala.—p. 243.
Clinical Contribution to Amithiozone (Tb. 1/698) Therapy in Various Tuberculous Conditions of Respiratory Apparatus. F. Sorrentino and P. M. Assereto.—p. 246.

Choline in Coronary Atherosclerosis.—Nineteen patients with coronary atherosclerosis were given two daily intramuscular injections of 1 gm. of choline hydrochloride supplemented in some cases with daily oral administration of 2 or 3 gm. of choline. The total dose of choline administered varied from 8 to 88 gm. The duration of the treatment varied from 4 to 37 days. The patients' ages ranged from 48 to 74 years. Cholesterol determination, subjective and objective symptomatology, and electrocardiographic tracings were compared with the values recorded before institution of treatment. Dyspnea and anginal pain decreased, disappearing almost completely in 11 patients. The pulse rate decreased from an average of 108 beats per minute to an average of 78 beats per minute. The systolic pressure dropped 20 to 40 mm. Hg in five patients and 5 to 15 mm. Hg in nine patients, it increased 10, 26, and 45 mm. Hg respectively in three patients and was unchanged in two patients. The diastolic pressure dropped 5 to 20 mm. Hg in 13 patients, increased 10 to 20 mm. Hg in four patients, and was unchanged in the others. Diuresis increased. There was a constant and pronounced decrease of cholesterol from an average of 177 mg. per 100 cc. to an average of 128 mg. per 100 cc. Erythrocyte sedimentation rate showed a pronounced decrease. Electrocardiographic tracings presented modifications, especially in the ST segment, which tend normalization. Best results were obtained in the patients w hypercholesteremia was more pronounced before treatment instituted. Considering the rapid and beneficial therapeutic e of choline in patients with coronary atherosclerosis, it is gested that the drug acts to restore the elasticity of the wa the coronary arteries rather than to cause regression of atheromatous lesions.

Single Daily Dose of Procaine-Penicillin in Acute Suppurative Media Compared with Effect of Combination Preparation Dipe J. C. Nielsen.—p. 1057.
Nor-Epinephrine in Blood in Pheochromocytoma. A. Lund and K. —p. 1068.

Therapeutic Action of "Leocillin."—Chemotherapy of c pulmonary affections with poorly vascularized processe large cavities has not been especially encouraging. "Leo (the dihydroiodide of the diethylaminoethyl ester of benzy cillin) has been shown to possess a greater affinity for lu sue and to be eliminated in considerably larger quantities sputum than other penicillin preparations. The authors sa while further experiences are necessary for final conclusi the efficacy of "leocillin," it has effected a change of bact the sputum more effectively than other penicillin prepa and has exerted an extraordinarily favorable curative the amount of sputum being reduced to a degree not pre observed. Further, the larger amounts of penicillin that into the sputum will be able to act in cases in which t a moderate amount of penicillinase in the sputum and i in which poorly vascularized processes are present.

"Leocillin" in Acute Inflammation of Middle Ear.—Niel ports that "leocillin," a penicillin preparation with spe finity for lung tissue, gave excellent results in the treatn 60 cases of acute otitis media. Patients under 7 received units once daily, those over 7 received 300,000 units, whi the dosage given in his procaine-penicillin investigati three-fourths of the dosage given in his dipenicillin Complicating otitis in patients with infection of the res tract is thus cured with a preparation adequate for the nary affection, and "leocillin" treatment of acute otitis tients with simultaneous catarrhal affections cures b otitis and the infection of the respiratory tract.

Relative Importance of Electrokymography Among Methods of tion of Cardiac Pulsation. K. Heckmann.—p. 449.
*Electrocardiographic Changes During Operation for Mitral J. Drewes, S. Effert and F. Loogen.—p. 479.

Electrocardiographic Changes During Operation for *Stenosis.*—On four patients in whom an operation w formed for pure stenosis of the mitral valve, electr graphic records were made before and after the operati during the important phases of the intervention, a con registration being impossible for technical reasons. E the heart, opening the pericardium, and the placing of string sutures exerted no influence on stimulus formati conduction. However, when the contracted mitral val split by introducing the index finger through the left and by spreading of the clamp blades, disturbances in resulted. Whether this disturbance in rhythm is the res mechanical irritation produced when the finger advance the auricle to the valve or is caused by the disturbance i perfusion, because of the brief obstruction of the mitral cannot be said. The change in sinus frequency may resu a number of factors. At any rate, the electrocardio changes suggest the risk of the possible development tricular flutter or fibrillation, and, in order to reduce t it is essential to shorten the intracardiac intervention a as possible.

BOOK REVIEWS

Physical Diagnosis. By Raymond W. Brust, A.B., M.D., F.A.C.P., ssociate in Medicine, University of Pennsylvania Medical School. Introction by Truman G. Schnabel, A.B., M.D., F.A.C.P. Cloth. $4.50. Pp. 4, with 60 illustrations. Appleton-Century-Crofts, Inc., 35 W. 32nd ., New York 1, 1951.

Philadelphia has been noted for many years for the excelncy of its physical diagnosticians, as well as for the emphasis laced in its various medical schools on the importance of learng the principles of physical diagnosis. Also, Philadelphia has roduced in "Diseases of the Chest and the Principles of Physil Diagnosis," written by George W. Norris and Henry R. M. andis, one of the American classics in this field.

Dr. Brust's book is worthy in the best traditions of writing n physical diagnosis. He stresses the importance of accurate istory-taking, without confusing the student with the intricacies f psychiatric case history-taking. The importance of doing a omplete and thorough physical examination is properly acnted. The student using this book will not be burdened with icky physical signs named after long-dead European physicians. or will his mind be diverted from the text by illustrations of ll types of physical defects. The chapter on the mental state nd speech disorders is well done from the point of view of hysical diagnosis, as are those on the nervous system and the nportant cranial nerves.

This textbook is excellent, and, when properly used to complement a thorough and practical course in normal and abnormal ysical diagnosis on patients (not lectures), will do much to roduce students of medicine who have confidence in using their wn senses for the diagnosis of disease. In this day of thousands f laboratory tests, many of which serve only to confuse and all f which increase the cost of medical care, confidence in one's wn ability in physical diagnosis is probably the most precious ossession of a physician.

Meister der Chirurgie und die Chirurgenschulen im deutschen Raum: eutschland, Österreich, Deutsche Schweiz. Von Prof. Dr. H. Killian und . Krämer. Cloth. 24.80 marks. Pp. 232, with 32 illustrations. Georg hieme, Diemershaldenstrasse 47, (14a) Stuttgart O; agents for U. S. A.: rune & Stratton, Inc., 381 Fourth Ave., New York 16, 1951.

The authors present a history of the great institutions teachg surgery in Germany, Austria, and in the German-speaking rritory of Switzerland. Their emphasis is mainly on developents in these countries during the 18th and 19th centuries, hen German surgery rose to world fame. There is also a rather imulating account of the history of medieval surgery and of e origin of the illustrious school in Italy during the 12th and 3th centuries. The long struggle between unscholarly surgical chnicians and "highbrow" but inefficient theoretical teachers f medicine is described. From this struggle evolved the skilled, cientific, modern surgeon.

The master surgeons and teachers of the German-speaking niversities came from such places as Prague, Vienna, Heidelerg, Cologne, Freiburg, Berlin, Zurich, and Bern. Many a member of the older generation of American surgeons will find the iography of his European teacher and a record of his work in his book. The younger surgeons will find the genealogical charts f the German chairs of surgery fascinating and revealing reading; for example, the recently deceased Sauerbruch is shown s an outstanding pupil of von Mikulicz, who was a student of illroth, who in turn can be traced back to Langenbeck.

The history of prominent teachers of surgery in the greater erman universities has been brought up to date. The account nevertheless had to be selective, not only because of limitation of space but also because of the difficulty in evaluating the permanent merits of recent generations, on which time alone will pass further judgment. One wonders, however, why the name of Finsterer was mentioned in a very abbreviated sense and that only politically. This book should make interesting reading for anyone interested in the subject and who can read German.

Oral Rehabilitation: Complete Occlusal Reconstruction, Treatment of Dental Deformities and Related Subjects, The Closed Bite. By Jerome M. Schweitzer, B.S., D.D.S., Consulting Dental Surgeon, Woman's Hospital, New York City. Cloth. $20. Pp. 1161, with 1157 illustrations. C. V. Mosby Company, 3207 Washington Blvd., St. Louis 3, 1951.

This publication is largely a review of the literature on the various phases of oral reconstruction, with a summary and evaluation by the author of the theories and methods presented in each section of the book. The early chapters of the book offer a thorough presentation of the anatomy and physiology of the masticatory apparatus, including chapters on the anatomy of the temporomandibular joint and the muscles of mastication as well as a thorough exploration of the various theories of mandibular movement. There is a discussion of temporomandibular joint radiography and the various pathological conditions encountered in the joint and related structures and their treatment. A large portion of the book deals with a discussion of what constitutes normal occlusion and the vast number of variations from normal seen in the human teeth. Approximately the last 300 pages deal with the indications for, and methods of, oral reconstruction.

There is rarely seen a more thorough coverage of the literature in any one field than is presented in this book. Some 563 authors are quoted, and in many instances several publications by each author are cited. However, this very thoroughness will possibly prove the book's greatest weakness as far as the average reader is concerned, since many old and now obsolete theories and methods are presented in great detail. A case in point is the injection of sclerosing solutions into the temporomandibular joint. Several pages are devoted to the technique of such injections, so that the casual reader might think such therapy entirely acceptable if he did not carefully read the author's further discussion, in which he points out its dangers. To be sure, the author's conclusions in this instance are generally sound, as they are in most other cases; but the book requires careful reading to avoid picking up misconceptions. For these reasons the book is not recommended for cursory reading, but to the critical student of oral rehabilitation it should prove invaluable. The author is well qualified to present his subject and has obviously spared neither time nor work in its preparation. His efforts should contribute much to this specialized field of dental practice.

The Management of Fractures, Dislocations, and Sprains. By John Albert Key, B.S., M.D., Clinical Professor of Orthopedic Surgery, Washington University School of Medicine, St. Louis, Mo., and H. Earle Conwell, M.D., F.A.C.S., Associate Professor of Orthopaedic Surgery, University of Alabama School of Medicine, Birmingham. Fifth edition. Cloth. $16. Pp. 1232, with 1195 illustrations. C. V. Mosby Company, 3207 Washington Blvd., St. Louis 3, 1951.

Although there have been many books published during the past two decades on the treatment of fractures, dislocations and sprains, only three are worthy of note as books of reference. One was first written and published in Austria; a second came out of England; and the third is this splendid almost encyclopedic reference work. One of the two authors, John Albert Key, has not only been an outstanding teacher of orthopedic surgery and a widely known and admired clinician but has contributed much in solid, basic research, carried on in his own laboratories at Washington University School of Medicine in St. Louis, where he is clinical professor of orthopedic surgery, and associate surgeon of Barnes, Children's, and Jewish hospitals. Albert Key is both careful and thorough in all things that he does, and is perhaps the most stimulating and pertinent critic among orthopedic surgeons and surgeons of trauma.

H. Earle Conwell, co-editor with Dr. Key, thoroughly trained in all the disciplines of the therapy of fractures, dislocations, and sprains, for more than 20 years has had a most extensive practical experience in dealing with traumatic injuries as chief of the orthopedic service of the South Highland Infirmary and as consulting orthopedic surgeon or attending orthopedic surgeon to five other hospitals in Birmingham, Ala. In these hospitals he has been responsible for the treatment of the injuries suffered by thousands of employees of the coal mines and steel

---

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated.

mills of the Birmingham area. Thus, we have combined in this book of orthopedic trauma the wisdom that comes of wide clinical experience and extensive laboratory research.

The first edition of this excellent book was published in 1934. In the preface of the first edition Key and Conwell state that the purpose of this text is to furnish a practical working guide in the treatment of fractures, dislocations, and sprains. The first edition as well as all subsequent editions included a separate chapter on the subject of injuries as they are provided for by the Workmen's Compensation laws. There are chapters dealing with fractures of the face and skull and trauma to the brain that were written by specialists in those fields.

The popularity of this book has been no surprise to those who know Key and Conwell. Medical students, surgeons of trauma, orthopedic surgeons, and the orthopedic physicians of the United States armed forces for almost two decades have turned to this reference book when in need of knowledge concerning their most difficult orthopedic traumatic problems. In this edition the authors have deleted many illustrations and have shortened the text in an attempt to make the book less bulky. However, the total volume of this book is very slightly reduced over that of the previous editions, because many new illustrations and much material describing new methods or modifications of old methods have been added. Among the more important changes are those of the modern treatment of compound fractures and adequate descriptions of the use of medullary fixation of fractures of the femur and of the tibia. The changes in this text have been extensive, and the entire book has been reset. This is a textbook that must be in the library of all orthopedic surgeons or surgeons of trauma who wish to have a complete set of the best reference books on the subject of the treatment of fractures, dislocations, and sprains.

Psychological Factors of Peace and War. Edited by T. H. Pear. Contributions by G. W. Allport, and others. Cloth. $4.75. Pp. 262. Philosophical Library, Inc., 15 E. 40th St., New York 16, 1950.

The United Nations Association is to be congratulated for sponsoring and publishing a volume so relevant to the basic troubles of modern times. This book contains 10 specific studies by nine distinguished psychologists on what are perhaps the most important, and to the layman certainly the most interesting, sociopsychological aspects of war and aggressive behavior. Above all, the informed public needs to know more about this attitude and the reasons for it, as is shown in Dr. Eysenck's contribution. He draws attention to the disturbing disagreement between the views of psychologists as compared with those of the average citizen. While the former are almost unanimous in their observations concerning the cause of war, the opinions of the general public are exceedingly confused, revealing at times dangerous irrationality and simplicity of mind. Dr. Hilda Himmelweit (Chapter 8, Frustration and Aggression: A Review of Recent Experimental Work) carries the analysis still further. She points out that the precise nature of the interrelation between frustration and aggressive attitudes, postulated by Freudians as an aggressive instinct per se, needs far more tangible evidence and analytical clarification before definite generalizations can be made. The other studies are connected variations of the same broad theme, and, to the general reader, offer an approach not too often encountered.

Soft Tissue Radiography: Technical Aspects and Clinical Applications in the Examination of Limbs. By Arne Frantzell. *Acta radiologica*, supplementum 85 Translated by Klas Magnus Lindskog. Paper. 20 Swedish crowns. Pp. 103, with 37 *illustrations*. *Almqvist & Wiksells Boktryckeri-A.-B.*, Uppsala, 1951.

This supplement deals with the roentgen examination of the soft tissues of the extremities, without use of contrast media. It includes an analysis and survey of the technical factors involved in producing good soft tissue images. The sources of lack of clarity in the roentgen image are discussed. A number of the author's experimental findings are explained in detail and suggestions for filming are outlined. The reproductions of the roentgenograms are good, especially considering that the soft tissue image is of main interest. This is an interesting exposition of the factors involved in this type of radiography. The book is well written and is a good reference on the subject.

Hospitals: Integrated Design. By Isadore Rosenfield. Progressive Ar tecture Library. *Second edition*. Cloth. $15. Pp. 398, with 303 Reinhold Publishing Corporation, 330 W. 42d St., New York 18, 19

Lincoln Steffens once said, "Nothing is done finally and ri There is not now and never has been, a perfectly run railr school, newspaper, bank, theater and no business is, or ever h been built, managed or financed as it should be and some d will be." Builders of hospitals will, if they follow the plans a suggestions of the author, more nearly achieve the perfect. T author suggests, however, that the changes in technique and c cepts will require frequent revision of the text.

Hospitals, like human beings, develop personalities. It is p fully apparent that many hospitals built during the past dec are the result of a resistance to change of the planners a builders. It is refreshing to find clear-cut reasoning for selec of site, of size, and of type of component units; in fact, fr the hospital's concept to its completion, integration is the k note of this book.

In many hospitals there is a lack of storage facilities adequate provision for personnel, such as lockerrooms and w rooms. There is no guesswork in the author's determinatio such facilities; the requirements are ascertained by sin arithmetic. If frequency of use is any indication of the imp tance of a unit in the integrated hospital picture, two units serve, in future revision, a great deal more attention. Cen service or central supply (an entirely different unit from cen surgical supply) is a unit being established in many more e ing hospitals every year. The other unit is the pharmacy. E year more and more therapeutic agents are introduced, pla greater importance on pharmacy service.

The problem of the small hospital is well handled in chapter, stressing its importance in the over-all problem of h service. Hospitals for tuberculosis and other special institu as well as the integrating of such units in the general hos are well covered in all their aspects. Two interesting cha are "Daylight for Hospitals" and "Artificial Illumination." one discovers the reasons for poor lighting in so many pre day hospitals. The mechanical plant, construction, details ishes, and costs are as well covered as the professional asp The work is profusely illustrated; the plans are clear and fo most part understandable to a layman such as a trustee or ilar interested person. The author's years of experience ar flected in the breadth and scope of the subject. Very few tions and problems remain unanswered. It is a valuable refe work for the architect, the student of hospital administra and the hospital administrator.

La tuberculosis traqueobroncopulmonar. Tomos I y II. Por el Luis Sayé. Con la colaboración de los doctores Alvaro Bence, je Servicio de broncoscopia de la Cátedra de patología y clínica de la culosis de la Facultad de medicina de Buenos Aires, y Diego Fer Luna, *director* del Instituto central de patología general y de la culosis, Buenos Aires. Cloth. Pp. 598; 610, with 1018 *illustrations* torial Guillermo Kraft Limitada, Reconquista 319-327, Buenos Aires,

The authors present an exhaustive text on the various p of tracheobronchial pulmonary tuberculosis from all as pathological, clinical, prognostic, therapeutic, and statistical numerous pages and figures of these two volumes, not incl color plates and numerous tables, attest to the scope of the and the importance of the subject. The first volume con primarily the evolution of tracheobronchial tuberculosis elementary study of the anatomic-clinical nature of the tra bronchial lesions, and the frequency of tracheobronchial t culosis, with the anatomic pathology and general and s clinical features.

Volume 2 deals with tracheitis, tracheobronchitis, and t culous bronchitis. Included are primitive tracheal tuberc the forms of primitive infection, the primitive bronchial ste and tracheobronchitis. Hematogenous tuberculosis is well sented in its many aspects and, finally, primary infection t culosis is covered in all its phases; anatomic, patho experimental, epidemiological, bacteriological, and diagn

The volumes are well prepared, and illustrations are chosen and printed. Written in Spanish, these volumes will a to all conversant with this language. They can be recomme for tuberculosis and thoracologic libraries. The author thoroughly conversant with their subject and have made effort to present all phases of the subject completely.

QUERIES AND MINOR NOTES

PROTOVERATRINE IN HYPERTENSION

To the Editor:—*There have been reports of beneficial results from the use of protoveratrine in the treatment of hypertension. Is this preparation available commercially and if so where can it be secured?*

Dorn S. Hower, M.D., Lewistown, Pa.

Answer.—Protoveratrine is in use at the Massachusetts General and Beth Israel hospitals in Boston in a special investigation of its physiological and clinical effect in hypertension. It has been used both parenterally and orally and at present is being given orally to 25 ambulatory patients (in some cases for over a year) by Dr. James H. Currens, who is gathering data about the value of this particular purified preparation from veratrum album. The drug is not yet on the market but is prepared by Eli Lilly and by Pitman & Moore of Indianapolis for investigative purposes. It gives considerable promise for future therapy and seems to be the best of the veratrum preparations that have been tried.

DIRECT INOCULATION WITH TUBERCLE BACILLI

To the Editor:—*What are the probabilities of direct inoculation through a stab wound of tubercle bacilli? A butcher of cattle infected with tuberculosis, during the course of nine years has received several dozen stab wounds in the legs with a knife covered with blood from tuberculous cows. I should like to know, also, the preferred treatment for a wound in which a known inoculation has occurred.*

J. R. Stacy, M.D., Oklahoma City.

Answer.—There are possibilities, and strong probabilities, that butchers working with tuberculous meat will sooner or later contract the disease, owing to superficial wounds, either from knives or abrasions. The type of tubercle called "anatomical wart" occurs in butchers, and also in physicians and technicians working on tuberculous cadavers. Most of these lesions remain localized and heal without producing generalized disease. However, occasionally systemic disease develops from them. Before the use of streptomycin, treatment was a matter of watchful waiting. Now streptomycin is administered, and the infected part immobilized.

PREGNANCY AND BACTERIAL ENDOCARDITIS

To the Editor:—*A normal pregnant woman (gravida II, para I) last menstruated five months ago. Her first pregnancy terminated normally in 1947. In April, 1949, the patient had subacute bacterial endocarditis, with a positive culture for 10 days for nonhemolytic enterococci, which responded to treatment with a penicillin-streptomycin mixture. The blood culture has not been positive since that time. Splenomegaly and petechiae were present only for a short time during the early course of the disease. A loud harsh systolic murmur developed, maximal in the mitral area and transmitted over the entire precordium. This is still present. Does this woman need regular blood cultures before labor begins? Does she need antibiotic treatment at any time before delivery?* *M.D., California.*

Answer.—If this patient does not have fever and is not ill now or near the time of labor, there is no point in taking blood cultures. However, the patient should be given a penicillin-streptomycin mixture for three or four days before the expected day of delivery and surely for two or three days after the baby is born, because the danger of postpartum infection is great.

RENAL CALCULI IN A YOUNG MAN

To the Editor:—*My son, who is 20, is a patient at an air base hospital. Three weeks ago he passed a renal calculus, causing pain, hematuria, and urinary frequency lasting five days. He is now free from pain, although he does have some hematuria. X-rays reveal several calculi in both kidneys and depositions in the prostate and possibly in one adrenal. What quanitative blood tests would reveal the cause of such a condition in a person of that age? What treatment should be instituted, and what is the status of the possibility of dissolution of renal calculi?* *J. H. Teusink, M.D., Cedar Springs, Mich.*

Answer.—The possibility of hyperparathyroidism should be excluded by blood chemical analysis for calcium, phosphorus, and alkaline phosphatase. If possible, the calculus or gravel that has been passed should be analyzed to determine its exact composition. The treatment will depend on the chemical nature of the calculi. Since they presumably contain calcium, the intake of calcium-containing food, especially milk and milk products, should be strictly reduced. If the urinary calcium excretion, as shown by a Sulkowitch test, continues to be high, the administration of relatively large amounts of aluminum gels as advocated by Shorr and Carter (*J. A. M. A.* 144:1549 [Dec. 30] 1950) is indicated. With this treatment and a high fluid intake, residual calculi may gradually dissolve, if they consist chiefly of calcium phosphate. Urine cultures should be made to determine the presence of possible infection and indicate the appropriate antibiotics. If there is any chemical suggestion of parathyroid dysfunction, x-ray survey of the bones might help. Finally, careful studies should be made of renal function, including serum chloride and bicarbonate determinations, to detect a possible specific distal tubular impairment of ammonia production with secondary hyperchloremic acidosis, osteoporosis, and nephrocalcinosis.

NUMBNESS OF FOREARM

To the Editor:—*I have seen several patients with psychiatric disorders, chiefly of an anxiety nature, who have complained of frequent numbness and "falling asleep" of the forearm and hand, chiefly on the left side, often with onset in the ulnar areas but rapidly spreading to the entire involved area. What is the physiologic explanation of this phenomenon? Is there any specific symptomatic treatment aside from treatment of the primary cause, the neurotic process itself?*

Edward Dengrove, M.D., Asbury Park, N. J.

Answer.—The problem as designated falls into two categories: 1. The primary neurotic process is one that should be treated directly by psychotherapy. Whether this can be handled by psychotherapy in the ordinary sense or a form of psychoanalysis long or brief will depend on the factors of the problem. These can be determined only after a careful examination of the patient by a qualified psychiatrist.

2. As regards the numbness and "falling asleep" of the forearm and arm, chiefly on the left and chiefly in the ulnar areas, it is suggested that a careful neurological examination be done to rule out local disease. This region, as well as its spinal cord connections, is the site of many diseases, and a complete examination should be done. Among other things there is a possibility of a pressure involvement as the person relaxes and compresses this nerve at the elbow. Scalenus anticus syndrome, cervical rib, syringomyelia, and numerous other affections must be considered. Certainly no one would hazard a guess without a careful review. It is entirely possible that some of the symptoms may be functional in origin and may be related to the original neurotic process, but one should be loathe to accept such an explanation until a comprehensive examination has been carried out.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

ABNORMAL SENSATIONS FOLLOWING CEREBROVASCULAR ACCIDENT

To the Editor:—*Is there any cure for paresthesias (pin and needle sensations) of the arm of a man, 75, who collapsed two years ago, apparently owing to a cerebral insult in a sensoric field, and who has since been suffering from these often unbearable sensations continuously (except during sleep) without any motor disturbances? Short-wave, faradic-galvanic treatment (of the contralateral part, too), infiltration of the stellate ganglion, codeine, and infrared and ultraviolet rays have been ineffective. Would procaine hydrochloride given intravenously help? Do you have any other suggestions?*

Egon E. Lustig, M.D., New York.

Answer.—Abnormal sensations following a cerebrovascular accident (thalamic hyperpathia) are most intractable phenomena. Cervical sympathetic block of the contralateral side, or paravertebral block of the second to fourth dorsal sympathetic ganglions on the painful side may help. Centrally acting drugs, such as mephenesin, can be tried cautiously. In this patient, section of central sensory pathways cannot be considered. Procaine hydrochloride given intravenously and very slowly, in 1:1,000 dilution, may give temporary, but not lasting, relief.

MYOCARDIAL INFARCTION

To the Editor:—*Alpha-tocopherol intramuscularly with calcium gluconate intravenously has been used postoperatively to prevent formation of thrombosis. Can these drugs be used for the treatment of acute myocardial infarction? Would they be as effective as heparin? Could the calcium be given orally?*

M.D., Kentucky.

Answer.—Claims made regarding the value of alpha-tocopherol and calcium gluconate for the prevention of thrombosis have not been substantiated by other investigators. The evidence regarding the effect of these substances on the antithrombin level and their importance in preventing clotting of the blood vivo is inconclusive. No evidence has been advanced in the ture to demonstrate that these agents are of any value in treatment of acute myocardial infarction. Heparin and bisdroxycoumarin (dicumarol®) have been demonstrated to produce a pronounced effect on the death rate and the incidence of thromboembolic complications in acute myocardial infarction (Wright, I. S.; Marple, C. D., and Beck, D. F.: Anticoagulant Therapy of Coronary Thrombosis with Myocardial Infarction, *J. A. M. A.* **138:**1074 [Dec. 11] 1948). Although the use of calcium in this regard has no sound basis in experimental or clinical experience, it may be administered orally if desired.

DUODENAL STASIS AND HYPERPERISTALSIS OF STOMACH

To the Editor:—*A well-developed and well-nourished man, 41, has been examined at many famous clinics; the only diagnosis is hyperperistalsis of the stomach, with rapid emptying. The patient may have pain after he eats, relieved by vomiting; if he does not have pain, he may be nauseated, which is also relieved by vomiting. Again, if he does not have a sensation of something in his stomach, he finds the only remedy for his nausea is food. Beef and pork products cause nausea in about 30 minutes to one and one-half hours, but when he vomits he feels better. He cannot eat anything with fat in it, as it will do the same thing. What foods and drugs decrease the emptying time of the stomach? Banthine,® sedation, and belladonna preparations are of no help.*

John F. Rainey, M.D., Anderson, S. C.

Answer.—This patient, in addition to having hyperperistalsis of his stomach, may have duodenal stasis, which may be due to his having low-grade duodenal-ileus from time to time. The inquirer does not mention whether the patient has free hydrochloric acid in the stomach, whether the vomitus is yellow or green, or whether there is evidence of atrophic gastritis.

Since banthine® (beta-diethylaminoethyl xanthene-9-carboxylate), sedation, and belladonna preparations have been tried, it is suggested that the patient assume a knee-chest position for 10 minutes immediately after meals. He should sleep with the foot of his bed elevated 12 inches. These simple measures may relieve his nausea and his desire to vomit. His intolerance for fatty foods suggests a disturbance in the biliary tree and, particularly, a hypokinetic type of dyskinesia in which the gallbladder does not empty, but relaxes, when fats are brought in contact with the ampulla of Vater. This could be easily determined by a cholecystogram. Complete neurological examination, to rule out cerebral pathology as a cause of the interabdominal trouble, is suggested. If clinical improvement is not obtained, an intravenous pyelogram, to discover if there is intermittent hydronephrosis, associated with nephroptosis, may be worth while. Perhaps there is some obstruction to the passage of urine from either kidney. The patient may be given 15 minims (9 cc.) o dilute hydrochloric acid in a suitable vehicle a half-hour afte meals, to overcome the nausea. In the last analysis, the descrip tion best fits that of patient with intermittent duodenal stas bordering on ileus.

EPILEPSY

To the Editor:—*A man, 29, had his first epileptiform seizu while in the army in 1944. He had no more seizures while army. After discharge he completed his last two years of cc lege. He now holds a position requiring much mental effo and concentration. Within the past two years he has h several seizures. Two electroencephalograms were interpret as normal. General physical examination was normal, inclu ing sugar tolerance tests. The childhood history is no contributory. Are pneumoencephalogram and arteriogra indicated?*

M.D., Pennsylvania.

Answer.—A seven year history, absence of neurological a electroencephalographic abnormalities, or symptoms of int cranial pressure argue against an expanding lesion. Absence a history of brain injury, or focal seizures would argue agai any form of organic epilepsy. Therefore, institution of di therapy seems of more immediate importance than the suggest examinations.

BAGS UNDER THE EYES

To the Editor:—*I read all the explanations given by your f consultants in answer to the query on "Bags Under the Ey in* The Journal, *March 17, 1951, page 858. I am of the op ion that another explanation should be added. A few ye ago Dr. Berardinelli, professor of internal medicine at School of Medicine of the University of Brazil, presentec the Academia Nacional de Medicina the following theory*

The "bags" about which Dr. Mandel inquires may be fou also in certain diseases of the biliary tree. This presentat was in December, 1945, and since then this author and so other Brazilian doctors have had the opportunity of confi ing this opinion. Recently a paper by Dr. Berardinelli appea in the French literature. He described a new sign for cholecystopathies: bilateral edema of the lower eyelids.

"The clinical drainage of the gallbladder (by duodenal tubation or a cholecystokinetic medication) reduces the ede may even in certain cases, make it disappear completely. T sign may be able to guide us in those cases in which the cla cal features of the cholecystopathies are not so evident. A from an esthetic point of view, especially in women, kn ing the origin of the edema of the lower eyelids permits us follow an efficient and rational therapy.

"The pathogenesis is obscure: it may have something to with the fact that the eyelids on account of their soft conn tive tissue, are the seat of minimal edemas and by the humo alterations probably present in the cholecystopathies, n induce the bilateral edema."

Figueiredo Mendes,
Av. Rio Branco, 257-18,
Rio de Janeiro, Brazil, South Americ

CORRECTION

Nitrite Instead of Nitrate.—In the answer to the query entit "Isopropyl Alcohol" in The Journal, November 24, page 13 in the ninth line from the bottom of the right hand column word "nitrate" should have been "nitrite."

HYPERTENSIVE CARDIOVASCULAR DISEASE

EFFECT OF THORACOLUMBAR SPLANCHNICECTOMY ON MORTALITY AND SURVIVAL RATES

Reginald H. Smithwick, M.D., Boston

Diets low in sodium and fat, drugs having a sedative hypotensive effect, and surgical intervention on the mpathetic nervous system are the principal measures iich are available at the present time for the manage- nt of hypertensive cardiovascular disease. Since the use of this disorder is unknown, none of these meas- es can be regarded as a specific form of treatment. vertheless, they have all been shown to be of some rapeutic value. Numerous articles have appeared in literature in recent years, dealing with the effects of se measures on blood pressure levels and responses, the cardiovascular system, and on symptoms. There as yet, however, little information concerning the effect treatment on life expectancy. This is due to the fact at it requires a long follow-up of large numbers of nsecutive patients treated in a particular fashion, companied with suitable control data, in order to termine whether the mortality rate has been affected nificantly.

The primary objective of the surgical treatment of pertensive cardiovascular disease was to determine iether the prognosis for these patients could be signifi- ntly improved. Although my own interest in this prob- m extends back over a period of 17 years, it was not itil 1938 that a standardized surgical procedure was lopted after years of trial and error with every con- ivable variation of sympathectomy. Since 1938, ap- oximately 3,000 patients have been referred to me for nsideration of surgical treatment. Of these, approxi- iately two-thirds have been operated on, and one-third ave been treated medically. The majority of these cases ave not been followed long enough to be included in ie discussion at this time. They will be reported on as oon as the duration of follow-up permits. A continuous ollow-up study is in progress. As a consequence, the ata are at all times approximately 98% complete. Less than 2% of the patients have not been followed. The purpose of this communication is to discuss the effect of thoracolumbar splanchnicectomy on the mortality and survival rates of the first 892 patients in this series. They were seen during the years 1938 to 1946, inclusive, and have been followed at least four and at most 12 years.

TABLE 1.—*Mortality Among Hypertensive Patients Not Treated Surgically*

Author	Number of Cases	Time Followed (Yr.)	Mortality (%)
Janeway (1913)	244	5-10	81
Blackford, Bowers, and Baker (1930)	202	5-11	50
Keith, Wagener, and Barker (1939)	219	5- 9	91
Rasmussen and Boe (1945)	100	6	52
Bechgaard (1946)	1,038	4-11	28
Palmer, Loofbourow, and Doering (1948)	430	8 (average)	61
Perera (1948)	250	12 (average)	17
Hammarström and Bechgaard (1950)	435	2-10	51

From this material, together with other data which have accumulated in the literature, it is possible to gather a rather clear impression of the effect of this operation on the prognosis for patients with hypertensive cardiovascular disease.

MORTALITY FOR HYPERTENSIVE PATIENTS NOT TREATED SURGICALLY

From time to time since the introduction of the sphygmomanometer at the turn of the century, physicians have reported on the deaths resulting from hypertensive cardiovascular disease. Starting with the study of Janeway in 1913,[1] additional reports have continued to appear in the literature. Representative of these are the publications of Blackford, Bowers, and Baker (1930) [2]; Keith, Wagener, and Barker (1939) [3]; Rasmussen and Boe (1945) [4]; Bechgaard (1946) [5]; Palmer, Loof-

bourow, and Doering (1948)[6]; Perera (1948)[7]; and Hammarström and Bechgaard (1950).[8] Their findings are summarized in Table 1. A study of these data indicates that the mortality rate for the different groups of patients varies tremendously, from 17 to 91%. While the duration of follow-up also varies, it is apparent that this is not an adequate explanation for the marked difference in mortality rates. A detailed study of these reports as well as of my own material indicates that the amount of cardiovascular disease which exists when the patient is first seen is extremely important for prognosis.

TABLE 2.—*Mortality Rates for Nonsurgically Treated Hypertensive Patients Grouped According to Criteria of Keith, Wagener, and Barker*

	Nonsurgical Series (K., W. and B.)					Nonsurgical Series (Smithwick)				
Group	No. of Cases	No. of Deaths at 5 Yr.	Mortality at 5 Yr. (%)	No. of Deaths at 5-10 Yr.	Mortality at 5-10 Yr. (%)	No. of Cases	No. of Deaths at 5 Yr.	Mortality at 5 Yr. (%)	No. of Deaths at 5-10 Yr.	Mort at 5 Yr. (
1	10	3	30.0	4	40.0	59	18	30.5	22	37.

There is no significant difference in mortality rates between surgically and nonsurgically treated patients in Group 1. The mortality rate fo gically treated Group 2 and 3 patients is significantly lower than that of the nonsurgically treated patients, both for the first four years of observ and for the entire period of observation. The same is true for surgically treated Group 4 patients. The eventual mortality rate for Group 4 pa is high (Fig. 2).

PROGNOSIS FOR HYPERTENSIVE PATIENTS GROUPED ACCORDING TO CRITERIA OF KEITH, WAGENER, AND BARKER

Keith, Wagener, and Barker[3] of the Mayo Clinic were the first to recognize the fact that the prognosis for a hypertensive patient varies according to the status of his cardiovascular system when first examined. In outstanding communication, they showed that the p nosis varied according to the changes noted on exami tion of the eyegrounds. A series of 219 cases was divi into four groups according to eyeground changes, the mortality and survival rates for each group were culated after a five to nine year period had elapsed. patients in Group 1 had mild narrowing or sclerosi the retinal arteries. Those in Group 2 had moderat marked sclerosis of the retinal arteries, character especially by exaggeration of the arterial reflex arteriovenous compression. Group 3 contained pati with angiospastic retinitis, characterized especially edema, cotton-wool exudate, and hemorrhages in retina, superimposed on a combination of sclerotic spastic lesions in the arteries. If measurable edema the optic disks was added to this picture, the case placed in Group 4.

The mortality rates for the 219 cases of Ke Wagener, and Barker are given in Table 2. A simi group of 192 consecutively studied patients who w referred to me during the years 1940 to 1945, inclusi and who were also not operated on is included in t same table. A study of the findings indicates that the m tality rates in the two series for each group are comparable. For this reason, and in order to obtain a larger control series to compare with a similar number of consecutive cases treated surgically, these two control series have been combined, and the mortality rates are compared with those for the surgical series in Table 3. All the control patients as well as those treated surgically were followed for a minimal period of five years and a maximal period of 12 years. A study of the data in Table 3 indicates that the mortality rate for each of the four groups is significantly lower in the surgical series. These same data are presented in the form of survival curves in Figure 1. A thoracolumbar splanchnicectomy, first described in 1940, was performed on all of the patients in the surgical series. These 538 cases were operated on consecutively during the years 1938 to 1944, inclusive. It is quite clear that surgical therapy has significantly prolonged the life expectancy of these patients.

PROGNOSIS FOR HYPERTENSIVE PATIENTS GROUPED ACCORDING TO THE CRITERIA OF HAMMARSTRÖM AND BECHGAARD

In a similar study of a smaller number of cases followed for a shorter period of time, Hammarström and Bechgaard[8] recently reported that splanchnicectomy had significantly modified the prognosis for the severer forms of hypertensive cardiovascular disease. They divided their cases into four groups. Group 1 contained patients with uncomplicated hypertensive cardiovascular disease, and no cases of this sort were operated on. The prognosis for these patients was considered good, as indicated by the report of Bechgaard[5] referred to in Table 1. Group 2 includes those with marked subjective symptoms but without signs of myocardial damage. They may show left axis deviation in the electrocardiogram, and/or a relative enlargement of the left ventricle if the heart volume is within normal limits according to teleroentgenography. The retinal changes in the patients in their second group are classified as Group 1 or 2 according to Keith and Wagener. Group 3 includes those with the same eyeground changes or, in addition, retinal hemorrhages with or without signs of thrombosis of the retinal vessels. Patients in Group 3 further show one or more of the following signs of cardiovascular damage: negative T_1 in the electrocardiogram, heart volume above the predicted normal (500 ml. per square meter of body surface in men, and 450 ml. per square meter in women, or the transverse diameter of the heart greater than one-half the inner thoracic diameter), residual damage after cerebral insult, and constant albuminuria. In Group 4 they include all hypertensive patients with definite retinal exudates and/or papillary protrusion, since they found the life expectancy to be about the same if the patients in this group did or did not have papillary protrusion. Patients with cardiac decompensation at rest, auricular fibrillation, myocardial infarct, or renal insufficiency were not included in the nonoperated series. A few patients in the operated series had cardiac insufficiency and were compensated with digitalis before operation, while another minor group showed renal insufficiency before operation. All of them died, mostly within a year after operation. In order to find comparable patients for a control series, 435 nonoperated cases were selected from 130,000 records of hypertensive patients from various hospitals in Denmark and Sweden. The mortality rates for their two series are summarized in Table 5. The findings are similar to those already referred to in Table 3 and Figure 1.

TABLE 8.—*Classification of Hypertensive Patients*

Criteria for Grouping

Group	Numerical Grade	Other Factors
1	Less than 4	Eyegrounds Grade 0 or 1 No changes in cerebral, cardiac, or renal areas
2	Less than 4	Eyegrounds Grade 0 or 1, with changes in cerebral, cardiac, and/or renal areas; eyegrounds Grade 2, 3, or 4, with or without changes in cerebral, cardiac, or renal areas
3	4 or more	Resting diastolic level below 140 mm.; changes are present in cerebral, cardiac, and/or renal areas, but they do not include the following: (a) Cerebrovascular accident with marked residual (b) Frank congestive failure (c) P. S. P.* below 15% in 15 min., associated with a poor response to sedation
	4 or more	Resting diastolic blood pressure below 140 mm. combined with one or more of the following: (a) Cerebrovascular accident with marked residual (b) Frank congestive failure (c) P. S. P.* below 15% in 15 min. combined with a poor response to sedation Patients with a resting diastolic level of 140 mm. or more

Phenolsulfonphthalein.

The eyegrounds are graded according to the criteria of Keith, Wagener, and Barker. The lowest reading of diastolic pressure during the sedative test is taken to be the response to sedation. Three grains (180 mg.) of amobarbital (amytal®) sodium are given by mouth at 7, 8, and again at 9 p. m. Readings of blood pressure are taken every hour from 7 p. m. to 7 a. m. To be regarded as satisfactory, the diastolic level during the sedative test should fall to 90 mm. or less in patients with resting levels between 100 and 119 mm. For patients with resting levels between 120 and 139, the response to sedation should be a fall to 100 mm. or less. For those with resting levels of 140 mm. or more, the diastolic level should fall to 110 mm. or less. Otherwise the response to sedation is regarded as unsatisfactory.

were referred for study and were operated on. At that time, no satisfactory criteria for operation were available. These 892 patients were studied in a similar fashion, and operation was suggested to them as offering a reasonable or a slight chance for a worthwhile result according to the status of their cardiovascular systems when first studied. The majority of the patients elected to be operated on. Those who decided to follow a medical regimen make up the control series. All cases in both series have been followed for a minimal period of four years and a maximal period of 12 years.

These patients were divided into four groups, using criteria which differ somewhat from those already referred to. The plan adopted is designed to control as many of the variable factors as possible, in an attempt to make the patient material in each group as comparable as possible. Soon we shall be dealing with a much larger number of cases. More groups can then be defined, in each of which every important variable is the same. For the present, the following plan is the best we have been able to devise to deal with the number of cases under consideration. Following a careful study of the cardiovascular system as a whole, a numerical value is assigned to various factors which have a bearing on prognosis. These are summarized in Table 6. The numerical values for each factor present are totaled, and this gives the numerical grade for the patient. Two examples of how to determine the numerical grade are given in Table 7. If the numerical grade is less than 4, *the patient will be in* Group 1 or 2. If the numerical grade is 4 or more, the patient will be in Group 3 or 4. The additional factors which determine the exact group of the patient are given in Table 8.

The mortality rates for the control series are compared with those of the operated series in Table 8. A study of this table indicates that, with the exception of the cases in Group 1, the mortality rates for the surgical cases have been reduced significantly. The cases in Group 1 have persistently elevated blood pressure, with minimal or no eyeground changes and no abnormalities in the cerebral, cardiac, or renal areas. Those in the other groups have increasing amounts of cardiovascular disease. These same data are presented in the form of survival curves in Figure 2.

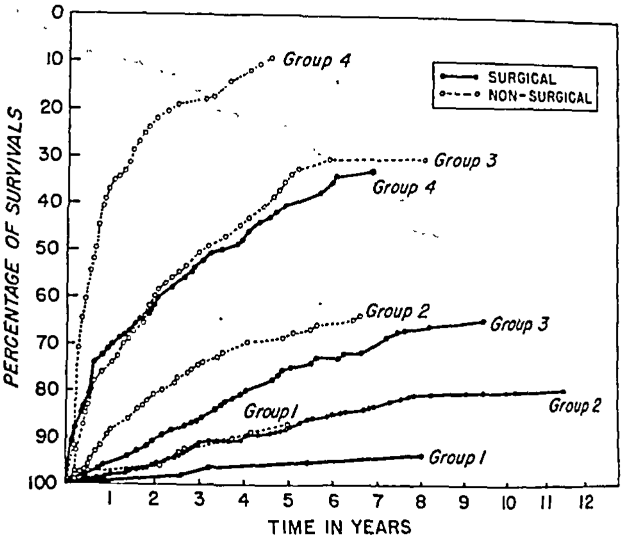

Fig. 2.—Survival curves for surgically and nonsurgically treated hypertensive patients grouped according to Smithwick criteria.

COMMENT

If patients are classified in four groups according to the criteria of Keith, Wagener, and Barker, the findings indicate that the mortality rates have been significantly lowered in all groups following thoracolumbar splanchnicectomy (Table 3, Figure 1). Previously, Woods and Peet [9] had shown this to be true for Group 4 cases.

If patients are arranged in a different fashion into various groups according to the amount of cardiovascular damage in the cerebral, retinal, cardiac, and renal areas, it appears that life expectancy has been improved, as indicated by the findings of Hammarström and Bechgaard (Table 5).

---

[9] Woods, W. W., and Peet, M. M.: The Surgical Treatment of Hypertension: Comparison of Mortality Following Operation with That of the Wagener-Keith Medically Treated Control Series: A Study of 76 Cases from 5 to 7 Years After Operation, J. A. M. A. **117**: 1508 (Nov. 1) 1941.

More recently, White and others,[10] indicated that the prognosis for a small group of 50 patients with the severer cardiovascular changes was much improved after thoracolumbar splanchnicectomy, in comparison to that of a control series of 50 patients with comparable changes who had not been operated on.

If patients are arranged into four groups according to my criteria, outlined in Tables 6, 7, and 8, it is clear that the prognosis for cases in Groups 2, 3, and 4 has been significantly improved by thoracolumbar splanchnicectomy (Table 4, Figure 2). These patients had cardiovascular changes ranging from slight to severe. To date, while the mortality rate is lower for Group 1 cases treated surgically than for the control series, the difference has not as yet become statistically significant. It is expected that it will become so with a longer period of observation. Severe kidney damage, as indicated by persistent evidence of nitrogen retention, is the one finding which positively contraindicates splanchnicectomy in the more advanced stages of cardiovascular disease. The great majority of the patients treated surgically, as well as the controls, were middle-aged. Approximately 90% were under 50, and 80% were between 20 and 49 years of age.

The findings which have been presented indicate quite clearly that the prognosis for patients with hypertensive cardiovascular disease significantly improves after thoracolumbar splanchnicectomy. To date, the best results, when judged both by their significance in comparison to control cases as well as by the eventual mortality rates, have been obtained in cases falling into Groups 2 and 3 (my classification). Surgery may be employed in Group 4 cases, but because the eventual mortality rate is still very high in spite of thoracolumbar splanchnicectomy, it would seem much wiser to utilize surgical therapy earlier in the disease if it is to be considered at all. With regard to Group 1 cases, which are those having persistently elevated blood pressures without changes in the cerebral, cardiac, or renal areas, and with normal eyegrounds or with Grade 1 changes at most, surgery cannot as yet be advocated on a statistical basis. The less the cardiovascular damage, the better the prognosis with or without treatment. Reference to Table 4 will indicate that one-half of the Group 1 patients were operated on, and one-half were not. A longer period of observation will tell whether surgery should be seriously considered in such patients. In the meantime, surgery is utilized in Group 1 patients who are not doing well on medical therapy, or who for one reason or another cannot follow a medical regimen. Surgery is also given serious consideration in Group 1 patients who are young and have high resting diastolic levels, 110 mm. or more. In any case, they should be followed closely for evidence of the development of cardiovascular disease.

SUMMARY

The evidence available at present indicates quite clearly that the prognosis for patients with hypertensive cardiovascular disease ranging from slight to marked is significantly improved by thoracolumbar splanchnicectomy.

The patients who have derived the greatest benefit are those who fall into Groups 2 and 3 (my classification).

The effect of surgical treatment on prognosis affords the only reliable basis so far developed for the selection of cases for splanchnicectomy.

The survival curves for patients after they have had thoracolumbar splanchnicectomy should be useful in judging the relative merits of different forms of therapy in consecutive cases having varying amounts of cardiovascular disease when first seen.

PHYSIOLOGY OF GASTRIC SECRETION AND ITS RELATION TO THE ULCER PROBLEM

Lester R. Dragstedt, M.D., Harry A. Oberhelman Jr., M.D.
and
Edward R. Woodward, M.D., Chicago

An excessive secretion of gastric juice, both in the asting stomach and in response to the ingestion of food, has been found to be present in most, if not all, patients with duodenal and gastrojejunal ulcers, when appropriate methods for its detection have been employed. Observations on patients with peptic ulcer who have been treated by complete gastric vagotomy, supported and amplified by studies on experimental animals, indicate that this hypersecretion is the cause of the ulcers, is the chief factor which prevents them from healing, and that it is predominantly, if not exclusively, of nervous origin.

Hypertonicity and hypermotility of the stomach are likewise usually present in patients with duodenal and gastrojejunal ulcers, and are also of nervous origin. While there is no doubt that this hypertonicity and hypermotility contribute to the epigastric discomfort of these patients, they are probably of minor importance in the cause of ulcer or in determining chronicity.

In describing the mechanism of gastric secretion, physiologists have referred to the nervous or cephalic, the gastric, and the intestinal phases of secretion.[1] These

Read before the Joint Meeting of the Section on Gastro-Enterology and Proctology and the Section on Pathology and Physiology at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 15, 1951.

[1] Babkin, B. P.: Secretory Mechanism of the Digestive Glands, Ed. 2, New York, Harper & Brothers, 1950.

terms refer to the fact that secretion by the gastric glands in the body and fundus of the stomach may be stimulated by impulses in the vagus nerves aroused reflexly by the sight, odor, or taste of food, and also by the presence of food in the stomach or intestines. In a recent experimental analysis of the relative importance of these three phases of secretion, my associates and I [2] have found that in normal dogs the nervous phase of secretion accounts for approximately 45% of the gastric juice secreted in a 24-hour period, the gastric phase about 45%, and the intestinal phase 10% or less. These estimates are not precise, since there appears to be a definite inter-relationship, at least between the nervous and gastric phases of secretion. Thus, removal of the nervous phase of secretion by complete vagotomy likewise materially reduces the gastric phase of secretion, and elimination of the gastric phase of secretion in turn reduces the effectiveness of the nervous phase. The gastric phase of secretion was found to be mediated exclusively by the mucous membrane of the antrum of the stomach, which functions as an endocrine organ for the manufacture of the gastric secretory stimulant, gastrin, when it comes in contact with food or when the antrum is moderately distended. Removal of the antrum in Pavlov pouch dogs [3] or transplantation of the antrum to the abdominal wall so that it does not come in contact with food abolishes the gastric phase of secretion. When both the nervous phase of secretion and the gastric phase are eliminated, as by complete vagotomy and removal of the antrum, secretion of gastric juice by the body and fundus of the stomach is reduced to a negligible amount, indicating that the intestinal phase of secretion is relatively unimportant.

The early gastroenterologists were aware of the fact that the acidity of the gastric content following an Ewald test breakfast in duodenal ulcer patients is usually higher than that in normal persons, and they sometimes erroneously ascribed this to hyperacidity of the gastric juice itself. Many recent studies have confirmed the older view of Pavlov, that gastric juice, both in normal persons and in ulcer patients as well, is secreted at a constant acidity when the electrolyte composition of the blood is normal. Variations in the acidity of the gastric content for the most part depend on variations in the relative amounts of gastric juice and such neutralizing substances as swallowed saliva, food, mucus from the pyloric antrum, and regurgitated alkaline duodenal juices. Hypersecretion, rather than hyperacidity, of the gastric juice is thus the factor that raises the concentration of free hydrochloric acid in the gastric content of ulcer patients.

METHODS FOR STUDYING GASTRIC SECRETION

Quantitative methods for studying the secretion of gastric juice are usually necessary to demonstrate this abnormal gastric secretion, and for this reason should replace determinations of the free acid concentration in fractional samples of the gastric content, which give little or no information concerning the actual amount of hydrochloric acid manufactured by the stomach. It is likely that this deficiency in the usual procedures for gastric analyses is responsible for the low repute of this clinical test and has caused some experienced physicians to abandon it as of little value. If, however, quantitative methods of collection are applied, data obtained from gastric analyses are of definite value in the diagnosis of duodenal ulcers and, more especially, in forecasting the success of medical management and the eventual necessity of surgical treatment. Thus, we have recently seen two patients who secreted 330 and 337 mEq. of HCl in the 12-hour night period, as compared with 18 mEq., the normal average. It is very probable that this large secretion of acid could not be controlled by any type of medical management the patients could long tolerate, and that surgical measures to reduce the secretion would become inevitable.

The most convenient and satisfactory method that we have found for studying the continuous or fasting secretion of gastric juice in patients has been its recovery by continuous aspiration of an intranasal gastric tube. In employing this procedure it is our custom [4] to place the tube under fluoroscopic control in the lower portion of the stomach and to maintain constant suction with the Wangensteen apparatus from 9 o'clock in the evening until 9 the next morning. During this 12-hour period the patient is shielded from the sight and the odor or taste of food, and since all food has been removed from the stomach by a preliminary gastric lavage as well as by the period of fasting, the usual physiological stimuli for gastric secretion are absent. Some gastric secretion, of course, escapes through the pylorus, and many tests are worthless because of incomplete samples due to plugging of the tube with mucus or because of other accidents. The sample of gastric juice obtained is thus always minimum, and when hypermotility of the stomach is present, as occurs during the insulin test, the amount recovered may be so small as compared with the total amount secreted as to render the determination of little value. The volume and free hydrochloric acid of the night secretion are then measured, and if the volume of secretion is expressed in liters, and the free acid concentration in clinical units, the product of the two represents the free acid present in terms of milliequivalents.

This quantitative method for studying the continuous or fasting secretion may also be employed to determine the secretory response of the stomach to such stimuli as histamine and insulin hypoglycemia. These tests are conveniently performed in the morning when the intragastric tube is still in place following collection of the night secretion. One milligram of histamine acid phosphate is given subcutaneously, and the gastric secretion collected by continuous aspiration for a period of 60 minutes. The product of the volume of juice by the free acid concentration represents the acid output in response to a standard dose of histamine A similar technique may be employed to determine the gastric secretory response to insulin hypoglycemia, in which case it has been our custom to employ an intravenous injection of 20 units of regular insulin and a two-hour period of collection with determinations of the blood sugar to ascertain the degree of hypoglycemia produced.

[3] Woodward, E. R.; Bigelow, R. R., and Dragstedt, L. R.: Effect of Resection of Antrum of Stomach on Gastric Secretion in Pavlov Pouch Dogs, Am. J. Physiol. **162**: 99, 1950.

[4] Woodward, E. R.; Harper, P. V., Jr.; Tovee, E. B., and Dragstedt, L. R.: Effect of Vagotomy on Gastric Secretion in Man and Experimental Animals, Arch. Surg. **59**: 1191 (Dec.) 1949.

With the quantitative method of measuring gastric secretion, one of us (L. R. D.) and Owens reported in 1943[5] hat a hypersecretion of gastric juice occurred in the fastng stomach of duodenal ulcer patients, and that this was educed below the levels found in normal persons by complete division of the vagus nerves to the stomach. Many subsequent studies, both in our own laboratories and elsewhere, have confirmed these early observations. Thus 81 normal persons, or surgical patients without gastrointestinal disease, were found to secrete an average of 18 mEq. of HCl in the 12-hour night secretion, whereas when tested by the same method, 135 duodenal ulcer patients secreted 60 mEq., or almost four times as much. Following complete vagotomy in 70 of these patients, the output of hydrochloric acid was reduced o 11 mEq., or considerably less than that put out by he normal person.

THE NERVOUS PHASE OF GASTRIC SECRETION

Welin and Frisk, in 1936,[6] demonstrated that the gastric glands in duodenal ulcer patients respond to hypolycemia produced by a standard dose of insulin by a reater output of hydrochloric acid than occurs in normal ersons. This was confirmed by Ihre in 1939;[7] and recently by Winkelstein,[8] and in our own laboratories. Duodenal ulcer patients also display an exaggerated gastric secretory response to a standard dose of histamine. Thus, two of us (L. R. D. and H. A. O.)[9] found that 18 ormal males secreted an average of 13.2 mEq. of HCl in period of 60 minutes after the subcutaneous injection f 1 mg. of histamine. In contrast to this, a group of 15 males with peptic ulcer put out 27 mEq. of HCl, or lmost twice as much as the normal person, in response to the same dose of histamine. Complete vagotomy abolhes the gastric secretory response to insulin hypolycemia, indicating that this form of stimulation is ntirely central. It is interesting in this connection that complete vagotomy also markedly decreases the gastric ecretory response to a standard dose of histamine. Thus, he group of ulcer patients described above, who secreted n average of 27 mEq. of HCl in response to a standard dose of histamine, put out an average of only 5.5 mEq. of free HCl after division of the vagus nerves to the tomach. This demonstration that complete vagotomy educes the gastric secretory response to a humoral stimuant of gastric secretion suggests that the secretory reponse to the humoral agent or agents released by the ngestion of food is likewise reduced. This conclusion is supported by the frequent finding of almost complete absence of free HCl in the gastric content of vagotomized patients for a prolonged period after the ingestion of food.

Although work on the lower animals has demonstrated that the nervous phase of gastric secretion is mediated exclusively by the vagus nerves and can be abolished completely when the vagus fibers are divided, it is not yet possible to eliminate the nervous phase of secretion in all patients by surgical methods currently employed. This failure to secure a complete or near-complete vagotomy in all patients is the chief defect in this operative procedure. It is almost certainly due to the technical inability of the surgeon to find and divide all of the vagus nerves to the stomach and is very largely overcome as the surgeon acquires increasing experience and the conviction that all fibres must be sought out and divided. Meticulous denervation of the lower 3 in. of the esophagus by a transabdominal, transdiaphragmatic operation has thus far proved to be the most successful method in our experience. The data summarized in Table 1 present our total experience to date on the efficacy of this procedure in producing a complete vagotomy as evidenced by a negative gastric secretory response to insulin hypoglycemia. In 470 duodenal ulcer patients subjected to vagotomy, the insulin test, when performed 10 days after the operation, gave a positive response in 10% of the patients. This represents a minimum figure since some patients fail to respond to insulin hypoglycemia immediately after surgery because of trauma to the vagus nerves, and when tested three to six months later give a positive response. In 81 patients in whom the insulin test was performed one year following the operation, 28% yielded a positive response, indicating preservation of some vagus innervation to the stomach. A similar high percentage of positive insulin tests was obtained in smaller groups of patients examined two, three, four, and five years after the operation. These data are, of course, significant only with respect to the particular group of patients examined and not to the group as a whole. Dissatisfaction with the operation has been largely due to incomplete vagotomy, and since patients who have failed to secure a perfect result are easier to bring back to the hospital for subsequent examination and secretory studies, an element of selection necessarily exists.

TABLE 1.—*Early and Late Effect of Vagotomy on Gastric Secretory Response to Insulin Hypoglycemia in Duodenal Ulcer Patients*

While a positive response to insulin hypoglycemia, in our opinion, indicates the presence of intact vagus secretory fibers to the stomach, such a positive test does not by any means indicate that the nervous phase of secretion has not been eliminated. The best evidence that we have in support of this statement has been obtained on experimental animals. We have several times observed Pavlov pouch dogs who gave a positive response to insulin hypoglycemia, thus indicating the presence of some vagus innervation to the isolated stomach pouch. However, when the vagus nerves were subsequently divided in the chest and the secretory response to insulin hypoglycemia abolished, the total output of gastric juice from the isolated stomach was not reduced. We have taken this to indicate that insulin hypoglycemia is a more potent stimulus to the gastric secretory fibers in the vagus than is the sight, odor, or taste of food, and that when a meagre vagus innervation is present, a secretory response is obtained only to the stronger stimulus. Support for this conclusion is obtained from the data summarized in Table 2. This shows that the amount of hydrochloric acid secreted in the 12-hour nocturnal gastric secretion was reduced from 79 to 98% of the preoperative level, and this reduction was just as marked in the patients examined after two, three, four, five, six, and seven years as it was 10 days after the operation.

ULCER RECURRENCE AND NIGHT GASTRIC SECRETION

Abolition of the excessive night secretion of gastric juice is the most important alteration in the physiology of the stomach produced by vagotomy in duodenal ulcer patients, both from the standpoint of predicting healing of the lesion and the prevention of recurrence. The data summarized in Table 3 show that there is a definite relation between the degree of reduction in the nocturnal gastric secretion after vagotomy and the response to the insulin test. In a series of 307 patients where both preoperative and postoperative night secretion was carefully determined and the insulin test performed, 30 patients secured a reduction in the free acid output of 60% or less. The distribution is indicated in the table. Thirty per cent of these patients displayed a positive insulin test following the operation. The remaining 277 patients secured a reduction in the night secretion ranging between 60% and 100%, or complete anacidity. In this group, 19, or only 7% of the total, showed a positive insulin test.

HYPERSECRETION OF GASTRIC JUICE AS A CAU
DUODENAL ULCER

In an examination of the theory that ulcers a
to the corrosive and digestive properties of the
content, at least two factors call for consider
namely, the resistance of the mucous membrane a
intensity of the chemical irritation by the gastric
tent. The corrosive properties of the gastric conte
the most part are due to the hydrochloric acid and p
of the gastric juice and are markedly increased
hypersecretion is present. Food, mucus, and regurg
duodenal content must be regarded as protecti
buffering material. The observation, repeatedly

med, that gastric secretion, and hence the corrosive operties of the gastric content in patients with gastric er, are within normal limits, indicates that the impornt cause of these lesions must be a local decrease in e resistance of the gastric wall to peptic digestion. is decrease in resistance may in turn be due to thromsis or embolism of the gastric arteries, as called for the theory of Virchow and Hauser. We have encouned three cases in which such thrombosis was found.

Hypersecretion of gastric juice is regularly found in tients with duodenal ulcer. The corrosive properties of gastric content in these patients are greater than norl so that it is necessary to raise the question: can a nple increase in the corrosive properties of the gastric ntent produce an ulcer without local decrease in resistce of the gastric or duodenal wall? Data from the perimental laboratory indicate that the mucous memane of the stomach, duodenum, esophagus, or jejunum ll succumb to the digestant action of pure gastric juice to a gastric content consisting predominantly of gastric ce.[10] Although it is probable that a similar result would cur in man, it is not possible at the present to state at spontaneously occurring duodenal ulcers are due clusively to the increased corrosive properties of the stric content rather than to a combination of this factor d a local decrease in resistance which might at least termine the site and size of the ulcer. Less difficulty ses in analyzing the pathogenesis of gastrojejunal ulcer, ere it is clear that exposure to the gastric content in new location causes the disease. One important fact s come to light as a result of both clinical observation d animal experimentation, namely, that stoma ulcer curs only when a hypersecretion of gastric juice exists. e secretion of gastric juice is within normal limits or pressed in patients with gastric ulcers or with carcima in the region of the pylorus. Gastrojejunal ulcers ely or never occur following gastroenterostomy in se patients. Stoma ulcers rarely or never occur folving gastroduodenostomy or gastrojejunostomy in norl dogs The complication is most commonly seen in n following gastroenterostomy, in patients with duonal ulcer associated with marked hypersecretion. It curs in dogs following gastroenterostomy or gastroodenostomy if a hypersecretion of gastric juice is perimentally produced. This may be done by the imntation of histamine and beeswax into the subcutanes tissues as demonstrated by Wangensteen and his sociates [11] or by causing an experimental hyperfunction the gastric antrum, a recent finding in our laboratory.[12]

In quantitative secretory studies on dogs with isolated eidenhain pouches of the body and fundus of the stomh, it was found that transplantation of the antrum into e abdominal wall so that it could not come in contact ith food markedly decreased or abolished the secretion gastric juice from the isolated pouch. This secretion as subsequently returned to approximately the normal vel when the antrum was reimplanted into the duodeum as a diverticulum. When, however, it was reimlanted into the colon, the secretion of gastric juice from e isolated pouch was increased to approximately twice e normal level, and this increase persisted until the ntrum transplant into the colon was removed. When ustained hypersecretion of gastric juice due to hyperfunction was produced by this method, it was then found that stoma ulcers occurred in 80% of animals following gastrojejunostomy and in 20% of animals following gastroduodenostomy.

In 1927 Silbermann [13] produced a hypersecretion of nervous origin with ulcer formation in dogs by repeated sham feeding experiments in animals provided with a double esophagostomy. In 1935 I [14] reported that ulcers regularly develop in the totally isolated stomach of the dog if the vagus innervation to the stomach is carefully preserved. Since ulcers never occur in such preparations when the vagus nerves have been divided, these ulcers may be considered to be predominantly of nervous origin. With this experimental demonstration, that a hypersecretion of gastric juice with ulcer formation may result from exaggerated activity of either the nervous phase of secretion or the hormonal or antrum phase, it becomes of importance to determine whether the hypersecretion present in patients with duodenal ulcer is of nervous or antrum origin. Data alluded to previously in this paper which indicate that the hypersecretion of gastric juice in duodenal ulcer patients is abolished in up to 98% of instances by vagotomy provide strong support to the conclusion that this hypersecretion is usually of nervous origin. This is supported by the clinical observation made when gastrectomy was first introduced that simple removal of the gastric antrum was not sufficient to prevent a high incidence of subsequent stoma ulcers, and more extensive resections came into vogue. The fact, however, that antrum hyperfunction with hypersecretion can be produced in experimental animals, and that this hypersecretion may cause typical progressive ulcers in a large percentage of cases, makes it necessary to scrutinize patients with this possibility in mind.

The exaggerated gastric secretory response of duodenal ulcer patients to both humoral and nervous stimulation indicates that the gastric glands or the local neuroglandular complexes of these patients are hyperirritable or hypersensitive to normal physiological stimuli. Is this peripheral hypersensitivity the fundamental secretory abnormality that must be corrected, or is the disease of central nervous origin? The observation that vagotomy markedly reduces the gastric secretory response of dogs as well as ulcer patients to a standard dose of histamine suggests that the sensitivity of the gastric glands is normally due to the tonic effect of the vagus and that this sensitivity is excessive in ulcer patients because of a hypertonus in these nerves.

Recognition of the exaggerated gastric secretory response of duodenal ulcer patients to both humoral and nervous stimulation is recent, and has not received extensive study. Presumably, this heightened response indicates that the gastric glands or the local neuroglandular complexes in these patients are hypersensitive or hyperirritable. The observation[9] that vagotomy markedly reduces the gastric secretory responses of total pouch dogs to a standard dose of histamine suggests that the sensitivity of the gastric glands is normally dependent on the tonic effect of secretory fibers in the vagus nerves. This sensitivity may be excessive in ulcer patients because of hypertonus in these nerves or there may be a continued bombardment of the gastric glands by secretory nerve impulses. The increased incidence of duodenal ulcer in persons whose occupations subject them to nervous tension and strain and the exacerbation of ulcer symptoms under such conditions have led to the characterization of this disease as of psychosomatic origin. Proof of this contention is difficult to obtain. It is attractive to speculate that in some way the tensions and emotions of competitive effort arouse a hypertonus in the vagus secretory mechanism, and that it is in this way that the central nervous system plays a role in the disease. The possibilities of artifically induced tension states in aggravating the disease and of psychotherapy in alleviating it ought to be reexplored, using quantitative studies on the fasting gastric secretion as an objective criterion.

SUMMARY

The nervous or cephalic phase of gastric secretion is mediated by the vagus nerves, and is permanently abolished by complete vagotomy. The gastric phase of secretion is mediated by the antrum of the stomach which functions as an endocrine organ for the manufacture of the gastric secretory excitant, gastrin. The gastric phase is eliminated by complete removal of the antrum or by transplanting the antrum to the abdominal wall so that it does not come in contact with food. In normal animals the nervous phase of secretion accounts for about 45% of the gastric acid produced in a 24-hour period, the gastric or antrum phase about 45%, and the intesti phase 10% or less. When the nervous and gastric phas of secretion are eliminated by vagotomy and antrum r section, the secretion of acid by the body and fundus the stomach is reduced to a negligible amount. In expe mental animals a hypersecretion of gastric juice of n ous origin with ulcer formation can be produced in vag innervated total-pouch dogs by draining the gast secretion to the exterior instead of into the intesti tract. A similar hypersecretion with ulcer formation due to hyperfunction of the gastric antrum may be p duced in experimental animals by transplanting antrum into the colon. A hypersecretion of gastric juic regularly found in patients with duodenal and gast jejunal ulcers. This hypersecretion is usually of nerv origin and may be reduced to normal or subnormal lev in 97% of patients by an adequate transabdominal sup diaphragmatic section of the vagus nerves. Removal the gastric phase of secretion in duodenal ulcer patie by resection of the antrum is not regularly followed b marked reduction in secretion and the high incidence stoma ulcer following this procedure is further evide that the hypersecretion is not of antrum or humoral gin. Failure to secure healing of the ulcer or recurre in our experience has been almost always associated w an incomplete vagotomy, as revealed by repeated posit insulin tests six months or later after the operation, persistence of the nocturnal hypersecretion. The perce age of incomplete vagotomies steadily decreases as surgeon gains experience, but is not eliminated present techniques, and this constitutes the chief we ness in this method of surgical therapy.

CLINICAL EVALUATION OF METHANTHELINE (BANTHINE®) BROMIDE IN GASTROENTEROLOGY

G. Gordon McHardy, M.D., Donovan C. Browne, M.D., Frank H. Marek, M.D., Robert McHardy, M.D.
and
Swan Ward, B.S., New Orleans

Clinical evaluation of any new drug is hazardous. This invariably is true when the drug is used to influence the physiology of the gastrointestinal tract, where an early affirmation of efficacy frequently is negated by extensive and competent trial. Time and astute observation by critical clinicians establish the status of a therapeutic agent, confirming or denying those claims—chemical, physi and physiological—which emanate from the laborator In the final analysis, it is the clinician who establishes virtues of a product whose potentialities have been dorsed by the research departments.

Methantheline (banthine®) bromide, introduced a remedy for peptic ulcer,[1] after being received with p mature enthusiasm, encountered rigid conservatism d ing its probationary period. No truly disparaging repo on this new anticholinergic have been recorded. From period of adequate and critical evaluation methantheli bromide emerges as an adjunct to ulcer management a is alleged to influence many gastrointestinal functions.[2] has inspired extensive laboratory and clinical investig tions, stimulating a keener professional insight and ther peutic approach to the physiology of gastrointestin function.

From the Browne-McHardy Clinic.

Aided by a grant from the Medical Group Research Fund.

Methantheline (banthine®) bromide was generously supplied by Irwin C. Winter, M.D., Clinical Research Division, G. D. Searle & Company, Chicago, and bentyl® hydrochloride was generously supplied by Raymond C. Pogge, M.D., Clinical Research Division, William S. Merrell Company, Cincinnati.

Read before the Section on Gastro-Enterology and Proctology at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

N.: The Use of Banthine in the Treatment of Duodenal Ulcer: Preliminary Report, Cleveland Clin. Quart. **17**: 234, 1950.

This anticholinergic, a quaternary ammonium salt beta-diethylaminoethyl xanthene-9-carboxylate-methoromide) has dual effectiveness; it inhibits acetylcholine berated at the postganglionic parasympathetic nerve ndings and it blocks acetylcholine transmission through utonomic ganglia. Hambourger[3] and his associates, emhasizing these manifold activities of methantheline, inicated the potentialities of curariform effect. Winter[4] as postulated interference with afferent sensory imulses.

An extensive bibliography substantiates the potency of ethantheline on physiology of the gastrointestinal tract. rom our observations a practical clinical evaluation of ethantheline in relation to secretion, motility, healing, nd pain relief has been made. As far as was possible, all f our studies were controlled with atropine, bentyl® hyrochloride (beta-diethylaminoethyl 1-cyclohexylcycloxanecarboxylate hydrochloride), and placebos. Alough we appreciate the objective influence of placebos at was demonstrated by Wolf, we nevertheless feel stified in their inclusion in such studies.

SECRETION

Although knowledge of methantheline's influence on cretory function is incomplete, certain observations e conclusive, confirmed, and acceptable. Salivation is iformly inhibited. The inhibition was definite in 86% 200 patients studied, and was directly related to sensivity of the patient and dosage of the drug. This effect transient. Tolerance to the drug often is acquired with- 72 hours. Ten normal fasting men had an average rced expectorable oral salivation of 32 cc. in an hour. hirty minutes after administration of 100 mg. of meththeline (parenteral) they were able to produce only cc. of saliva in an hour. After these patients were on ethantheline therapy for 72 hours, salivation averaged 6 cc. in an hour. Although this effect is of interest, it is gnificant in proof of action and amelioration. Halouek[5] has stressed its aid to the oral surgeon. After seven ays of therapy with the drug, there was no demonstrable hibition of saliva. In 10 cases of infectious parotitis ere was comparable salivary depression without influnce on the course of the disease. In all cases the salivary ecretions remained acid. Bentyl® (50 mg.) showed an ppreciable salivary inhibition in only 22% of patients.

Esophageal intubation in five instances of neoplastic sophageal obstruction and in five of obstructive cardiopasm revealed an insignificant diminution in both series rom a 24-hour average suction of 326 cc. of saliva luring the control period when no drug was given to 75 cc. when methantheline was given in 100 mg. mounts parenterally every four hours. In this study bstinence from swallowing saliva was exacted. The secretions were alkaline throughout. This limited observaion apparently confirmed an anticipated absence of nethantheline's influence on esophageal secretion. Atropine and bentyl® likewise exerted no obvious esophageal influence.

Gastric secretory studies though voluminous are inconclusive. Hormone, uropepsin, and lysozyme influence have not been established. To a variable degree the ganglionic blocking action of methantheline controls the volume of gastric secretion apparently more uniformly than it controls acid production. The claims of inhibition of gastric secretion in volume, titratable acidity, and nocturnal secretion, together with modifications of the secretory response to insulin hypoglycemia, have been modified. If vagal inhibition is achieved by methantheline, apparently either a secretory response may result from a vagal action other than cholinergic, or a dose adequate to cause full inhibition cannot be given. The latter seems unlikely in the presence of evidence of profound atropine-like effect in our studies.

Ten selected normal male students were used for controls because of their normal gastric secretory responses. Twelve-hour secretory studies with parenteral methantheline (100 mg. every four hours) showed a uniform and definite depression as to volume but slight effect on titratable free acid as illustrated.

A comparable study was done in 10 men, each with active acute duodenal ulcer (symptomatology of less than 12 months' duration). The secretory depressive effect was significant.

In 10 patients, each with active duodenal ulcer accompanied by marked nocturnal pain but no radiologic evidence of obstruction, there was inconstant but definite methantheline secretory depression. In explanation of inconsistency it is suggested that some persistent hypersecretors were more disturbed, remained awake, and obviously were highly emotional.

In a study of 10 cases we were unable by the use of arenteral methantheline to modify appreciably the secretory response to insulin hypoglycemia and to histamine stimulation in any way other than that of an insignificant diminution in volume.

In 10 selected chronic duodenal ulcer patients of the typical "intractable variety" the methantheline response

was surprisingly dramatic when compared with the acute duodenal ulcer series.

Comparable gastric ulcer patients were not available for such a complete survey. However, in 10 hyperchlorhydric benign gastric ulcer patients, studies were conducted for secretory inhibition with the charted favorable response.

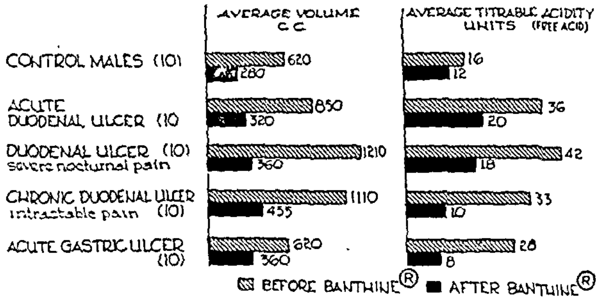

Chart 1.—Influence of methantheline (banthine®) bromide on gastric secretion during continuous suction for 12-hour periods during the night. Methantheline was given parenterally every four hours *in doses of 100 mg.*; during the control period placebo hypodermics were given every four hours.

In these gastric secretory studies, when 1/75 grain (about 0.8 mg.) of atropine and 50 mg. of bentyl® hydrochloride were used as equivalent to 100 mg. of *methantheline*, they were of approximate efficiency in volume secretory depression and without any influence on titratable acidity.

In 4 patients with duodenal and 3 with jejunal fistulas *and* 10 with a permanent ileostomy, a 24-hour quantitative study of excretion was made with the patient restricted to a 24-hour oral fluid intake of 2,500 cc.; methantheline, 100 mg. parenterally administered every four hours, did not appreciably alter fistula *output*. In the ileostomy patients there was an appreciable and constant influence in an average of 33%. Atropine in doses up to 1/75 grain showed no influence whatever. Bentyl® in 50 mg. doses, like methantheline, was limited in its influence on ileostomy output, but it was of equivalent efficiency.

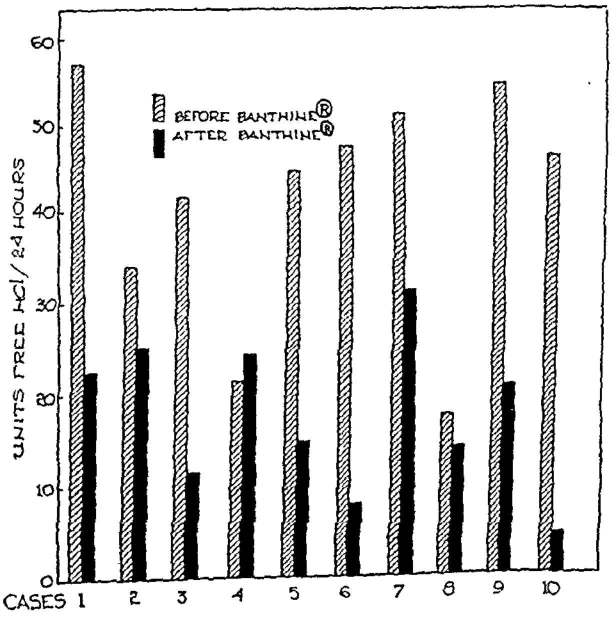

Chart 2.—Variable responses in nocturnal pain in duodenal ulcer patients.

Two patients in whom pancreatic fistulas developed as a complication to a modified Whipple pancreatic resection, *two in whom* the same condition developed as complication to a gastric resection, and one patient i whom this condition resulted from inadvertent surge for acute pancreatitis were studied from a volumetr view. There was dramatic inhibition of fistulous draina to an average of 60% during a 72-hour period of thera with 100 mg. of methantheline parenterally administer every four hours. All patients recovered. In a single ad *tional* case *there* was *no* apparent benefit from metha theline. Neither atropine nor bentyl® could be credit with so definite an influence.

Four patients with choledochostomy drainage sub quent to *cholecystectomy* for choledocholithiasis show an average increase in bile excretion to 240 cc. in hours when 100 mg. of *methantheline* was administe every 4 hours. There was no similar effect from atrop or bentyl.® Choleretics were *40%* more efficient. At pine and bentyl® were ineffective. No *adequate* expla tion for this action is available; however, influence duodenal motility might be contributory.

There was an appreciable influence on colostomy put at different colon levels by methantheline, atrop or bentyl.®

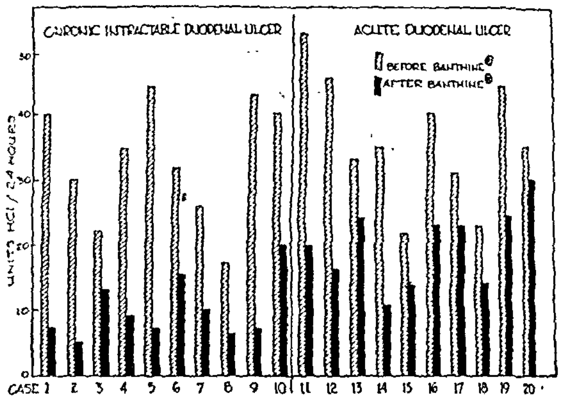

Chart 3.—Responses in chronic intractable ulcer (Cases 1-10) and duodenal ulcer (Cases 11-20).

MOTILITY

Since contraction of the gastrointestinal tract is trolled by cholinergic nerves, methantheline *would* to be an established specific for any dysfunction rel to *hypertonicity*. This theory is tangible but suscept motor responses to peripheral anticholinergics an those acting on the ganglia vary.

As anticipated, the hypertonicity of esophageal sp *was accentuated*. In 18% of 200 esophagograms methantheline-managed duodenal ulcer patients a ra logically demonstrable degree of cardiospasm was countered, in contrast with 3% in *routine diagn* surveys on these duodenal ulcer patients prior to met *theline therapy*. This may partially explain the incr in pyrosis frequently encountered with the initiatio methantheline therapy. Patients with *well-establi* cardiospasm become worse after administration of m antheline. Ten patients with cardiospasm who had passed a mercury-pneumatic dilator were refractor the same bouginage after parenteral administratio 100 mg. of methantheline.

We did not employ gastrometric evaluation. *Ball* kymographic studies [6] have indicated effective *inhibi* of gastric contraction waves by *methantheline*. The ra *graphic* evaluation has indicated that *methantheline* luces sluggish ineffective propulsive contractions with lelayed barium emptying into the duodenum. Gastrocopic observations have confirmed the radiographic indings of cessation of peristalsis and atony of the gastric /all. Persistent emesis considered psychogenic was stoped for an average of three hours in 15 out of 23 trials. Jolden [20] has indicated methantheline's efficiency in hyperemesis gravidarum.

---

[6] Longino et al.[2d] Chapman et al.[2e]

Our radiologic observations were a "blind study" in hat the examiner was not aware that certain patients had een given 100 mg. of methantheline intramuscularly 0 minutes prior to study. In a study of 10 normal paents used as controls, methantheline definitely retarded ie emptying of the stomach in each instance. In seven atients sluggish, ineffective peristaltic waves and hypoonicity were noted. There was no specific comment on ie remaining three examinations. Of 10 patients with ncomplicated acute duodenal ulcer, 8 showed hypotonity, absence of previously described pylorospasm, and ieffective peristaltic activity. In all 10 patients the ulcer rater was more easily demonstrated than at the earlier xamination. A comparative evaluation with atropine nd bentyl® in 60 known ulcer patients showed that methntheline was definitely effective in 75% of cases for the emonstrable inhibition of gastric tonicity as compared ith an effectiveness of 30% with atropine (1/75 grain) nd 60% with bentyl® hydrochloride (50 mg.). There 'as no alteration in the ruga pattern in any instance of ve severe hypertrophic gastritis patients with methaneline, bentyl,® or atropine.

When methantheline was given pregastroscopically in 0 patients, we uniformly encountered (as noted by sher)[7] an atonic stomach easily distended without disomfort to the patients. Peristalsis, when present, was in 'eak waves, and the pylorus did not evert itself into the omach, as it usually does, but appeared patent and ubular. The ruga pattern in hypertrophic gastritis was ot influenced by methantheline. The gastroscopist was ot aware that methantheline had been substituted for the tropine he routinely administered preoperatively, which ad never been recorded as producing a similar effect. 'he definite evidence of influence on color or turgescence f the mucosa as photographed by Abbott and Wolf [8] 'as not present in our study.

Small bowel studies were difficult to interpret. Balloon nanometric [2f, g] studies have indicated the efficiency of nethantheline and the conclusion was drawn that the nticholinergic result is primarily a ganglionic effect of fficient prolonged action on the motility of the small ntestine. In 7 patients with quiescent regional enteritis in whom hyperperistaltic diarrhea was the only active complaint and 10 patients with active regional enteritis, methantheline in 100 mg. doses parenterally administered every two hours did not alter the six-hour hypermotility of barium nor of gentian violet when the patient was free of barium. The radiologist did not offer any descriptive alteration over previous studies. In 10 normal control patients there was no alteration in mucosal pattern other than a suggestion of widening in 3, but there was a definite hypomotility of barium and gentian violet with a prolongation of transit time by an average of 3 hours and 22 minutes. In 17 cases of regional enteritis we have not encountered any beneficial effect from methantheline. In 10 cases of assumed hyperperistaltic diarrhea, in which the barium transit time to the ileocecal valve was less than 90 minutes, an appreciable hypomotility was achieved with methantheline, prolonging the transit time to an average of 256 minutes and ameliorating the diarrhea from an average of 12 stools to 4 stools per 24 hours.

Inaccuracy is obvious in the estimation of colonic function. Data from animal experimentation is rarely applicable to the human subject. The colostomized patient is hardly a candidate for valid experimentation. Kern [21] and his associates give impressive conclusions from balloon kymography in sigmoid studies on the intact human subject. In comparative evaluation, they indicate methantheline's antispasmodic efficiency in drug and food induced sigmoid hyperactivity. It was hypothesized that methantheline-resistant, emotionally precipitated spasm was related to stimulation by extrinsic cholinergic nerves ending within the substance of the effector cell and thereby escaping methantheline's anticholinergic influence, which is an inhibition of acetylcholine entering the cell.

In 20 selected patients in whom bowel habit regulation was a fixed pattern of postcoffee morning defecation we abolished this gastrocolic reflex to defecation in every instance with administration of 100 mg. of methantheline orally 30 minutes prior to coffee ingestion. This consistent effect seems to confirm the abolition by methantheline of gastrocolic reflex observed by Kern [21] and his associates.

Actual colon disease entities in our observation were not influenced by methantheline. Diarrhea concomitant to neoplasm in 18 patients (cecum, three; ascending colon, one; transverse colon, one; descending colon, three; sigmoid, four; rectosigmoid, six) was not altered. The hypermotility diarrhea of the various forms of chronic ulcerative colitis was not influenced in 60 cases studied (amebiasis, 36; idiopathic chronic ulcerative colitis, 18; tuberculous cecitis, 2; lymphopathia venereum, 4.)

In the severe irritable colon syndrome (20 patients) in which both hypersecretion and hypermotility contributed to cause a persistent diarrhea with copious mucus and fluid stools in excess of eight daily, methantheline in doses of 400 mg. daily had a limited but appreciably favorable effect. Frequency of defecation and diminished mucus occurred in 11 patients. In the subjective evaluation 16 patients claimed amelioration of pain and tenesmus coupled with ability to control defecation. In this respect the gastrocolic reflex was aborted in 13 cases. This influence of methantheline, however, was not perpetuated on withdrawal of the anticholinergic, nor was it persistent, since there were recurrences in every patient maintained on methantheline within a follow-up of six months, and those recurrences proved refractory to an increase of methantheline to full tolerance.

In the so-called spastic form of constipation there was no evidence of methantheline's influence in 20 patients adequately observed.

In 10 patients specifically complaining of painful urgency to defecate, with proctosigmoidoscopic exami-

8. Abbott, F., and Wolf, S.: Effects of Banthine on Gastric Function of Normal Men and Subjects with Peptic Ulcer, unpublished data.

nations showing only extreme spasm and radiological studies entirely negative, preproctosigmoidoscopic parenterally administered methantheline (100 mg.) ameliorated the endoscopic evaluation of spasm in only three of the 10 patients. Methantheline did not ameliorate the dyschezic discomfort in these patients when continued in full therapeutic dosage. In the spasm endoscopically observed in association with actual rectosigmoid disease there was no appreciable influence accreditable to methantheline. No specific influence on rectosigmoid mucosal color or turgescence was observed.

Twenty patients with acute febrile diarrhea of undetermined cause with an average of four stools an hour had complete cessation of defecation for four hours after 100 mg. of parenteral methantheline. No other medication was given and methantheline was not continued. Diarrhea recurred in 17 and was again controlled by methantheline.

Anal sphincteric spasm without associated demonstrable pathology in 20 patients was not demonstrably ered by methantheline despite the fact that an occanal patient on large doses of the drug complained of mild fecal incontinence.

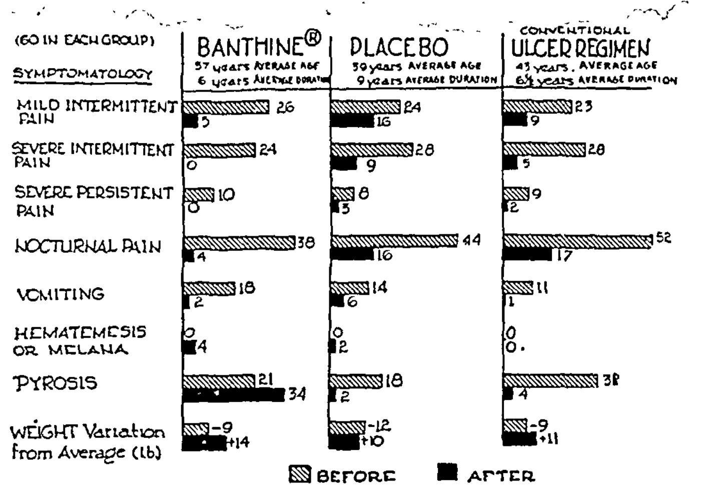

Chart 4.—Comparative therapeutic evaluation of symptomatology in male patients with uncomplicated duodenal ulcers after an 18-month follow-up.

HEALING

Our study was in this respect limited to a single specific entity: uncomplicated duodenal ulcer with an 18 month follow-up. Patients submitted to surgery in the course of the study were excluded from the series. All patients initially had definite ulcer craters on radiologic examination.

Sixty duodenal ulcer patients have been managed as ambulatory patients with the usual adjunctive dietotherapy and symptomatic measures in addition to methantheline. The control series were managed by an acceptable ambulatory ulcer regimen supplemented by a placebo resembling methantheline, and a third group comprised patients not given any antispasmodic other than inadequate doses of atropine. Methantheline was used orally in this study, given in 100 mg. doses every six hours until the patient was asymptomatic and thereaft adjusted to 50 mg. before meals and 150 mg. at bedti

The curative effect of methantheline so enthusiastica initially sponsored for duodenal ulcer by Grimson a others is questioned. Similar variation may be encou tered in any group of ulcer patients; perfect cont

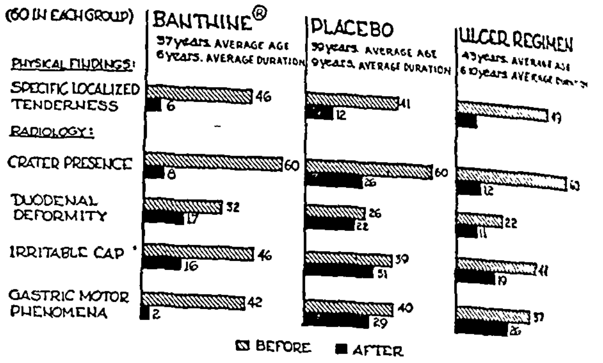

Chart 5.—Comparative therapeutic evaluation of physical and r logical findings in male patients with uncomplicated duodenal ulcers an 18-month follow-up.

studies are not possible. The percentage of "cures' both groups does not appreciably vary from that of previous evaluation of ulcer patient management. R tivation (symptomatic) during therapy was not unus

It is difficult to rationalize Lium's[9] concept, vagotomy might influence the course of ulcerative co which motivated the surgical efforts of Thorek,[10] D nis,[11] and others. We could demonstrate no influence healing accreditable to methantheline in 18 patients severe chronic "idiopathic" ulcerative colitis, nor in patients with regional enteritis.

The premise that pancreatitis may be favorably fluenced by methantheline is suggested in our secre studies and in the pain relief recorded, but we do not that a claim of "healing" due to therapy with this is justifiable.

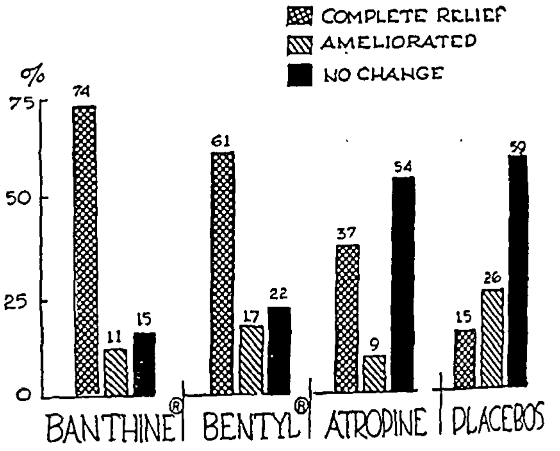

Chart 6.—Pain in pylorospasm without *demonstrable concomitant* ease in 46 patients.

PAIN RELIEF

Pain depends primarily on the interpretation of comfort by the individual patient. Pain relief may fur evoke an emotional reaction, especially when a pa teral medication is used. In an effort to evaluate thi accurately as possible, considering all of the pitfalls such an attempt, we used comparable preparatio atropine, bentyl,® and placebos.

10. Thorek, P.: Vagotomy for Idiopathic Ulcerative Colitis and Regional Enteritis: Results in 21 Cases, J. A. M. A. 145: 140 (Jan. 20) 1951.

11. Dennis, C.; Eddy, F. D.; Frykman, H. M.; McCarthy, A. M., and Westover, D.: The Response to Vagotomy in Idiopathic Ulcerative Colitis and Regional Enteritis, Ann. Surg. 128: 479, 1948.

Pain, a prominent part of these entities, was consid- ed.

In cardiospasm (18 patients) no relief was provided y methantheline nor by any of the control preparations.

In pylorospasm without demonstrable concomitant isease (46 patients) the results are shown in Chart 6.

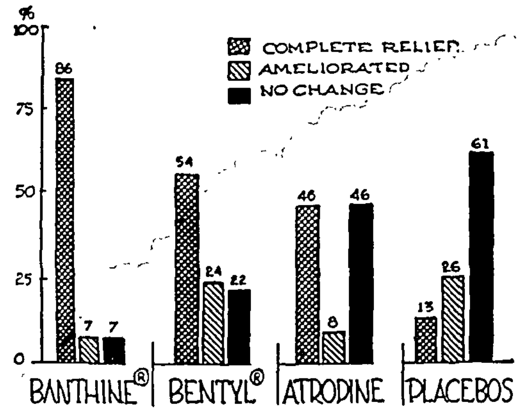
In uncomplicated duodenal ulcer with typical pain 200 cases) the results are shown in Chart 7.

In duodenal ulcer with nocturnal ulcer pain (20 cases) e results are shown in Chart 8.

In addition we attempted an evaluation of methantheline pain relief in a group of 159 patients with oral and renteral preparations; the results are shown in Chart 9.

In six cases of painful pancreatic calculosis in which e symptomatology was fairly specific of chronic recurnt pancreatitis, pain relief was achieved in five with ethantheline therapy but was not influenced by bentyl,® ropine, or placebo.

In seven cases of severely painful acute pancreatitis in ich methantheline was used the pain was aborted withit need for narcotics in four instances, definitely eliorated in two, and the drug was of no apparent luence in one. Atropine used in controls had no influce in any case.



rt 7.—Typical pain in uncomplicated duodenal ulcer in 200 patients.

In six patients with biliary colic methantheline did t influence the character or severity of the pain.

No other observations were considered sufficiently ecific for evaluation.

COMMENT

While certain reservations obviously must be exacted accepting conclusions from these studies, one cannot scount the practical aspects of clinical observation and e reasoning that justifies the following statements.

We have confirmed the relative safety of methanthe- ie. True intolerance was rare. Certain unpleasant side fects have been amply emphasized in earlier publicaons. Curariform reaction was observed once in 562 paents; facial erythemoid dermatitis occurred in two atients. These reactions are probably best termed unsual idiosyncrasies. From our observations coronary eart disease, the preoperative period, and adynamic eus are probable contraindications to methantheline. 'e have precipitated ischemic pain in patients with cornary insufficiency. Postoperative urinary retention was a onstant occurrence when methantheline was used in the eoperative period. Adynamic ileus has been precipiated and accentuated after methantheline therapy.

It is necessary to consider the individual case in order to judge dosage. Dose schedule is arbitrary. Like Winkelstein [2b] we have shifted to antecibum administration in many instances. Anticipating nocturnal difficulties, we adhere to a large bedtime dose (150 to 200 mg.). After symptomatic and radiographic response in ulcer patients we are advocating 150 mg. at bedtime and 50 mg. every morning. As yet we have not found it necessary to discontinue the drug.

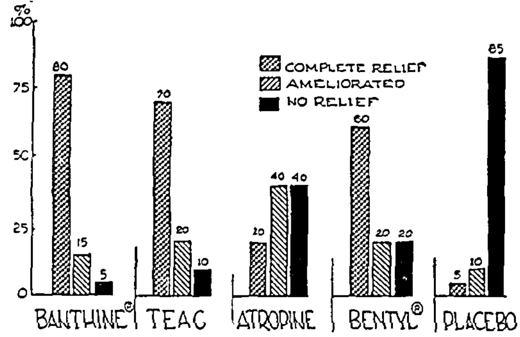


Chart 8.—Nocturnal pain in 20 patients with duodenal ulcers. TEAC is tetraethylammonium chloride.

Gastric secretory inhibition by methantheline does not make us enthusiastic. We feel that volumetric studies are very inaccurate except in complete obstruction, and therefore we are not too impressed by what seems to be a methantheline influence in this respect. However, this inhibition has been a consistent finding in other reports. We concur with others that inhibition of hydrochloric acid secretion by orally administered methantheline is neither consistent nor dramatic. Further, we would like to interject the suggestion that a tolerance to methantheline may be acquired. In four patients who initially showed a satisfactory gastric secretory inhibition in response to methantheline therapy there was a progressive decline at three-month intervals to an eventual absence of response after they had been on methantheline therapy for 12 months.

From our study of small bowel fistulas the data is too inadequate for conclusion but there is the suggestion that ileostomy patients may be assisted by methantheline.

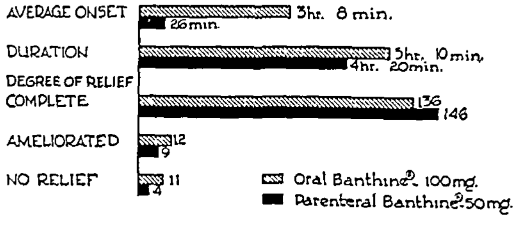

Chart. 9.—Severe typical ulcer pain in 159 patients. Where no relief was experienced, a period of six hours was used in granting duration of effect.

We are encouraged to feel that the pancreatic fistula patients were benefited. The secretory output was definitely influenced. We are cognizant that various healing factors may have contributed to the response. In support of our favorable result have been the prompt response to methantheline in six cases of acute pancreatitis.

While the adjunctive virtues of methantheline in ulcer management are obvious, we stress our earlier cc sion that the basic principles of ulcer management must not be discarded in unwarranted enthusiasm over the dramatic influence of this drug in achieving pain relief.

CONCLUSIONS

1. It is confirmed that methantheline (banthine®) bromide is an effective anticholinergic, a valuable adjunct to the management of many gastrointestinal disturbances characterized by hypersecretion and hypermotility.

2. Methantheline, clinically, is superior to atropine a an antispasmodic. A comparative evaluation with bentyl hydrochloride (beta-diethylaminoethyl 1-cyclohexyl clohexanecarboxylate hydrochloride) and tetraethylam monium chloride is not ventured from our present obs vations, since these two products were not used controls throughout the study.

TREATMENT OF SHOCK IN RECENT MYOCARDIAL INFARCTION BY INTRA-ARTERIAL TRANSFUSION

Earl N. Silber, M.D., Burton D. Levin, M.D., Gerald H. Becker, M.D.
and
Robert C. Levy, M.D., Chicago

A significant reduction in the early mortality following coronary thrombosis with myocardial infarction has resulted from the routine use of anticoagulants, primarily by decreasing the incidence of thromboembolic complications.[1] In many respects, however, the treatment of recent myocardial infarction remains inadequate. This is especially true of patients in whom myocardial infarction is initially or subsequently attended by a clinical picture of profound shock. The appalling mortality statistics are a grim testimonial to the helplessness of the clinician in the effective treatment of this type of case.

Rosenbaum and Levine [2] observed a mortality of 26% when shock was mild, 51% when it was moderate, and 93% when it was severe. Rathe,[3] in a study of 274 cases of recent myocardial infarction, found a mortality of 91.6% in patients with a pulse pressure of 20 mm. Hg or less. Shock was present in 69% of his early fatal cases. The studies of Master [4] disclosed an over-all mortality of 58% when the pulse pressure was 20 mm. Hg or less; in patients previously normotensive, however, mortality was 73%. When the systolic pressure fell bel 80 mm. Hg the patient usually died. Mintz and Ka in a study of 524 cases from Michael Reese Hospi found a mortality of 77.8% when the blood press reached shock levels. Similar observations have b published by Coombs, Fishberg, and others.[6]

Recently one of us (E. N. S.) had occasion to obse a moribund patient (Case 1) in whom severe shock developed with the onset of an anteroseptal infarct. was unconscious, pulseless, without obtainable bl pressure, with three to four irregular gasping respirati per minute, and only electrocardiographic evidence cardiac activity. In desperation an intra-arterial tra fusion of plasma was administered. The immediate be ficial response to this procedure was so striking (accompanying table), although transient, that furt investigation of the value of this form of therapy cardiogenic shock accompanying recent myocardial farction seemed imperative. The following report of results obtained in nine cases represents our prelimin experience with this technique.

SELECTION OF PATIENTS

The nine cases in this study were selected from private medical service of the Michael Reese Hospi The criteria for selection were (1) a history compati with a diagnosis of recent myocardial infarction; (unequivocal electrocardiographic evidence of rec myocardial infarction; (3) the presence of the clin picture of severe shock, as characterized by cold, clam extremities with pallor and/or cyanosis, marked hy tension, small pulse pressure, and faint heart tones quently accompanied by gallop rhythm.

PROCEDURE

The intra-arterial transfusion was carried out in the follow manner. The radial artery was delivered through a 3 to 5 longitudinal incision above the styloid process and cannulated that the infusion was directed toward the heart. This vessel selected because it is easily accessible, unaccompanied by ot important structures in this area, and, in most instances, may ligated with impunity when necessary. The apparatus origina employed for this procedure was similar to that reported Jones and co-workers.[7] However, this equipment proved to too cumbersome, and in subsequent transfusions we utilized

odification of the apparatus designed by Kay,[8] which, besides ing simple, also enabled us to employ arterialized blood under readily controlled infusion pressure (see illustration).

Whole blood was used in seven of the nine cases because of its ygen-carrying capacity and also because the danger of ischemic crosis and subsequent slough associated with the use of other ents was eliminated.[9]

It was our original intent to limit the total amount of blood ad- inistered to 250 to 300 cc., the theoretical capacity of the terial tree.[10] However, in practice it was usually necessary employ considerably more blood in order to obtain the desired nical response (see table). In two cases plasma was employed cause whole blood was not immediately available.

In every instance, despite a depressed sensorium, the procedure ovoked severe pain along the course of the vessels of the arm. is was particularly true immediately after the transfusion was rted. Spasm of the collapsed vessel in response to sudden dis- tion by the blood infused under pressure is apparently the chanism for the pathogenesis of this pain. Liberal infiltration 1% procaine solution at the infusion site was ineffective, and use of morphine was often necessary.

RESULTS

In six of the nine cases the blood pressure was 0 mediately prior to transfusion. In the remaining cases systolic pressure was 95 mm. Hg or less.[11] In no se was the pulse pressure greater than 30 mm. Hg. A nificant initial restoration of blood pressure in eight ses (see table) was induced by 125 to 400 cc. of blood ministered in 10 to 20 minutes. In one case (Case 6) re was no blood pressure response and the patient d during the procedure. This patient was moribund en the transfusion was begun. In the seven cases in ich whole blood was used, the total amount infused ried from 250 to 500 cc., administered over a period 20 to 30 minutes.

One hour after completion of the transfusion, the erial pressure was higher than the initial pressure ponse in four cases (Cases 3, 4, 7, and 9). In one e (Case 2) there was a slight fall in systolic pressure the end of one hour. Subsequently the pressure rose in and was maintained. In two cases (Cases 5 and 8) pressure fell at the end of one hour from the initial el attained with transfusion. In one case (Case 1) systolic pressure remained at the level of initial ponse.

In Case 1 the procedure was performed as a trial. In eight remaining cases, two patients (Cases 3 and 4) de a complete recovery and were discharged from the spital with no clinical evidence of congestive heart lure or coronary insufficiency. Both of these patients re in a state of profound shock without obtainable od pressure at the time transfusion was performed. a third patient (Case 2) in severe collapse intra- terial transfusion produced a dramatic change in the mediate course of the clinical picture. Consciousness ruptly returned, a normal blood pressure and pulse te were restored within 10 minutes, and during the next ur days this improvement was maintained. On the fifth y following transfusion a paroxysmal tachycardia eveloped that did not respond to quinidine sulfate or igitalis, and the patient died 128 hours after intra- terial transfusion. The pronounced favorable altera- on of the clinical course complicated by the develop- ent of an uncontrollable tachycardia that resulted in eath warrants inclusion of this case as an instance of mmediate successful response to this form of therapy.

Case 9 is a fourth instance of an immediate favorable response to this procedure. Admitted in severe shock, this patient had a normal blood pressure and pulse rate and was conscious within one hour after transfusion. Ninety-six hours later the patient was apparently making a satisfactory convalescence, when he gasped suddenly and abruptly died. The mode of death and the absence of necropsy findings other than recent myocardial infarction suggested a ventricular arrhythmia as the immediate cause of death. In Cases 5 and 8 there was no sustained benefit from the procedure. In the former case a harsh systolic murmur developed during the transfusion that suggested the possibility of a rupture of the interventricular septum or a papillary muscle. Unfortunately, permission for a necropsy was not obtained. In Case 7, although the patient was somewhat improved following infusion, the blood pressure rose from 0 to 84/65 mm. Hg during exposure of the radial artery. This made evaluation of the therapy difficult, and for this reason the case is included among the failures. The patient in Case 6 died during the procedure. Although the possibility that transfusion contributed to the death of the patient cannot be excluded, post mortem revealed only a recent myocardial infarct, without other damage to the heart or great vessels.

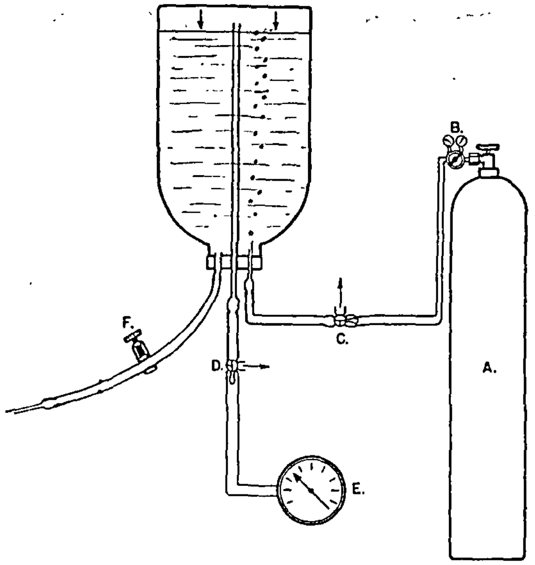

Diagram of apparatus used for intra-arterial transfusion. A is the oxygen pressure tank, and B is the pressure regulator valve. C and D are three-way valves, E is a pressure gage, and F is a screw clamp to regulate the flow of blood into the artery. The blood is "arterialized" by allowing oxygen to bubble into the bottle and escape to the outside through valve D. F is closed during this arterialization. When transfusion is started, F is opened. The manometer is turned into the circuit by turning valve D and records the pressure at which the oxygen entering from A forces blood into the artery.

[11] The level of arterial pressure at which the clinical picture of shock develops is a matter of considerable individual variation. In general, the absolute level is appreciably higher in hypertensive than in normotensive persons (Sampson, J. J., and Singer, I. M.: Plasma an Infusion Following Myocardial Infarction, Am. Heart J. **38**: 54,

COMMENT

It is generally accepted that development of shock in myocardial infarction is initiated primarily by an abrupt fall in cardiac output. This has been experimentally demonstrated by Mendlowitz [12] at this institution. Similar clinical data were obtained by Grishman and Master [13] with the Wezler-Boeger method and by Starr and Wood [14] by means of ballistocardiography. The peripheral vasoconstrictive phenomena, diminished circulating blood volume, and slowing of the circulation time, which subsequently develop, differ in no way from other forms of oligemic shock.

The development of severe shock carries with it certain grave consequences in myocardial infarction. In the first place, since coronary flow depends primarily upon the mean aortic pressure and the cardiac output,[15] a sharp decline in these two factors not only may favor the development of more extensive infarction, but may exert a deleterious effect on the contractile power of the viable muscle. Studies of the shock state based upon changes in ventricular volume, arterial and ventricular pressures, and electrocardiograms point to the deterioration of the myocardium under such circumstances.[16] This depre
of the heart may become irreversible and make reco
impossible.[10] The experiments of Prinzmetal [17] su
that a myocardium weakened and herniating owi
insufficient blood may show a prompt return toward
mal with the addition of plasma or blood. Secondl
cerebral ischemia accompanying a decline in cardia
put may of itself operate to intensify the shock sta
depression of vital centers. The finding of Opdyke [1
circulatory failure could be induced in dogs by me
cerebral ischemia alone suggests that such a mech
may operate clinically, although there is at prese
evidence to support this concept.

Finally, the marked diminution in renal blood f
leads to ischemia and damage of renal tubules.[20] If
is prolonged lower nephron nephrosis may develop
after a normal blood pressure has been restored
Cases 3 and 4 of our group, in which the shock stat
present for only two and one-half and three hou
spectively, moderate to severe oliguria and azo
developed but ultimately disappeared.

There is good evidence to indicate that blood
duced into the radial artery reaches the arch of the
the coronary arteries, and the cerebral circulation.
and his colleagues [7] demonstrated by a series of a
grams in dogs that when iodopyracet concentrated
tion (diodrast®) was infused into the femoral art
levels of systemic pressure less than 50 mm. H
arteries arising from the aortic arch were visualize
cluding the coronary and cerebral circulations. P
described an immediate inspiratory gasp in dogs e
guinated to the point of respiratory arrest when an i
arterial transfusion was administered. Respira
subsequently were restored. Page attributed this
nomenon to the perfusion of the respiratory center. J
and his associates [7] confirmed this interpretatio
demonstrating that this response could be abolishe
clamping the vertebral arteries and could be mac
reappear by releasing the clamps during the course

intra-arterial transfusion. In our Cases 1 and 2, this initial inspiratory gasp was observed with the inception of the transfusion, indicating clinical reproduction of the xperimental results obtained by Page.

The advantages in the treatment of shock resulting rom myocardial infarction by intra-arterial transfusion nay be summarized as follows. 1. Only a relatively small mount of blood is required to restore rapidly blood pressure and a normal circulating blood volume. A much arger amount is required intravenously to produce an quivalent effect and must be given slowly by this route o avoid further burdening of the heart. Therefore, it is ot often possible to effect a prompt restoration of normal emodynamics by the venous route.[23] In the presence of ulmonary edema intravenous fluids are contraindicated; owever, we have found that intra-arterial infusion ppears to have no deleterious effect, even in the presence of pulmonary engorgement. In our experience the nprovement in the heart condition accompanying the estoration of an effective coronary circulation is often ollowed by clinical evidence of a diminution in pulionary congestion. When shock following recent infarcon is accompanied by evidence of systemic venous ngorgement, the procedure of choice is the removal of 00 to 400 cc. of blood from the venous side followed y its "arterialization" and rapid introduction into the rterial system. It has been our observation that when itra-arterial transfusion produced no rise in systemic ressure or a transient rise which persisted only during e period of infusion, these were ominous signs, indicave of irreversible peripheral vasodilatation or irreparble myocardial depression.

2. Intra-arterial transfusion, by its improvement of oronary flow, tends to relieve hypoxia and to restore the normal contractile power to that portion of the myocardium that has not been infarcted. For this purpose, arterialized whole blood is the agent of choice. Since the severity of the shock is not necessarily correlated with the extent of myocardial damage, a striking effect may be obtained, despite the clinical picture, provided intra-arterial transfusion is performed early enough before irreversible cardiac depression has been sustained. The importance of prompt initiation of therapy is illustrated by our experience, in which the most gratifying responses occurred in the three cases (Cases 3, 4, and 9) with the shortest intervals between the onset of shock and transfusion. 3. Intra-arterial transfusion results in prompt stimulation of the respiratory centers; as indicated by prompt improvement of respiration and restoration of a normal sensorium. 4. Finally, intra-arterial transfusion provides for the rapid return of kidney function by reestablishing an adequate filtration pressure.

The results reported here, it should be stressed, are of a preliminary nature. Whether this technique will come to occupy an important place in the treatment of shock induced by myocardial infarction is yet to be determined. Our present experience has been sufficiently promising to warrant further investigation of this therapy.[24]

HYDROCORTISONE AND CORTISONE INJECTED INTO ARTHRITIC JOINTS

COMPARATIVE EFFECTS OF AND USE OF HYDROCORTISONE AS A LOCAL ANTIARTHRITIC AGENT

Joseph L. Hollander, M.D., Ernest M. Brown, Jr., M.D., Ralph A. Jessar, M.D.
and
Charles Y. Brown, M.D., Philadelphia

The antirheumatic effect of cortisone administered arenterally or orally has been documented in numerous eports[1] during the past two years, but little has been vritten about cortisone administered locally into the arhritic joint. Apparently Thorn[2] was the first to instill an drenal cortical hormone directly into a rheumatoid arhritic joint. Early in 1950 he injected 10 mg. of hydroortisone (17-hydroxycorticosterone or compound F) nto the inflamed knee of a patient with rheumatoid arhritis and noted a prompt local alleviating effect. Since this was coincident with a general improvement in the condition of the patient, it was felt that the action was systemic and no further experiments were conducted along this line.

Cortisone has been used locally with encouraging results in various inflammatory diseases of the eye.[3] Some reports have claimed benefit from direct application of cortisone in certain skin diseases.[4]

Since a locally used anti-inflammatory agent could be valuable in the treatment of an arthritic process, particularly when only one or a few joints are affected, two of

us (J. L. H. and E. M. B.) and Stoner [5] attempted to utilize cortisone by injecting 25 mg. of the suspension directly into the inflamed knee joint in seven patients with rheumatoid arthritis. Three of the seven patients said they had improvement in symptoms the day following the injection. The subjective improvement lasted only 24 hours, and objective measurements failed to demonstrate any consistent change in the condition of the injected joint. Despite the suggestion that the locally injected cortisone had some beneficial action in the three patients, the action was too transient and of insufficient degree to be of practical value. Freyberg and others [6] also injected cortisone locally into the knee joints of eight patients in amounts up to 50 mg. Although the benefit seemed more consistent than the results just mentioned, the effect again was too transient and inadequate to be of practical value in most cases.

The reports of Mason and others [7] suggested the hypothesis that hydrocortisone rather than cortisone might be the principal corticoid with anti-inflammatory activity at the tissue level. When hydrocortisone became available through Merck and Company [8] in January, 1951, it was decided to attempt local administration of the hormone and to compare its effect with that of cortisone in the rheumatoid arthritic joint.

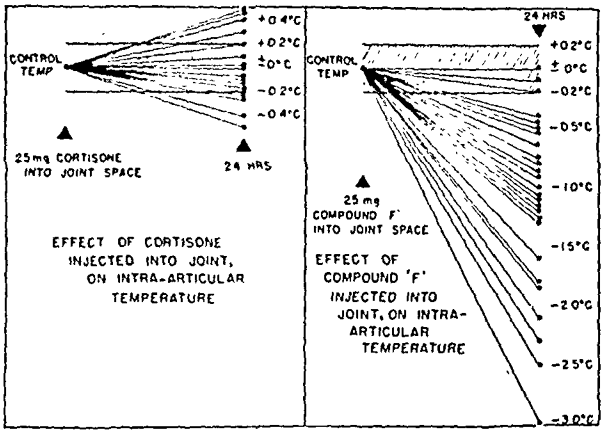

Fig. 1.—Comparative effects of cortisone (left) and hydrocortisone (right) on the joint temperature 24 hours after the intra-articular injection of each. Control temperatures are represented as the zero point, and the change after 24 hours is expressed in centigrade degrees above or below the control. Each slope represents a single study. The shaded area shows standard deviation.

COMPARISON OF EFFECTS OF CORTISONE AND HYDROCORTISONE USED LOCALLY IN RHEUMATOID ARTHRITIS

Patients chosen for the comparative study were those with active rheumatoid arthritis involving both knees, since these joints are most easily injected. The contralateral knee served as an untreated control when either cortisone acetate or hydrocortisone acetate suspension was administered into one joint. Since patients with rheumatoid arthritis are extremely suggestible, questioning as to symptomatic improvement was minimized. Evaluation of effect was based on measurement of circumference, degree of tenderness, and range of motion. In 43 instances additional data were obtained by performing cell counts of the synovial fluid obtained by daily aspiration of the knees and daily determinations of the intra-articular temperature.[9] The intra-articular temperature has been shown to reflect changes in joint inflammation.[10]

METHOD FOR INJECTION

The skin over the anteromedial surface of the knee was cleansed with alcohol, and a 20-gage needle (on a dry syringe) was quickly inserted into the synovial cavity. Procaine infiltration of the tissues was only necessary when the joint contained little excess fluid. The withdrawal of even a few drops of synovial fluid proved the entrance of the needle into the joint space. The needle was left in place and the aspirating syringe replaced by a second syringe, into which the desired amount of cortisone or hydrocortisone suspension had been drawn. The hormone was injected gently. The plunger was slightly withdrawn to be sure the needle was still in the joint space, and even "pumped" a few times to assist the mixing of the suspension with the synovial fluid. The needle was then withdrawn, and the joint was moved a few times to assist mixing. A small sterile dressing was placed over the site. The patient was then allowed to go about his usual activities.

RESULTS

Twenty-five milligrams of cortisone acetate was injected intra-articularly in each of 17 tests on 12 patients with rheumatoid arthritis. No significant improvement in the physical signs of the inflamed joint was detected in any case throughout the subsequent week of observation, but there was subjective benefit in five. Larger doses of cortisone (50 to 60 mg.) in four instances only produced local irritation of the synovium with temporarily increased discomfort and swelling.

With the use of cortisone there was no marked reduction in the synovial fluid cell count in any instance, nor was there significant depression of the intra-articular temperature (Fig. 1). In two tests after local cortisone administration a fall of 0.5 C (0.9 F) in joint temperature was noted. Four tests showed a rise up to 0.5 C, and 11 showed no significant change. The mean difference is zero.

On the other hand, in 178 studies on 51 patients hydrocortisone acetate in doses of 25 mg. was injected into the joint space. After each injection there was significant improvement in swelling, tenderness, and freedom of motion within 24 hours. Because of difficulty in obtaining enough synovial fluid at this time, cell counts 24 hours after injection could be performed in only seven instances. In six of the seven the total cell count was reduced 50% or more. The most demonstrable effect of the administration of hydrocortisone was the depression of joint temperature in the treated knee as compared with that in the contralateral untreated knee. This was studied in 26 instances (Fig. 1).

The effect of hydrocortisone on intra-articular temperture is illustrated in the right half of Figure 1. Significant alls in temperature from 0.4 C (.72 F) to 3.0 C (5.4 F) ollowing an injection were seen in 23 of 26 instances. The mean temperature fall was 1.1 C (1.98 F). The Figre does not show that in two of the three cases in which

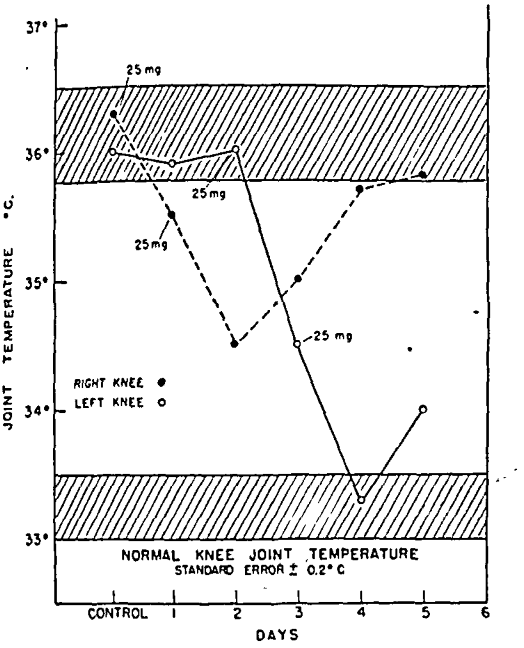

Fig. 2.—Effect of hydrocortisone injected into rheumatoid arthritic ints (knees) on the joint temperature. Upper shaded area shows standard viation; lower shaded area represents normal knee joint temperature.

o significant fall occurred a subsequent injection of 7.5 mg. of hydrocortisone into the joint produced a gnificant fall.

Figure 2 shows the typical effect of repeated injections f hydrocortisone into the knee on the joint temperature. he patient's left knee was used as a control and showed o change, while the temperature of the right knee was gnificantly reduced by each of two injections of hydroortisone on successive days. On the following two days he hydrocortisone was injected into the left knee, proucing marked reduction in joint temperature, while the ght knee temperature returned to the pretreatment level our days after the last injection into it. Figure 2 graphially illustrates the local effect of the hydrocortisone, since ne control knee temperature showed no change. Symptoatically, the control knee was likewise unaffected by njections of hydrocortisone into the opposite knee, nor were general metabolic effects noted.

Figure 3 illustrates a somewhat similar study on another patient and shows that use of at least 25 mg. of hydrocortisone is usually necessary to produce the effect on joint temperature. Here again the left knee served as a control, while the right was injected with increasing doses of hydrocortisone; then the right knee returned to pretreatment temperature as the left was treated.

Sixty-nine patients with rheumatoid arthritis have now been observed for as long as nine months following injections of hydrocortisone into one or more joints, repeated as often as necessary to continue the beneficial effect. A brief summary of results following individual injections is presented in the table. From the table it will be observed that there was considerable variation in degree of benefit obtained, and also in the duration. Injections were usually not repeated until the benefit from the previous hydrocortisone instillation had worn off (i. e., the inflammation was returning to the pretreatment state). In 18 instances another inflamed joint (ankle, shoulder, elbow, hip, wrist, or finger) was injected. The results were similar to those obtained in the knee.

For 11 cases, in which the joint involvement was severe, use of 37.5 mg. of hydrocortisone was necessary to produce an effect of sufficient degree and duration to be of practical value. Still larger doses have been utilized, but they have not so far proved more beneficial. Relapse following the period of beneficial effect was gradual, with swelling and limitation of motion often recurring to the degree originally noted before marked pain and stiffness returned. This relapse, though apparently inevitable, has never appeared worse than the pretreatment arthritic state in this series of cases. Alleviation from repeated injections usually equaled or even exceeded the original effect, even after as many as 17 reinjections. In two patients, however, successive injections have produced diminishing responses, necessitating increased dosage to maintain benefit.

Since it appeared that hydrocortisone acetate had a consistent anti-inflammatory effect on the rheumatoid arthritic joint when administered locally, whereas cortisone acetate did not, furfher studies were undertaken to determine whether solubility of the preparations was responsible for the difference. Whereas hydrocortisone is slightly more soluble than cortisone acetate in water, much more soluble forms of cortisone (namely, the free alcohol of cortisone and cortisone tricarballylate) appeared no more effective than cortisone acetate in nine experiments.

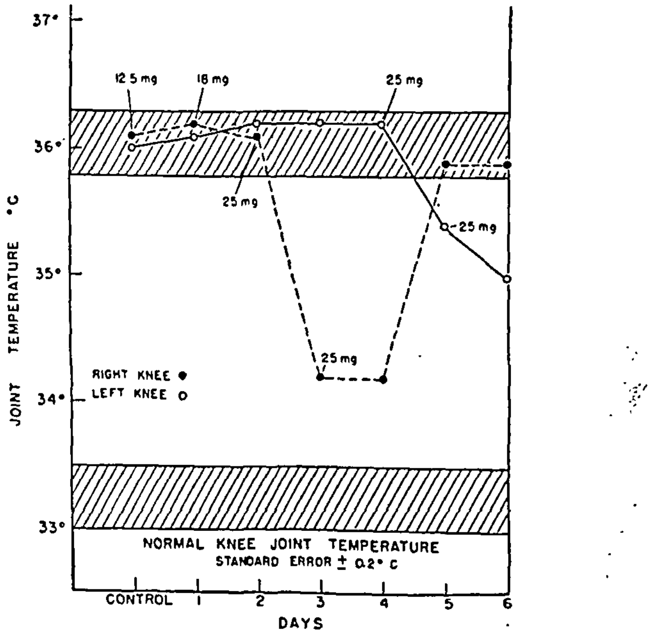

Fig. 3.—Effect of injecting increasing doses of hydrocortisone into rheumatoid arthritic joints (knees) on the intra-articular temperature.

It has recently been determined[11] that hydrocortisone, though somewhat more soluble in water than cortisone, is less soluble in blood plasma. Cortisone acetate is soluble in proportions up to 16 mg. per 100 cc. of plasma; whereas, hydrocortisone acetate is soluble in proportions up to 2.2 mg. per 100 cc. Thus, cortisone acetate is actually more than seven times more soluble in plasma. Since this same situation would presumably obtain with synovial fluid, it is possible that the relative insolubility of hydrocortisone enhances the local effect by slower dispersion from the joint.

Results Following Single Hydrocortisone Injection into Arthritic Joints (or Other Areas of Inflammation)

Diagnosis and Joint Injected	No. of Cases	Dosage (Mg.)	Degree of Local Improvement *	Duration of Beneficial Effect
Rheumatoid arthritis:				
One or both knees	62	25 in 51 37.5 in 11	4+ in 13, 3+ in 35 2+ in 12, 1+ in 2	Shortest 2 days (in 2), longest 10 weeks (in 1), average 8 day
Ankle	4	25	4+ in 1, 3+ in 1, 2+ in 2	3 days-4 mo., average 12 day
Elbow	4	15-20	3+ in 2, 2+ in 2	2-13 days, average 6 days
Shoulder	3	25	3+ in 2, 2+ in 1	4-17 days, average 10 days
Hip	3	25	4+ in 1, 2+ in 2	3-27 days, average 13 days
Wrist	3	15	2+ in 2, 0 in 1	0 in 1, 5 days in 1, 11 days in 1 average 5 days
Metacarpophalangeal	1	10	3+	13 days
Osteoarthritis:				
One or both knees	37	25	4+ in 22, 3+ in 14, 2+ in 1	Shortest 6 days in 1, longest over 5 mo., in 2 (to date average 3 weeks +
Hip	2	25	3+ in both	7-13 days, average 10 days
Terminal phalangeal (Heberden's node)	2	5	3+ in 1, 2+ in 1	5-15 days, average 10 days
First metatarsophalangeal	1	10	4+	6 weeks (continues to date)
Acute traumatic arthritis (sprain):				
Knee	3	25	4+ in 1, 3+ in 2	Continues to date (4 mo. in 2 mo. in 1, 6 weeks in 1)
Acute gouty arthritis:				
Knee	2	25	4+ in both	Continues to date (10 weeks 1, 7 weeks in 1)
Bursitis:				
Acute subdeltoid	3	15-25	4+ in all	Continues to date (4 mo. in 3 mo. in 2)
Chronic subdeltoid	7	15-25	3+ in 3, 0 in 4	Continues to date (3-4 mo.) 3, 0 in 4
Olecranon	2	25	4+ in 1, 3+ in 1	Continues to date (12 and weeks)
Prepatellar	1	25	4+	Continues to date (5 mo.)
Disseminated lupus erythematosus:				
Knee	1	25	4+	Continues to date (9 weeks)
Pleural cavity	2	100	4+ in both	5 mo. + in 1, 4 mo. in 1
Rheumatoid arthritis with eye inflammation:				
Chronic episcleritis	3	1 drop q. i. d. (Suspension of 5 mg. per cc.)	3+ in 2, 0 in 1	Maintained as long as drop continue (16 weeks in 1, weeks in 1)
Sjögren's syndrome	1	1 drop q. i. d.	3+	Maintained with drops (15 week

* 4+ benefit: local complete remission—complete absence of pain, *swelling*, *tenderness*, or limitation of function. 3+ benefit: complete rel symptoms, marked reduction of tenderness and swelling, *markedly* improved function. 2+ benefit: marked reduction of pain and stiffness, definite tion of swelling and tenderness, function improved. 1+ benefit: lessening of pain and stiffness, some decrease in swelling and tenderness, little c in function. 0 benefit: includes cases with only subjective or no improvement.

In 13 patients a comparison was made between the anti-inflammatory effect of hydrocortisone acetate and the effect of the more soluble free alcohol of hydrocortisone.[12] With the use of identical doses there appeared no difference in degree or duration of benefit obtained from local injection of the two preparations into the rheumatoid arthritic joint.

LOCAL ADMINISTRATION OF CORTISONE AND HYDROCORTISONE IN OTHER CONDITIONS

Although in our experience, as well as in that others,[13] hydrocortisone administered systemically h been no more effective than cortisone or corticotro (ACTH); the much more pronounced local effecti ness of hydrocortisone suggested certain therapeutic p sibilities. This preliminary report covers the results the empirical local administration of hydrocortisone 129 patients, including not only the 69 with rheumat arthritis but also 39 with osteoarthritis (degenerat joint disease), 13 with bursitis, 3 with acute diss nated lupus erythematosus, 4 with inflammatory disease associated with rheumatoid arthritis, 2 with a gouty arthritis, and 3 with acute traumatic arth (sprain). Nearly 700 local injections have now administered to the 129 patients, and as yet no untov effects have been observed. A summary of the dat tabulated in the table.

Results in Osteoarthritis.—In an effort to determ whether hydrocortisone was "antirheumatic" or sin a nonspecific anti-inflammatory agent, injections made into the joints of patients with osteoarthritis ither forms of joint disease. Results are summarized in he table.

[13] Polley, H. F., and Mason, H. L.: Rheumatoid Arthritis: Effects of Certain Steroids Other than Cortisone and of Some Adrenal Cortex Extracts, J. A. M. A. **143**: 1474-1481 (Aug. 26) 1950.

Systemic cortisone or corticotropin therapy has been eported helpful in some cases of osteoarthritis,[14] but the sual benign course of this prevalent condition makes the dvisability of utilizing these agents doubtful because f expense and possible dangers, particularly in persons ast middle age—the very group suffering from osteorthritis.

Hydrocortisone acetate was injected into the osteorthritic joints of 39 patients. Since the knees are freuently troublesome, and are most easily injected, these ints were most frequently studied. Acute inflammation seldom seen in osteoarthritis, so the criteria for imrovement are not as sharply defined as in rheumatoid thritis. It seems significant, however, that in 36 out of 7 instances a complete or nearly complete disappearnce of symptoms and complete return of normal work lerance was noted within 24 hours after the injection of 5 mg. of hydrocortisone into the painful joint. The duraon of relief in these cases was several times as great in cases of rheumatoid arthritis (usually three weeks longer) and often persisted until the patient abused the fected joint in some way. Reinjection was made wheneer the symptoms recurred.

For comparison of effects, cortisone acetate in doses 25 mg. was substituted for hydrocortisone, without e patient's knowledge, in 22 instances. In no instance as the marked alleviation previously noted after hydrortisone injection reduplicated by use of cortisone. All e patients commented on this lack of effectiveness, inking the drug had lost its beneficial action on them. hey were persuaded to submit to an additional injection, is time of hydrocortisone. The beneficial action was gain obvious in everyone.

In two patients with unilateral osteoarthritis of the hip nalum coxae senilis), hydrocortisone was injected into e diseased joint. Both of these were elderly women who id previously failed to respond appreciably to systemilly administered cortisone.[15] A prompt alleviation of mptoms and improvement in range of motion and funcon was noted in both after 24 hours; this persisted 7 ys in one and 13 days in the other. Reinjection is being rried out periodically in both instances, as symptoms appear, but longer observation is needed before conusions can be drawn concerning long-range practicabily and benefit in such cases.

Results in Acute Traumatic Arthritis.—In three paents an acute swelling of the knee with effusion, which llowed known injury, was treated by aspiration, injecon of 25 mg. of hydrocortisone, and application of an lastic bandage. Although such conditions are frequently elieved by aspiration, rest, and support without the use f a hormone locally, the striking observation in these atients was the complete absence of pain, tenderness, nd swelling, which was noted within four hours of the ime of treatment and which has continued four months, wo months, and six weeks, respectively (to the time of vriting). No control studies with cortisone were made.

Results in Acute Gouty Arthritis.—Local use of ydrocortisone certainly would not be expected to alter he metabolic derangement occurring in cases of this disase. The desire to study the range of effectiveness of the hormone led to its trial in two patients with typical gout, one in the late tophaceous stage who had an acute exacerbation in the knee and the other with an acute gouty knee which had responded only moderately to colchicine administration. In each instance a complete amelioration of symptoms and signs was noted in the affected knee within 24 hours of the intra-articular injection of 25 mg. of hydrocortisone. In neither patient has the inflammation recurred so far, but routine interval management of gout has been carried out in both. No control injections of cortisone were attempted.

Results in Bursitis.—The similarity of inflammation of bursal sacs to that of joints has long been known. Empirically an attempt was made to treat bursitis with local injections of hydrocortisone into the bursal sac. Of the 13 patients observed, 3 had acute subdeltoid bursitis of only a few days' duration, 7 had chronic subdeltoid bursitis, of which 5 showed calcium deposits on x-ray, 1 had bilateral olecranon bursitis with rheumatoid arthritis, 1 had unilateral acute traumatic olecranon bursitis, and 1 had chronic traumatic prepatellar bursitis.

In all three cases of acute subdeltoid bursitis it was possible to aspirate a little fluid from the bursa, so it was assumed that the 15 mg. of hydrocortisone injected actually entered the bursal sac. Within three hours in each instance there was complete alleviation of pain and tenderness, and full range of shoulder motion was possible without pain. This relief has persisted to the time of writing—four months in one case and three months in the others. No other therapy was utilized. Local injection of cortisone into the inflamed bursae of two previous cases had produced no such benefit.

The results in chronic subdeltoid bursitis, however, have been much less satisfactory. In these cases it was impossible to be sure the hormone was injected into the bursal sac. Three of the patients experienced an almost complete relief of pain and return of normal range of shoulder motion after a single injection of hydrocortisone. In the other four instances, however, no relief was obtained even after repeated trials, and in two the shoulder pain was reported worse for several days after each injection.

In the case of bilateral chronic olecranon bursitis there were small rheumatoid nodules present around the margins of the sacs. The bursae contained several cubic centimeters of fluid, which was aspirated, and 25 mg. of hydrocortisone was injected into each. After this procedure the bursal effusion disappeared, and the ring of rheumatoid nodules became softer and smaller. No recurrence has been observed after six weeks. The effusion and tenderness in the olecranon bursa of the patient who had traumatized his elbow disappeared promptly after the instillation of hydrocortisone and have not recurred even after three months.

The patient with chronic prepatellar bursitis, or "housemaid's knee," obtained prompt relief and has had no recurrence of bursal effusion or tenderness five months after the injection of hydrocortisone, even though she has continued to kneel while working.

[15] Brown, C. Y.; Jessar, R. A., and Hollander, J. L.: Cort Treatment of Osteoarthritis of the Hips, J. A. M. A. 147: 55 6) 1951.

Not included in the summary of results is one case of a ganglion, or synovial hernia, of the wrist, into which 20 mg. of hydrocortisone was injected, with prompt disappearance of the enlargement. There has been no recurrence after eight weeks of observation.

Results in Disseminated Lupus Erythematosus.—Although local measures in this systemic disease are merely palliative, an acute exacerbation in a joint or in a serous cavity was considered worthy of local hydrocortisone administration, at least for trial.

Two young women with severe disseminated lupus erythematosus had a persistently recurring pleural effusion severe enough to embarrass respiration and requiring repeated chest aspiration for removal of the excess fluid. Both these patients had been receiving systemic cortisone therapy for some months, with fairly adequate control of the fever and joint pain.

In the first patient the left pleural cavity, which had required aspiration at least weekly, was again drained of 750 cc. of fluid. One hundred milligrams of hydrocortisone suspension was mixed with 50 cc. of the pleural exudate, which was then injected into the pleural cavity without adverse reaction. Systemic cortisone therapy has been continued. There has been no reaccumulation of the effusion in the left side of the chest after five months. The fluid in the right side of the chest, which had always reaccumulated much more slowly, gradually diminished also during the observation period.

The second patient had not required chest aspiration as frequently as the first patient, and both pleural cavities reaccumulated fluid at about the same rate. The left side of the chest was aspirated, 600 cc. of fluid removed, and 100 mg. of hydrocortisone injected. The right side of the chest was also aspirated and 500 cc. removed, but no hydrocortisone was injected. After two weeks the right side of the chest, by fluoroscopic examination and physical signs, showed reaccumulation of fluid as before, but the treated left side showed no fluid. The right side of the chest was then aspirated and 100 mg. of hydrocortisone injected. Recurrence of fluid has just been noted in both pleural cavities after four months. Reinjection has been successfully accomplished. Systemic cortisone therapy has been continued. No local cortisone injections into the chest cavity have been tried so far.

In the third patient with disseminated lupus erythematosus, in addition to her other symptoms, an acute swelling of the left knee had recently developed. This was aspirated and 25 mg. of hydrocortisone injected. Within 12 hours all signs of the local inflammation had subsided, with no return as yet (9 weeks).

Results in Inflammatory Eye Disease with Arthritis.—One patient with Sjögren's syndrome (keratoconjunctivitis sicca) and three with chronic episcleritis as complications of rheumatoid arthritis were treated with eye drops of hydrocortisone, since topical and parenteral cortisone therapy had failed to relieve the inflammation. The drops contained 5 mg. of hydrocortisone per cubic centimeter (1:5 dilution of the standard suspension with isotonic sodium chloride solution).

In none of the four patients was improvement rapid, often requiring a week or 10 days to become evident.
One of the four showed no improvement after th
weeks, so the treatment was discontinued. In three of
four patients the subsidence of inflammation by the
of two weeks was obvious. In the patient with Sjögr
syndrome the punctate ulcerations on the cornea c
pletely disappeared, and the lacrimal secretion actu
increased to overabundance. In the two patients
chronic episcleritis the conjunctival inflammation alm
completely disappeared, vision improved, and the sy
toms were relieved as long as the drops were contin
but recurred within a week when cortisone drops
substituted.

COMMENT

The reason for the difference in effectiveness betw
cortisone and hydrocortisone given locally is unkn
Since hydrocortisone is only one-seventh as solub
plasma as cortisone, it might diffuse less rapidly
thus become a local "reservoir" of anti-inflamm
hormone within the joint space. However derived,
certainly is a physiological difference between the
mones, at least at the tissue level.

The failure of hydrocortisone to produce an a
ciable antiarthritic effect when injected outside the
vial sac is probably because such injections do not
all the inflamed synovial tissue.

Whereas in patients with rheumatoid arthriti
systemic nature of the disease and usual multip
of involved joints would often make local therap
practical, in the following types of patients therap
benefit from injection of hydrocortisone into one or
involved joints has been observed: (1) those pa
with only one or two peripheral joints involved
those in whom only a few peripheral joints were
actively inflamed, even though others have been
losed; (3) those in whom use of cortisone or co
tropin was contraindicated because of psychosis,
tension, cardiac decompensation, nephritis, tuberc
etc., or because of economic inability to permit
therapy (in such instances the local injections re
the symptoms in a few of the worst joints); (4) th
whom use of cortisone or corticotropin has had
withdrawn because of insufficient effect, untoward
tions, or for economic reasons (in such patients the
alleviation of symptoms in the worst joints tapere
effects of withdrawing hormone treatment); (5)
in whom use of cortisone or corticotropin has pro
a desirable amelioration of rheumatoid arthritis e
in a few of the most severely involved joints (in
patients the systemic therapy with hormone was
tinued, and hydrocortisone was administered pe
cally into the resistant joints as supplementary
ment); (6) those in whom a sudden exacerbati
inflammation has occurred in one or a few joints
whom orthopedic correction of joint deformity had
or was to be, undertaken (in these patients the m
served as an aid in local rehabilitation).

That the beneficial effect of use of hydrocort
locally is nonspecific is borne out by its effectiven
a variety of inflammations from different causes. A
ently this method offers no cure for the inflamm
process, and hydrocortisone may merely be an all
ing agent which temporarily suppresses the local rea
to an irritant. Diagnosis must obviously be establ

efore this method is used, particularly if an infectious tiology is suspected. Use of local hydrocortisone may e contraindicated in the presence of infection, unless pecific antibiotics are used concomitantly..

In the arthritic patients included in this report, only upportive therapeutic procedures have been utilized conomitantly with the local hydrocortisone injections, uness otherwise specified. The method has so far proved f little value in patients with spinal joint involvement or hen many peripheral joints are inflamed.

Before this method for producing amelioration of ocal inflammation can be called a practical aid in mangement of disease, it must stand the test of time. In both heumatoid arthritis and osteoarthritis the local use of ydrocortisone has proved of practical value on repeated njection for periods up to eight months in a relatively rge series of patients. The long-range effect must still e determined, but certainly there have been no detriental effects as yet observed.

It is more difficult to draw conclusions from the results f local therapy with hydrocortisone in the other condions treated. The periods of observation have been short, nd the number of patients in each disease group insuffiient. Nevertheless, these early encouraging results sugest a much more widespread usefulness for locally dministered hydrocortisone, which certainly warrants rther clinical investigation.

It appears likely that hydrocortisone will become vailable to the physician within a relatively short time, ven though present supplies are insufficient for all exerimental needs. The amount needed for local injection, bout 25 mg. per joint per week, would be so small that e cost should present no great economic problem to e patient.

SUMMARY

Injected locally, hydrocortisone (17-hydroxycorticosterone or compound F) is much more effective than cortisone in suppressing the synovial inflammation of rheumatoid arthritis. The reason for this difference is unknown. Nearly 700 injections of hydrocortisone have been made into the joints of 129 patients without untoward effects. In 69 patients with rheumatoid arthritis injection of hydrocortisone into one or more joints has resulted in prompt local alleviation of symptoms and signs. The completeness of improvement has varied considerably, and the duration of benefit from each injection has varied from a few days to several weeks. Repeated injections have been equally effective. In 39 patients with osteoarthritis, injections of hydrocortisone into one or more joints has resulted in prompt relief of symptoms and signs. There has been consistently greater relief for longer periods in this condition than observed in rheumatoid arthritis. Repeated injections are equally effective and may maintain remission of symptoms for long periods. Preliminary trials with use of hydrocortisone locally in cases of various forms of bursitis, gouty arthritis, disseminated lupus erythematosus, traumatic arthritis, and ocular inflammations complicating rheumatoid arthritis have been encouraging. There has been an absence of systemic effects and adverse reactions from this local method of utilizing hydrocortisone. Cessation of injections has not been followed by exacerbations of the local inflammation but only by gradual relapse to pretreatment status. These observations suggest that the local administration of hydrocortisone may be of practical value in the management of certain local inflammatory states.

MANAGEMENT OF TETANUS

EFFECT OF PENICILLIN ON CLOSTRIDIUM TETANI IN VIVO

R. S. Díaz-Rivera, M.D., Emilio Ramirez, M.D., Eduardo R. Pons, Jr., M.D.
and
Mercedes V. Torregrosa, Ph.D., San Juan, Puerto Rico

The most important objectives in the management of etanus are: (1) neutralization of free toxin with tetanus ntitoxin; (2) elimination of the source of toxin by ébridement of all accessible portals of entry or by adninistration of antibiotics; (3) prevention of convulions and severe muscle spasms by use of sedatives, nesthetics, or such muscle relaxants as curare preparaions and, preferably, mephenesin; (4) maintenance of fficient hydration and of electrolyte balance; (5) mainenance of proper nutrition, and (6) prevention and treatment of pulmonary complications through maintenance of unobstructed air passages by mechanical means and by administration of antibiotics.

Most observers [1] agree that 50,000 units of tetanus antitoxin given intravenously is a dose large enough to neutralize all the unfixed or free toxin in any patient with a chance of recovery. Since it is impossible to ascertain whether fixation of the toxin by the cells of the central nervous system is progressing, and since symptoms may arise from fixation of a sublethal dose of toxin, it is advisable to administer 10,000 units of antitoxin intramuscularly for the first four or five days. This prevents fixation by the central nervous system of a dose sufficiently large to be fatal. The latter aspect of tetanus treatment has been discussed by Firor and colleagues,[1e] Schumacker and others,[1f] Firor himself,[1g] and Firor and Jonas.[1h] Administration of 200,000 units of tetanus antitoxin intrathecally, although of great benefit, is impractical, since general anesthesia or curarization is required in the majority of severe cases of tetanus presenting fre-

quent convulsions and opisthotonos. Besides, tetanus antitoxin may lead to untoward reactions when given by this route.

The tissues around the portal entry should be infiltrated with 10,000 units of tetanus antitoxin, and after one hour débridement with wide excision of all the necrotic tissue at the portal of entry is advisable. The antitoxin will neutralize the toxin in the lesion and around it, thus preventing its diffusion and dissemination during débridement. Removal of necrotic tissue will reduce the multiplication of Clostridium tetani, and exposure of the lesion to air may help in altering the metabolism of the bacillus, since it is an anaerobic saprophyte.[2]

Treatment of convulsions is always a major problem in severe cases. Phenobarbital (luminal®) sodium in intramuscular doses of 0.13 gm. every two or three hours is beneficial. Large rectal doses of chloral hydrate, paraldehyde, or ether in oil can be used. Simple methods failing, the physician may resort to such muscle relaxants as mephenesin or curare preparations, but their use requires constant medical attention and the administration of the latter is fraught with danger.

The patient with tetanus loses great amounts of water and sodium chloride by perspiration and respiration. This, coupled with dysphagia, leads, in severe cases, to extreme dehydration. Although it is not always possible to measure the fluid and electrolyte requirements in every case of tetanus, the daily intravenous administration of 2,000 to 4,000 cc. of isotonic sodium chloride solution will prevent clinical signs of dehydration and acidosis in most cases.

The extreme restlessness, convulsions, fever, and overwhelming toxemia observed in severe cases of tetanus lead to an increase in body metabolism, with a corresponding increase in caloric requirements. In many instances the addition of 5% dextrose to the intravenous fluids suffices, but markedly debilitated patients may require feeding by stomach tube. The feedings should consist of substances yielding readily usable calories, such as carbohydrates. The constant pressure of the stomach tube in the nasopharynx, however, may increase the frequency and severity of the convulsions, provoke severe and prolonged laryngeal spasms, and lead to overproduction and aspiration of secretions, all of w might result in pulmonary complications.

Preventing pulmonary complications is mainly a chanical problem. The cough reflex is depressed, the respiratory excursions are limited; strong seda increases the likelihood of aspiration of secretions f the upper respiratory tract. The respiratory path can be maintained patent by frequent suction, raising foot of the bed for drainage, and, in the severest case tracheotomy. Removal of secretions may prevent d from asphyxia or aspiration pneumonia.

If there is no response to frequent suction and i recurrent spasms of the thoracic and laryngeal mu cannot be controlled, tracheotomy should be resorte This procedure, done under local anesthesia, will p by-passing of the secretions of the mouth, pharynx larynx; it will neutralize the effects of the lary spasms and will permit the direct removal of secre already aspirated into the trachea and bronchi. I also allow direct flow of oxygen into the lungs thr the tracheal tube, by-passing the obstruction caus laryngeal spasms, and will render the use of a resp more practical in case of impending respiratory par

Since not all portals of entry are accessible and not all accessible portals can be properly débrid specific antibiotic is needed. Eradication of the te bacillus eliminates the very source of productio diffusion of tetanus toxin. Removal of other ba sensitive to antibiotics from the infected wound tributes to improvement in the healing processes may lead to further interference with the metabol quirements of Cl. tetani. The role of a potent anti in prevention and management of pulmonary com tions is also emphasized.

Penicillin has been recommended as a valuable vant in the management of tetanus for its effect i venting secondary bacterial infections and on the g and multiplication of Cl. tetani at the portal of e Since there is enough evidence to show that penici an antibiotic for Cl. tetani,[4] we have been promp study the behavior of the bacillus in vivo when p doses of the drug are administered.

MATERIAL AND METHODS

From November, 1948, to January, 1950, 32 pa suffering from tetanus were admitted to the San City Hospital. Seventeen, in whom repeated cultur Cl. tetani were made, were selected for the present There were 11 white patients, of whom six were me five women; three Negroes, two men and one wo and three mulatto men. The youngest was 13 yea and the oldest 82, with an average of 31 years. were eight patients of 20 or younger, 12 under 3 under 40, 15 under 50, and two over 70.

The approximate incubation period was known instances: in three it was five days; in one, five days; in two, 10 to 15 days, and in four, 15 to 21 The average was 12.2 days.

The portal of entry was evident in all: in the f eight; in the ankle in three; in the leg in four; in th in one, and in the neck in one. The nature of the l was discovered in all: puncture wounds in six; la

ions in two; ulcers in six; a draining abscess of the neck n one; a draining ear in one, and a burn in one.

The disease was classified as generalized tetanus in 15 and cephalic tetanus in two. Fifteen had convulsions, ither on admission or afterward. The time between the nset of the disease and the appearance of convulsions vas known in 12 cases; in two within the first day; in wo within two days; in two within three days; in three vithin four days; in one within five days; in one within ix days, and in one within nine days.

On admission all patients received 100,000 units of etanus antitoxin intravenously and an equal amount ntramuscularly after a negative reaction to a dermal test or sensitivity. After infiltrating the surrounding tissues vith 10,000 to 20,000 units of tetanus antitoxin, tissue nd other material, including pus when present, were obained from the portal of entry for anaerobic culture of l. tetani in thioglycolate and cooked meat media. No ide or extensive débridement was attempted; the ound was left open, and was covered with sterile gauze. o local medication was tried. Crystalline sodium penillin G (Squibb) was then administered in doses of 0,000 units intramuscularly every three hours, and the tal dose of the drug was not limited. Two thousand 4,000 cc. of 5% dextrose in isotonic sodium chloride lution was given intravenously in accordance with the atient's needs for hydration, and phenobarbital sodium doses of 0.13 gm. or more every two or three hours as given hypodermically for the control of convulsions.

aily intramuscular injections of 10,000 units of tetanus ntitoxin were administered for three consecutive days fter admission. Anaerobic cultures from tissue and pus btained from the portals of entry were made 24, 48, 72, nd 120 hours after the initiation of therapy. In one case, umerous cultures were done in a period of 30 days.

RESULTS

There were eight positive and nine negative cultures initially; of the positive, five were negative 24 hours later and thereafter; two were positive at the end of 48 hours; of the latter two, one was negative in 72 hours and the other in 29 days. Of the negative initial cultures, one was reported as positive 48 hours later, but it was negative in 72 hours (Table 1).

Thus, 47% of the cases showed positive cultures on admission; 18% in 24 hours; 18% in 48 hours; 6% in 72 hours, and 6% in 120 hours after the initiation of treatment with penicillin. Sixty-two per cent of the positive cultures were negative within one day, 75% within the second day, and 87.5% within the third day (Table 1).

The average duration of lesions yielding positive cultures was 12.5 days; of those with negative cultures, more than two years. It appears from this that the older the lesion the more difficult it is to recover Cl. tetani. Extensive ulcers and a burn covering a large area failed to yield positive cultures, while in the well-localized lesions the bacillus was easily found. However, there were two instances of deep puncture wounds in the sole of the foot with negative cultures. Demonstration of positive cultures was as follows: lacerations yielded 100%; suppurating lesions (an incised abscess of the neck and an acute otitis media), 100%; puncture wounds, 66.6%, and the ulcers and a burn 14.3%. It can be concluded that recent, well-localized, small, shallow, suppurating lesions are richer and more available sources of Cl. tetani than are extensive, chronic, or very deep lesions. The taking of material for culture from multiple areas in extensive lesions may have led to positive cultures in some of our cases, since in these the exact point where the bacillus was multiplying was very difficult to ascertain. Débridement with excision of tissue from the very depths of the puncture wounds may have helped in the isolation of Cl. tetani (Tables 2 and 3).

Cultures for Cl. tetani remained positive for 29 days in one patient. A summary of the clinical course is included to illustrate the many factors involved in eradicating an infection with this organism.

REPORT OF CASE

CASE 1.—J. S. L., a 38-year-old white, Puerto Rican vendor, [illegible] a puncture wound in the sole of with a [illegible] on April 6, 1949. On April 1 dysphagia, trismus, and painful spasms of the muscles of the neck, abdomen, and legs. On April 17 frequent generalized convulsions appeared, forcing his admission to the hospital on April 20. His past and family histories were noncontributory. He denied having received tetanus antitoxin or penicillin during, or prior to, his present illness.

Physical examination revealed a well-developed, poorly nourished white man presenting marked rigidity of the cervical muscles and a risus sardonicus. The temperature was 99.2 F., the pulse 120, the respirations 28 per minute, and the blood pressure 120/94. The muscles of the back, abdomen, and legs were markedly spastic, and the patellar, ankle, biceps, and triceps reflexes were hyperactive. A hardened, cornified area about 2 cm. in diameter was found in the sole of the left foot; in the center of this area was a partially healed, small puncture wound draining small amounts of pus. There were frequent generalized convulsions during the examination.

The red blood cell count was 5,160,000 with 103% hemoglobin. The white blood cell count was 11,200 per cubic millimeter, with normal differential values. The urine was normal, except for traces of albumin.

The patient received 100,000 units of tetanus antitoxin intravenously and 100,000 units intramuscularly on admission. He was given phenobarbital sodium in doses of 0.13 gm. intramuscularly every three hours, and 4,000 cc. of 5% dextrose in isotonic sodium chloride solution intravenously every 24 hours. Ten thousand units of tetanus antitoxin were administered intramuscularly for each of three consecutive days. The tissues around the suspected portal of entry were infiltrated with 10,000 units of tetanus antitoxin, and a small piece of the cornified tissue was obtained for culture of Cl. tetani before parenteral administration of 30,000 units of crystalline sodium penicillin G every three hours was initiated.

TABLE 3.—*Summary of Eight Cases with Negative Cultures for Clostridium Tetani*

Case	Age, Yr.	Sex	Race	Portal of Entry	Site of Lesion	Duration of Lesion	Local Penicillin, Units	Pulmonary Complications	Outcome
1	17	M	M	Ulcer	Leg	6 yr.	None	No	Recovery
2	18	M	N	Ulcer	Ankle	10 mo.	50,000	No	Recovery
3	73	M	W	Ulcers	Leg	10 yr.	None	Yes	Death
4	13	F	C	Ulcer	Leg	6 wk.	None	No	Recovery
5	23	F	W	Ulcers	Leg	3 mo.	None	No	Recovery
6	39	F	W	Puncture wound	Foot	14 days	20,000	Yes	Death
7	82	M	M	Puncture wound	Foot	8 days	20,000	Yes	Death
8	30	F	W	Burn	Foot	1 mo.	—	—	Recovery
Average age	37 yr.							Mortality	37.5%

Because of the severity of the convulsions, on April 22 the patient was started on 50 cc. of 2% solution of mephenesin (tolserol®) intravenously every eight hours.[4b] He exhibited little lasting improvement, in spite of its continuous use for 14 days. On April 24 he developed a dry, hacking cough. On April 25 the temperature rose to 102 F., and there were dullness to percussion, diminished breath sounds, and moist rales over the left lower lung posteriorly. At this time he was started on daily intramuscular 1-gm. doses of streptomycin, for eight days.

TABLE 4.—*Results of Cultures for Clostridium Tetani (Case 1)*

Date	Penicillin, I. M.	Penicillin, Local	Streptomycin, I. M.	Culture
April 20	Yes	None	No	*Positive*
April 21	Yes	None	No	Positive
April 24	Yes	20,000 units	Yes	Positive
May 1	Yes	20,000 units	Yes	Positive
May 18	Yes	100,000 units	No	Positive
May 19	Yes	None	No	Negative
May 20	Yes	None	No	Negative

On April 26 the spasticity of the muscles had diminished considerably, and the convulsions were milder and less frequent. During the next 10 days the temperature ranged from 100 to 104 F., and the pulmonary findings persisted until May 7. Sedation was stopped on May 18, and penicillin on May 20, but the trismus and rigidity of the neck muscles remained until June 2. The patient was discharged as cured on June 4, 1949.

The results of cultures for Cl. tetani in this patient are presented in Table 4.

*From the data presented in this case it can be con*cluded that parenteral penicillin failed to eradicate enough Cl. tetani in time to check production of tetanu toxin in an amount *sufficient* to cause serious clinica *manifestations*. Penicillin was also of no value in preven ing the development of aspiration pneumonia, but strep tomycin appears to have helped in curing the latte complication.

The fact that the lesion was located in a cornified are with poor blood supply may explain the failure of paren teral penicillin to check the infection with Cl. tetan since this was not achieved until penicillin was give locally and in heavy doses. The *serious manifestatio* of tetanus in this case suggest that the power of diffusio of tetanus toxin through tissues with a poor blood supp is much higher than that of penicillin, and gives suppo to the advisability of local use of the drug.

Perhaps complete excision of the cornified area wou have been a more satisfactory method of treating t local infection, since the localization of the lesion in area almost *devoid of blood and oxygen supply* mig have contributed to the continued growth of the bacill

The amount of toxin fixed by the central nervous sy tem, although sublethal, was large enough to cause se ous manifestations. The body defenses were responsi for this patient's recovery, aided by the antibioti which checked and prevented secondary infections.

The failure of mephenesin adequately to control co vulsions in this patient emphasizes the variable toleran to the drug. In all probability, heavier doses would ha been more effective.

There was one death among the patients with positi cultures. This fatality will be presented in detail to illu *trate the dangers* of rapid fixation of large amounts tetanus toxin by the cells of the vital centers of the centi nervous system, and the complications that may ensu

REPORT OF CASE

CASE 2.—A. S., a 19-year-old Puerto Rican laborer, had dev opment of a small abscess of the right side of the neck. T abscess was incised and drained in the surgical dispensary of t San Juan City Hospital on Dec. 19, 1949, and the patient turned to work on the same day. On Dec. 21 he developed pa and stiffness of the jaw, and on Dec. 23 dysphagia and rigidi of the cervical muscles. On Dec. 24 the muscles of the back and abdomen were involved, and frequent, generalized, and painful muscle spasms appeared. These increased in severity, forcing his hospitalization on Dec. 25. The past and family histories were noncontributory. He denied receiving penicillin or tetanus antitoxin either before or during his present illness.

On physical examination the patient was found to be in great distress because of marked rigidity of the neck, back, and abdominal muscles, severe trismus, and dysphagia. The temperature was 99 F., the pulse 96, the respirations 30, and the blood pressure 120/80. A dirty-looking, almost completely healed, 1-in. (2.54-cm.) long surgical incision was found in the right submaxillary region. The heart and lungs were normal. There was spasm of the muscles of the abdomen, back, neck, and face. Frequent episodes of transitory, painful, generalized muscle spasms were observed during the examination.

The red blood cell count, hemoglobin, and white blood cell count, as well as the urine, were normal. The blood test for syphilis was negative.

He received 100,000 units of tetanus antitoxin by vein and 100,000 units intramuscularly. Three thousand cubic centimeters of 5% dextrose in isotonic sodium chloride solution were administered intravenously every 24 hours, and phenobarbital sodium, in doses of 0.13 gm., was given intramuscularly at three-hour intervals for the control of convulsions and severe muscle spasms. The wound of the neck was reopened after the infiltration of the surrounding tissues with 10,000 units of tetanus toxoid, and pus and necrotic tissue were obtained for culture of Cl. tetani. Later, treatment was continued with 30,000 units of crystalline sodium penicillin G intramuscularly, every three hours, and 10,000 units of tetanus antitoxin were given daily for three consecutive days. Anaerobic cultures of the pus and necrotic tissue from the portal of entry were repeated 24, 48, and 72 hours after the initiation of penicillin therapy. The culture on admission was reported as positive; those taken later were negative.

Severe muscle spasms continued unabated despite heavy sedation. On Jan. 4 (15 days after onset and 10 days after hospitalization) the temperature rose to 105 F. within a period of 24 hours. On Jan. 5 the patient was delirious, his breathing was rapid, and examination of his chest revealed multiple coarse rales and rhonchi bilaterally. Since it was evident that he had aspirated large amounts of secretions from the upper respiratory tract, suction was tried, but to no avail. On the same day the patient suddenly developed severe cyanosis, the respirations became stertorous and labored, and he died one-half hour later. Death probably was caused by asphyxia resulting from accumulation of large amounts of secretions in the trachea and bronchi, with persistent laryngeal spasm perhaps playing a part. Permission for autopsy was denied.

The fertile media (pus and necrotic tissue) in which Cl. tetani grew and multiplied in this case guaranteed abundant production of tetanus toxin. From the start it was recognized that a large amount of toxin must have been fixed by the vital centers of the central nervous system, leading to a severe case of cephalic tetanus. Cl. tetani had gained entrance through an incised abscess which was almost completely healed on the patient's admission to the hospital. Since aseptic technique was employed by the surgeon in this minor operation, it can be concluded that infection with the tetanus bacillus occurred later, upon exposure to dirt. It is possible that penicillin, administered for two days after operation might have prevented the disease, since the portal of entry was freed of Cl. tetani within 24 hours after use of penicillin.

The efficiency of penicillin as an antibiotic for Cl. tetani is recognized in this case, but it was useless in the prevention of pulmonary complications. The excessive secretions obstructing the trachea and bronchi, the aspiration penumonia, and the sustained laryngeal spasm would perhaps have been prevented by tracheotomy. Had respiratory paralysis supervened from depression of the respiratory center, as in bulbar poliomyelitis, the use of a respirator or tracheotomy, and suction of the aspirated secretions would have been the procedure of choice.

A case with a rare portal of entry from which Cl. tetani was isolated, and in which penicillin served to eradicate the infection, is hereby presented to illustrate the difficulties of diagnosis and the benefits of early treatment.

diagnosis was not obtained until the picture of tetanus was evident, but it seems that the amount of toxin fixed by the central nervous system was enough to cause only moderately severe symptoms. Rapid recovery ensued in a case that, if not properly treated, would have culminated in death. The effect of penicillin as an antibiotic for Cl. tetani is clear. (We consider crystalline potassium penicillin G more stable than the salt.) The infection was probably limited to the middle ear, not extending to the mastoid cells. It is possible that the free drainage and availability of oxygen in this site may have deferred the growth of Cl. tetani.

Of the six patients in this series in whom pulmonary complications developed, four (60%) died. All the measures used in prevention and treatment of these complications failed to avert a fatal outcome in these cases. The two patients older than 70 (one was 73, the other 82 years old) died, emphasizing the poor prognosis for tetanus among the aged.

The gross mortality rate was 23.5%, in spite of (1) use of penicillin, (2) efficient eradication of the focus of infection of Cl. tetani without débridement, (3) large amounts of tetanus antitoxin, and (4) good sedation, efficient hydration, and adequate electrolytic balance. Failure to maintain the upper respiratory passages unobstructed by tracheotomy and the use of a respirator may account for some of the fatalities. It must be emphasized that the gross mortality rate in this small series is similar to that (20.3%) reported from this same institution [3] under essentially similar conditions, but with emphasis on surgical débridement.

COMMENT

Cl. tetani is a saprophyte and an obligate anaerobe, whose multiplication in vivo is governed, among other factors, by the presence of necrotic tissue, anaerobic conditions, pyogenic organisms, and small amounts of calcium salts that lower the oxidation-reduction potential of tissue.[5] The bacillus is not invasive, and frequently the infection remains localized in a small area. One milligram of purified and crystallized tetanus toxin contains 6,400,000 lethal mouse doses, so that its toxic potency is second only to that of Clostridium botulinum.[6] Fixation of a certain amount of this powerful toxin by the cells of the central nervous system leads invariably to death. (For further description you are referred to Firor and others,[1e] Schumacker and others,[1f] Firor,[1g] and Firor and Jonas [1h]).

It is generally recognized that the local and general symptoms of tetanus are caused by toxemia, at times overwhelming, which occurs when multiplication of Cl. tetani is rapid or prolonged. In those circumstances, there is marked diffusion of toxin and massive fixation by the cells of the central nervous system. The most important therapeutic indications, therefore, seem to be neutralization of free toxin and detention of its production.

Neutralization of free toxin does not eliminate the possibility of further production, however, and treatment with repeated daily injections of antitoxin is not always safe, since the dangers of antitoxin sickness impose limitations on the duration of treatment.

The ideal procedure would be to eradicate the source of toxin. This can be done in some instances by wide excision of the portal of entry, when accessible. Not all portals of entry, however, are easily accessible: for example, those located in the mouth, rectum, or anus. Others, like the middle ear, cannot be excised. Some remain undiscovered. Many would require major surgical intervention, as in endometritis, extensive chronic ulcers or lacerations, large abscesses resulting from intramuscular injections, osteomyelitis, etc. In still other cases, numerous lesions are suspected, but the one responsible for growth of Cl. tetani cannot be localized with ease. In more than 100 cases of tetanus we have found that a little over 50% of the portals of entry are approachable for débridement, and that the procedure per se does not eliminate the infection in every case.

Other measures for preventing multiplication of Cl. tetani should be sought for. The data presented herewith tend to demonstrate that penicillin is a powerful antibiotic against the tetanus bacillus and that eradication of the infection can be attained, in the majority of instances, within 24 hours after initiation of parenteral therapy. They also suggest that its use locally in large doses may be of benefit.

This is substantiated by the disappearance of Cl. tetani from ulcers, lacerations, a draining ear, and an incised abscess within a period of not more than three days after institution of antibiotic treatment without débridement. In only one instance was there evident need for wide excision of the affected tissues, and even in this case favorable results were achieved by local injection of moderately large doses of penicillin in an area almost devoid of blood supply.

Another action of penicillin that may help to retard the growth of the tetanus bacillus is its powerful bacteriostatic effect against gram-positive cocci, responsible for the formation of pus, which favors multiplication of the bacillus.

It appears that administration of penicillin early in the course of the disease can check its progress by eliminating production of toxin, thus preventing further fixation of toxin by the central nervous system. With an antibiotic capable of rapid and efficient bacteriostasis it might be possible to avoid administering antitoxin, aside from that given initially to neutralize free toxin in the body, and perhaps even to avoid débridement. If the presence of pyogenic organisms at the portal of entry of the tetanus bacilli is as important for the latter's action as is generally accepted, then it is even possible that such an antibiotic might be useful in tetanus prophylaxis. Whether or not penicillin can fulfill these demands must await further investigation.

While penicillin is useless in the prevention of the diffusion or fixation of tetanus toxin, it does prevent certain bacterial pulmonary complications and cures others. Together with streptomycin, it aided in the control and cure of aspiration pneumonia in one of our patients. Our experience with this case and others,

lthough limited, is that development of pneumonia durng penicillin therapy in the course of tetanus is an indiation for use of streptomycin, since, in all probability, he infection is due to gram-negative bacteria, amenable o therapy with streptomycin.

Antibiotics will not prevent death from mechanical bstruction of the respiratory passages, respiratory ailure arising from depression of the respiratory center, r asphyxia resulting from prolonged laryngeal spasm. hese complications can be prevented only by mechanial means, such as suction of the tracheal and bronchial ecretions, tracheotomy, and use of the respirator. There evidence to suggest that deaths are preventable by these eans, even when lethal doses of toxin have been fixed y the cells of the central nervous system.[7]

SUMMARY AND CONCLUSIONS

Repeated anaerobic cultures for Clostridium tetani, aken from suspected portals of entry in 17 cases of tetaus, before and after administration of penicillin, yielded e following results: (1) eight positive and nine negative ultures prior to onset of treatment; (2) complete dispearance of Cl. tetani in five within 24 hours, in six ithin 48 hours, and in seven within 72 hours; (3) perstently positive cultures for 29 days in one instance, omplete sterilization being achieved only after local adinistration of penicillin; (4) one instance in which a ulture that was positive 48 hours after initiation of peniillin therapy became negative in 72 hours.

Recent, well-localized, small, shallow, suppurating sions appear to be better sources of Cl. tetani than xtensive, chronic, or deep lesions.

Penicillin seems to be a useful adjuvant in the mangement of tetanus. The beneficial effects can be attributed to its antibiotic property against Cl. tetani, causing its eradication from the portal of entry within one to four days after initiation of parenteral administration.

The elimination of the growth and multiplication of Cl. tetani prevents the production, diffusion, and fixation of tetanus toxin, and indirectly may help in preventing the progress of symptoms.

The bacteriostatic properties of penicillin justify its use in every case of tetanus, both parenterally and locally, when the portal is accessible. Its use may obviate débridement, especially in cases with suppuration or extensive lesions.

Penicillin is useful in the prevention and cure of many secondary bacterial pulmonary infections. Streptomycin is helpful in treatment of pulmonary complications caused by gram-negative bacteria. The danger, prevention, and management of pulmonary complications from mechanical obstruction of the air passages are reemphasized.

Administration of repeated doses of antitoxin after the disappearance of Cl. tetani from the portal of entry is probably a waste of time.

Neutralization of free toxin with tetanus antitoxin; administration of penicillin, even without proper débridement of the portals of entry; proper sedation; efficient hydration and electrolyte balance; proper nutrition, and maintenance of unobstructed air passages by mechanical means, including suction, tracheotomy, and use of a respirator—all these are considered to be lifesaving measures in the management of tetanus.

ACQUIRED TOXOPLASMOSIS

REPORT OF SEVEN CASES WITH STRONGLY POSITIVE SEROLOGIC REACTIONS

J. Chr. Siim, M.D., Copenhagen, Denmark

Since the introduction of reliable, quantitative seroogic methods,[1] cases of congenital toxoplasmosis have een diagnosed with increasing frequency. However, nowledge of the epidemiology and the pathogenesis of he disease is still deficient. It is known that the fetus is nfected in utero because symptoms are manifest at birth nd because mothers of children with congenital toxolasmosis have in all cases shown strongly positive seroogic reactions. Nevertheless, the majority of mothers ave appeared healthy, without any history of definite illness during pregnancy; on postnatal examination, no characteristic clinical signs of disease have yet been demonstrated. Consequently, we must assume the existence of a mild form of acquired toxoplasmic infection, or perhaps even a form not apparent clinically.

Besides such subclinical forms, there have been thus far only few known cases of acquired toxoplasmosis in which significant clinical signs have been present and in which the diagnosis has been verified through the isolation of Toxoplasma in animal-transmission experiments. Sabin[2] describes acute, nonsuppurative encephalitis in two children, one of whom died while the other recovered; and Pinkerton and Henderson[3] report two adult cases of an acute, fatal, systemic infection with fever, maculopapular rash, and atypical pneumonia, which simulated diseases of the typhus-spotted fever group.

Aided by a grant from the King Christian X Foundation.

From the State Serum Institute, J. Ørskov, M.D., Director.

In the preparation of this paper case records from the Blegdamshospitalet, Copenhagen, and from the outpatient department of the Rigshospitalet, University of Copenhagen, as well as information concerning the home treatment of the patients, were used with the permission of Drs. H. C. A. Lassen, Eggert Møller, T. Bennike, and V. Jacobsen.

Since no effective specific treatment is known and since the severe lesions produced by the Toxoplasma are irreparable, the detection of the acquired disease in pregnant women would seem to be a task of primary importance.

The purpose of the present study has been to try to diagnose acquired toxoplasmosis by serologic methods such as the Sabin-Feldman serum dye test and complement fixation tests. With these tests I hoped to be able to recognize generally mild symptoms, which could be suspected as being due to toxoplasmic infection, so that further serologic investigation in similar cases might be undertaken for possible confirmation of suspicions. First, tests were made in a number of patients with fever of unknown origin. As a result, positive seroreactions for toxoplasmosis were demonstrated in a patient with generalized lymphadenopathy accompanied by fever.[4] Then other patients with "adenitis" or suspected mononucleosis were examined, and dye tests and complement fixation tests were positive in the following seven cases, five of which occurred in two familial outbreaks.

REPORT OF CASES

CASE 1.—*Clinical History.*—F. B., a boy aged 6 years, had been in good health previous to Aug. 15, 1950. For four or five days there was a nonirritant affection of the skin, consisting of close-set, pinhead-sized, whitish papules, localized to the forehead, cheeks, and chin. He had felt tired and unwell, and had had signs of a cold, in the form of serous coryza, for about two days when his temperature rose to 39.5 C (103.1 F), on Sept. 2. His general condition was poor, but no headache, nausea, giddiness, or convulsions occurred. He had no pain in the left hypochondrium, no photophobia, and no pains in the joints.

Results of Examination.—In addition to moderate congestion of the fauces unaccompanied by exudate and doubtful rigidity of the neck, the physical examination on Sept. 2 showed a generalized lymphadenitis with numerous painless, firm, discrete lymph nodes, varying in size from a pea to a hazelnut without any periglandular edema. The enlarged glands were in the occipital region on either side of the neck, particularly along the posterior-inferior border of the sternocleidomastoid muscle, in the axillas, and in the groins. Physical examination showed no other signs. Particularly, no changes in the skin or jaundice were observed. No abnormality was found in the respiratory system; there was no enlargement of spleen or liver; no neurological signs were present.

An electrocardiogram was normal. In roentgenologic examination of the skull no intracerebral calcifications were seen. Roentgenologic examination of the chest revealed the right hilus normal and the left hilus enlarged, probably due to adenitis. Ophthalmoscopy showed no signs of chorioretinitis.

Subsequent Course.—On Sept. 3 the temperature ranged from 38.5 to 38.7 C (101.3 to 101.7 F). It remained at about 38 C for the next two days and then returned to normal. On Sept. 6 aphthous stomatitis developed, localized to the palate, the buccal mucous membrane, and the lips. It subsided in the course of five or six days. By Sept. 3 or 4 the patient's general condition had improved; and he was ambulatory on Sept. 8, although still tired, pale, and irritable. He had lost 2 kg. (5 lb.) in weight. A fortnight after the onset of the disease he was completely well and mentally normal. There were no physical signs apart from the generalized adenitis, which remained unchanged as late as six weeks after the onset of the disease. Except for bed rest at home, no treatment had been instituted.

Laboratory Findings: The hemoglobin value was 90% on Sept. 16 and 95% on Oct. 19. The sedimentation rate (Westergren method) was 5 mm. per hour on Sept. 16 and 3 mm. on Oct. 19. The leukocyte count was 7,500 on Sept. 7; it was 9,700 on Sept. 16 and 8,300 on Oct. 19. The differential counts on Sept. 7, Sep 16, and Oct. 19 were as follows: unsegmented, 9%, 6.5%, an 2%, respectively; segmented neutrophils, 14.5%, 16.5%, an 18%; eosinophils, 3%, 9.5% and 8%; basophils, 0.5% on Sep 7, none on Sept. 16 and Oct. 19; large lymphocytes, 16.5%, 18% and 6.5%; small lymphocytes, 50.5%, 45%, and 59%; mon cytes, 5.5%, 4.5%, and 6.5%; plasma cells 0.5% on Sept. 7, no on Sept. 16 and Oct. 19. Many atypical lymphocytes of somewh similar appearance to those seen in mononucleosis were note

The Wassermann reaction was negative. Paul-Bunnell tes made on Sept. 7, Sept. 16, and Oct. 19 were negative. Th antistreptolysin titer on Oct. 19 was normal.

Tests for Toxoplasmosis: On Sept. 20 an occipital lymph no the size of a bean was removed. Half the node was ground in mortar with Tyrode's solution and injected intracerebrally in six mice. All survived for four weeks, and no Toxoplasma cou be isolated after two further passages in mice. The microscop examination of the lymph node showed hyperplasia especial involving the reticular cells in the follicular centers; these ce were large and pale, with large nuclei which stained intensel A great number of typical mitoses but no abnormal nuclei we seen. Among the reticulum cells there were intensely bluis black stained, well-defined granules of varying shape and si occurring partly separately and partly in clusters, which shou presumably be considered nuclear debris resulting from chromatolysis. Occassionally an eosinophilic leukocyte was see Toxoplasma-pseudocysts were not demonstrated, and there we no signs of specific inflammation or malignancy. Sabi Feldman dye test titers on Sept. 7, Sept. 16, and Oct. 19 wa 1:1,600; 1:2,400; and 1:6,250. Complement fixation titers Sept. 16 and Oct. 19 were 1:128 and 1:128.

Environment.—The patient was living in Copenhagen; t family kept no domestic animals; and the flat was not infest with rats or mice. During a vacation on a farm from June to Aug. 6 he had played with a dog and a cat. Except for transi purulent conjunctivitis in the cat, the animals had shown no sig of disease, in particular, no diarrhea. On Nov. 6 an examinati of the cat for Toxoplasmosis showed a dye test titer of 1:1 whereas the reaction in the dog was negative (< 1:10). The died a week later, but there was no opportunity for a furt examination.

An examination of the family on Sept. 16 revealed that patient's father had weak positive reactions. (The dye test 1:50 and was unchanged on Oct. 20. The complement fixati titer was 1:2 and also remained unchanged on Oct. 20.) On other hand, the patient's mother and grandparents had negat reactions, and physical examination showed nothing abnorm in particular, no enlargement of lymph nodes. Serologic tests Toxoplasmosis were strongly positive in a sister (Case 2) and a playmate (Case 3).

CASE 2.—*Clinical History.*—H. B., a girl aged 3 years, been in good health, except for diarrhea and a temperature 38.5 C (101.3 F) of 24 hours' duration on June 27, 1950. Ab Sept. 7, concurrent with her brother's illness (Case 1), she had cold with serous coryza and a slight, dry cough. There was fever; her general health remained quite unaffected; and her petite was good. No headache, eye symptoms, pain in the side, or pains in the joints occurred.

Results of Examination.—In addition to slight reddening the fauces, the physical examination on Sept. 7 showed onl generalized adenitis with numerous painless, firm, discrete lym nodes, that varied in size from a pea to a hazelnut at the an of the jaw, along the sternocleidomastoid muscle, and in axillas and groins. On Sept. 30 the generalized adenitis remain unchanged. There were no changes in the skin, no jaundice, abnormality in the respiratory system, no enlargement of sple or liver, no neurological signs.

An electrocardiogram was normal. Roentgenologic exami tion of the skull showed no intracerebral calcifications. Roe genologic examination of the chest revealed nothing abnorm Ophthalmoscopy disclosed nothing abnormal. There were signs of chorioretinitis.

Laboratory Findings: The hemoglobin value was 73% Sept. 16 and 69% on Oct. 19. The sedimentation rate was mm. per hour on Sept. 16 and 11 mm. on Oct. 19 (Westergr method). The leukocyte count was 9,300 on Sept. 7, 9,000

---

[4] Siim, J. Chr.: Epidemiological Aspects of Toxoplasmosis, read before the 6th International Congress of Pediatrics, Zürich, Switzerland, July, 1950.

Sept. 16, and 9,500 on Oct. 19. The differential counts on Sept. 7, Sept. 16, and Oct. 19 were as follows: unsegmented neutrophils, 8.5%, 9%, and 4.5%, respectively; segmented neutrophils, 34%, 28.5%, and 45%; eosinophils, 2%, 3%, and 2%; arge lymphocytes, 7.5%, 7%, and 4.5%; small lymphocytes, 12.5%, 50%, and 42.5%; monocytes, 5.5%, 2.5%, and 1.5%. The Wassermann reaction was negative. Paul-Bunnell tests on Sept. 7 and Oct. 19 were negative. The antistreptolysin titer on Oct. 19 was 1:250.

Tests for Toxoplasmosis: Dye test titers on Sept. 7, Sept. 20, nd Oct. 19 were 1:800, 1:2,000 and 1:6,250, respectively. Complement fixation titers on Sept. 7, Sept. 16, and Oct. 19 were :128, 1:128 and 1:128.

CASE 3.—J. M., a boy aged 15, had spent his summer vacaion from June 24 to Aug. 6, 1950, with patients F. B. and H. B. Cases 1 and 2). He had Little's disease but was otherwise in ood health. He had displayed no symptoms of any kind. Physial examination on Sept. 7 showed a generalized adenitis with ainless, firm, discrete nodes the size of hazelnuts in the neck, xillas, and groins. There were no other abnormalities except the igns of Little's disease.

Laboratory Findings: The hemoglobin value was 94% on ept. 20. The sedimentation rate was 9 mm. per hour (Westerren method). The leukocyte count was 7,500. The differential ount was unsegmented leukocytes, 11.5%; segmented leukoytes, 25.5%; eosinophils, 3.5%; large lymphocytes, 7.5%; small ymphocytes, 47.5%; monocytes, 4.5%. There were a number of ightly atypical lymphocytes with increased basophilia of the ytoplasm. The Wassermann reaction was negative. The antireptolysin titer was normal on Oct. 28. Paul-Bunnell tests on ept. 20 and Oct. 28 were negative.

Tests for Toxoplasmosis: Dye test titers on Sept. 20 and Oct. 8 were 1:1,250 and 1:6,250. Complement fixation titers on ept. 20 and Oct. 28 were 1:128 and 1:64.

CASE 4.—*Clinical History*.—R. P., a girl aged 8 years, had een in good health previously to the disease for which she was dmitted to the hospital. Since the beginning of October, 1950, he patient had complained of great fatigue and had had a ight, dry cough and serous coryza. On Oct. 6 she had thin, mucous diarrhea without any admixture of blood, but with s many as 10 stools in the 24 hours. The temperature, which as not taken until Oct. 12, fluctuated between 37.5 and 40.2 (99.5 and 104.4 F) for the next fortnight. There had been o headache, disturbances of vision, neurological signs, articular ffections, or urinary symptoms. The patient was first seen by physician on Oct. 20, and was then sent to the hospital.

Results of Examination.—The patient was pale and undernourished. The temperature was 38.3 C (100.9 F). There was o exanthema or jaundice. The fauces were slightly reddened, ut there was no exudate. Ophthalmoscopy showed nothing abnormal. There were no signs of chorioretinitis. In auscultation of the lungs, a few dry rales, which disappeared when the patient coughed, could be heard inferiorly on both posterior suraces. There was slight diffuse tenderness in the abdomen but no enlargement of liver or spleen. There was doubtful rigidity of he back, but not of the neck. Reflexes were normal. In the neck, in both axillas, and in the groins a number of painless, discrete, firm lymph nodes a little larger than hazelnuts could be felt.

Roentgenologic examination of the chest on Oct. 23 revealed rregular infiltration and slight pleural density at the base of the right lung. The right hilus was considerably enlarged. In the left hilus there was a small calcification. On Oct. 31 only a slight pleural density remained. Roentgenologic examination of the skull showed no intracerebral calcifications.

Laboratory Findings: The hemoglobin value was 98% on Oct. 25 and 100% on Nov. 11. The erythrocyte count on Nov. 11 was 4,730,000 and the color index was 0.99. The sedimentation rate was 12 mm. per hour Oct. 28 and 3 mm. per hour Nov. 15 (Westergren method). Leukocyte counts were 16,200 on Oct. 23; 5,600 on Nov. 11; and 9,400 on Nov. 18. Differential counts on Oct 23, Nov. 11, and Nov. 18 were as follows: unsegmented, 23%, 20%, and 8%, respectively; neutrophil leukocytes, 32%, 18%, and 28%; eosinophils, 6%, 5%, and 11%; large lymphocytes, 20%, 12%, and 15%; small lymphocytes, 16%, 38%, and 35%; monocytes, 3%, 7%, and 3%. On Oct. 23 the large lymphocytes were atypical, closely resembling those seen in mononucleosis.

The spinal fluid was clear, the protein content was normal, and there were 3 leukocytes per cubic millimeter; and no erythrocytes. There was no albumin in the urine. The Wassermann reaction was negative. Paul-Bunnell tests on Nov. 15 and Jan. 30 were negative. The antistreptolysin titer was normal on Nov. 15. Cold agglutinin tests on Oct. 28 and Nov. 6 were negative. Agglutination-lysis test for leptospirosis and Widal's reaction were negative. There were faint reactions with Salmonella Senftenberg-Simsbury H-antigen, 1:10, and with Bacillus dysenteriae Flexner type 1a, 1:25 (50); but no diagnostic importance can be attributed to these reactions. Examination of stools showed no pathogenic intestinal bacteria. Moro's and Mantoux's tests were negative.

Tests for Toxoplasmosis: Dye test titers on Oct. 28, Nov. 15, and Jan. 30 were 1:5,000; 1:6,250; and 1:2,500, respectively. Complement-fixation titers on Oct. 28, Nov. 14, and Jan. 30 were 1:128, 1:128, and 1:64, respectively.

Course.—The temperature remained elevated for three days, with a maximum reading of 39 C (102.2 F), and then returned to normal. The cough abated in eight days, and the stools became normal. The patient became ambulatory on Nov. 2 and was discharged on Nov. 21 for a stay in the country. On discharge she complained of great fatigue.

At follow-up examination on Jan. 30 it was learned that the patient had been attending school for about one month and felt less fatigued. The polyadenitis persisted, but the lymph nodes were now only a little larger than peas.

Environment.—The patient was living in Copenhagen. The family kept no domestic animals, and the flat was not infested with mice or rats. She had spent her summer vacation on a farm in the month of July and could not recall any insect stings.

Examination of her parents and of a 4-year-old brother and a 7-year-old sister showed nothing abnormal. There was no enlargement of lymph nodes, and the serologic tests for toxoplasmosis were negative. However, in a 6-year-old brother (Case 5) the reactions were strongly positive.

CASE 5.—*Clinical History*.—J. P., a boy aged 6 years, brother of patient R. P. (Case 4) had had no fever, catarrh, headache, disturbances of vision, exanthema, diarrhea, stitch in the left side, or pains in the joints during the previous year. His general health had been good. No insects' stings had been noticed.

Results of Examination.—In addition to serous coryza, the physical examination on Nov. 16, 1950, showed glands the size of hazelnuts at the angle of the jaw and smooth, painless lymph nodes a little larger than peas in the axillas and groins. (At follow-up examination on Jan. 30 the lymph nodes were reduced to pea-size.) Roentgenologic examination of the skull revealed no intracranial calcifications. Roentgenologic examination of the chest showed nothing abnormal. Ophthalmoscopy disclosed no signs of chorioretinitis.

There were no changes in the skin or jaundice, no enlargement of liver or spleen, and no neurological signs.

Laboratory Findings: The sedimentation rate was 3 mm. per hour (Westergren method). The leukocyte count was 11,900. The differential count was unsegmented, 3%; segmented, 48%; eosinophils, 4%; large lymphocytes, 14%; small lymphocytes, 24%; monocytes, 4%. The urine contained no albumin. The Wassermann reaction was negative. Paul-Bunnell tests on Nov. 18 and Jan. 30 were negative. Moro's test was negative, and the antistreptolysin titer was normal.

Tests for Toxoplasmosis: Dye test titers on Nov. 14 and Jan. 30 were 1:2,500 and 1:1,250, respectively. Complement-fixation titers on Nov. 14 and Jan. 30 were 1:128 and 1:128.

CASE 6.—*Clinical History*.—T. H., a boy aged 9 years, had been in good health previous to early October, 1950, when he began to complain of increasing fatigue. He would not play as usual, lost his appetite, and had a stitch below the left costal margin. On Oct. 25 his mother noticed a marked enlargement of the nodes on either side of the neck and thought that he had mumps. She later noticed enlarged nodes in the groins also. The temperature, which was not taken until Nov. 4, was elevated during the next fortnight, fluctuating between 37.3 and 39.6 C (99.1 and 103.3 F). The patient lost weight, but there were no rigors, headache, giddiness, nausea, disturbances of vision, catarrh, diarrhea, or pains in the joints. On admission to the hospital Nov. 18 he complained of fatigue and slight pain on swallowing.

Results of Examination.—The patient was tired, pale, and undernourished. The temperature was 37.9 C (100.2 F). The left submandibular gland was the size of a pea, and there were painless, discrete, firm, pea-sized lymph nodes in the neck (particularly on the left side), in both axillas, and in the groins. There were no changes in the skin or jaundice; no reddening of the fauces; no enlargement of liver or spleen; no neurological signs. As the temperature was normal the day after admission the patient was discharged. During the next month he still complained of fatigue; but his appetite was good, and he attended school. At follow-up examination on Jan. 4 the lymph nodes were still pea-sized.

Roentgenologic examination of the skull showed no intracerebral calcifications. Roentgen examination of the chest on Nov. 20 revealed slightly enlarged hilus shadows. It was also thought that the contours of enlarged lymph nodes could be distinguished. On Feb. 6 the chest was normal. Ophthalmoscopy showed no signs of chorioretinitis.

Laboratory Findings: The hemoglobin value was 90%. The erythrocyte count was 5,490,000. The color index was 0.78. The sedimentation rates on Nov. 20 and Feb. 6 were 102 and 6 mm. per hour (Westergren method). The leukocyte count on Nov. 20 was 4,800. The differential count was unsegmented, 7%; segmented, 53%; large lymphocytes, 9%; small lymphocytes, 30%; monocytes, 1%.

The urine contained no albumin. The Wassermann reaction was negative. Paul-Bunnell tests on Nov. 23 and 30 were negative, and Widal's reaction was negative. The antistreptolysin titers on Nov. 20, Nov. 30, and Jan. 4 were 1:700, 1:360 and 1:90. Moro's test was negative.

Tests for Toxoplasmosis: Dye-test titers on Nov. 21, Nov. 30, and Jan. 4 were 1:6,250; 1:6,250; and 1:1,250. Complement fixation titers on Nov. 30 and Jan. 4 were both 1:64.

Environment.—The patient was living in Copenhagen, and the flat was not infested with mice or rats. The family kept a cat, which had not displayed any signs of disease. Tests for toxoplasmosis in the cat on Nov. 30 were negative.

The patient had been away on vacation from July 2 to Aug. 12 and during that time had been in contact with animals, including a cat and a dog. He stated that he had been stung by gnats there.

Physical examination of his mother and three sisters and brothers (8, 7, and 4 years old) showed nothing abnormal. There was no enlargement of lymph nodes, and the serologic reactions were negative.

CASE 7.—*Clinical History.*—G. H., an unmarried woman aged 20 years, previously in good health, noticed enlarged, painless nodes in her right armpit in mid-October, 1950. She did not seek medical advice until the end of November. Her physician found an enlarged gland the size of a hazelnut at the angle of the jaw on the left side and well-defined, painless lymph nodes a little larger than hazelnuts in the right axilla. A fortnight later there were enlarged nodes in the left axilla also. Except for marked fatigue and nausea, the patient had no complaints. There had been no headache, giddiness, disturbances of vision, rigors, tonsillitis, catarrh, pains in the joints, gastrointestinal or urinary symptoms, or loss of weight. Menstruation was regular, the last onset having been on Dec. 11, when expected.

Results of Examination.—On Dec. 20 physical examination showed a painless, well-defined gland the size of a hazelnut at the angle of the jaw on the left side and similar isolated glands in the axillas; there was no adenitis in the neck or groins. There were no other abnormalities, particularly no changes in the skin or jaundice. The breasts were normal. The respiratory system showed nothing abnormal. There was no enlargement of liver or spleen, and there were no neurological signs.

Ophthalmoscopy, an electrocardiogram and roentgenologic examination of the chest and skull revealed nothing abnormal. A nonpathological calcification was found in the pineal body.

When examined again on Jan. 15 the patient was still tired. She had not had to remain in bed, but had worked at the office, only periodically and with difficulty. There was enlargement of the submandibular nodes on either side and of the submental nodes. A lymph node the size of a hazelnut could now also b demonstrated in each groin. Apart from iron therapy she ha been given no treatment.

Laboratory Findings: On Dec. 18, Jan. 15, and Jan. 29 th hemoglobin values were 84%, 82% and 83%, respectively. Th erythrocyte counts on Dec. 20 and Jan. 29 were 3,540,000 a 3,830,000. The color indexes were 1.05 and 1.07. There wa 237,000 platelets on Dec. 20 and 178,000 on Jan. 29. The sed mentation rate (Westergren method) was 9 mm. per hour o Dec. 18 and 4 mm. on Jan. 15. The leukocyte counts on D 11, Dec. 20, Jan. 15, and Jan. 29 were 3,960; 6,240; 5,040; a 5,720, respectively. The differential counts on these dates we as follows: neutrophil leukocytes, 55%, 67%, 72%, and 70 eosinophils, 1%, 0%, 0%, and 3.33%; lymphocytes, 42%, 29 26.33%, and 26%; monocytes, 2%, 4%, 1.66%, and 0.66

The urine contained no albumin. The Wassermann reacti was negative. Paul-Bunnell reactions on Dec. 18 and Jan. were negative. The antistreptolysin titer on Dec. 20 was norm

Tests for Toxoplasmosis: Dye test titers were 1:1,250 Dec. 11; 1:1,250 on Dec. 20; 1:6,250 on Jan. 15; and 1:1,2 on Jan. 29. Complement-fixation titers were 1:32 on Dec. 1:64 on Dec. 20; 1:128 on Jan. 15 and 29.

Environment.—Examination of the patient's mother show negative reactions for toxoplasmosis; there were no other me bers of the family. There were no domestic animals in the hou and rats or mice had not been observed. There were, howev numerous gnats. She had no contact with animals where s worked. During a vacation in the country the last two wee of July she had had no contact with animals and had not notic insects' stings.

COMMENT

The principal clinical finding in seven patients wi strongly positive serologic reactions for toxoplasmo was generalized lymphadenopathy, which had not be noticed by patient. The enlarged, painless lymph nod were firm and discrete and were found in the neck, groi axillas, and in two cases in the suboccipital region a the hilus of the lungs as well. One patient complained a pain in the left hypochrondrium, but there was no e largement of the spleen.

In three patients, the adenitis was the sole finding a was only revealed on examination Of the other patien one complained of marked lassitude with no obvio cause; the remaining three cases showed some elevati of temperature and nonspecific catarrhal symptoms. one patient this was accompanied by infiltration of t right lung and persistent mucous diarrhea. It cannot decided at present whether these more acute sympto are manifestations of the disease itself or are due to secondary infection. One patient had a positive antistre tolysin reaction and an elevated sedimentation ra whereas in the others both the sedimentation rates a the total leukocyte counts were normal. Two patie showed eosinophilia and relative lymphocytosis, and three patients the lymphocyte count was at the upp limit of normal. The lymphocytes were atypical, with increased basophilia of the cytoplasm.

In considering the differential diagnosis, it is importa that there was no exanthema and that the Wasserma and Paul-Bunnell reactions were negative. It is co sidered not improbable that in some diseases diagnos clinically as infectious mononucleosis, in which the Pau Bunnell reaction is found to be negative, tests woul show a positive serologic reaction for toxoplasmosis.

Although in congenital toxoplasmosis lesions in th eyes and central nervous system dominate the clinica picture, no abnormality of these organs was found. Th enlargement of the lymph nodes persisted for severa months, and in three cases the convalescence was accompanied by pronounced tiredness. All patients, however, made a complete recovery.

Unexplained fever or marked lassitude in pregnancy would seem, therefore, to indicate a thorough search for enlargement of lymph nodes. It should be noted, however, that experience with natural and experimental toxoplasmic infections in animals shows that there is good reason to expect that the acquired disease may occur in more than one form and may not even become manifest clinically.

An attempt was made to demonstrate Toxoplasma in a lymph node removed at biopsy. Microscopic examination nd animal inoculation gave negative results. Although ositive findings by these methods are needed to make e final diagnosis, it is felt that the results of the serologic sts make the diagnosis probable. The titers found in ese cases were of a level hitherto found only in conrmed congenital toxoplasmosis. Moreover, it was posible to demonstrate that the progression of the disease as accompanied by rising titers which fell during conalescence. The association of lymphadenopathy and ositive serologic reaction in the same clinical picture ems justified by the fact that in the familial outbreaks e remaining members of the family with no lymph node nlargement showed negative serologic reactions.

The epidemiology of toxoplasmosis is not clear. Reently, with Christiansen,[5] I have shown that the protozoa isolated from wild hares dying from toxoplasmosis are serologically and in pathogenicity apparently identical with the human Toxoplasma strain R. H. In Copenhagen a surprisingly large number of dogs have been found to have positive serologic reactions.[4] Since the viscera of hares and the urine of experimentally infected dogs are found to contain Toxoplasma, the possibility of transmission from these sources should be taken into account. The natural route of infection is unknown, but the possibility of infection via the alimentary or upper respiratory tracts, as well as via the bites of blood-sucking insects, should be considered.

SUMMARY

Seven cases of enlargement of the lymph nodes with positive serologic reactions for toxoplasmosis are described. Six cases were in children and one in an adult. Five cases occurred in two familial outbreaks. No signs of involvement of the eyes or of the central nervous system were found, and all the patients recovered completely. Evidence for regarding these as cases of acquired toxoplasmosis and the epidemiology of toxoplasmosis are discussed.

SOME USEFUL NEUROLOGICAL TESTS

Robert Wartenberg, M.D., San Francisco

The following simple clinical tests, easy to perform nd to interpret, and requiring but little time, deserve vider use. For everyday neurological examination in the ffice, they have proved highly valuable. Single eponyms, requently used in neurological textbooks often are not nd cannot be historically correct. They are meaningless o the student and tax his memory without commensurate enefit. For this reason, no eponyms will designate any of hese tests. They will be given physiological names.

LID VIBRATION TEST

Many years of experience have proved the following test to be the most dependable and sensitive for the detection of a facial palsy, central or peripheral. Here the palpable vibration of the orbicularis oculi on contraction is tested. The patient closes his eyes, and with his thumb the examiner lifts the upper lid against resistance. In a normal person the examiner feels the vibration of the upper lid which is rapidly successive, vigorous, and extensive. This is because every voluntary contraction of the muscle is practically a tetanus. In facial paralysis, both central and particularly peripheral, this palpable vibration is diminished; it is less vigorous, less frequent, and less extensive. This diminished palpable vibration of the upper lid presages an imminent facial paralysis long before other clinical signs become evident, and for years may remain the only residual after complete clinical recovery from facial palsy.

WINKING-JAW TEST

When this test is positive, the mandible moves to one side as the cornea on the other side is touched. This is a movement of the external pterygoid muscle, associated with a contraction of the orbicularis oculi muscle which is incident to the touching of the cornea. Using a glass applicator, the examiner touches one cornea with some force. A strong reflex closing of the patient's eye should be achieved. Simultaneously with the closure of the eye, the mandible moves quickly to the opposite side. The same movement may occur when the patient actively closes one eye briskly and forcefully. This associated movement of the mandible indicates a lesion of the corticotrigeminal pathways on the side of the touched cornea. It does not occur in the normal subject. The value of such a positive test lies in the fact that there is no, or no better, indication of a supranuclear lesion of the trigeminal nerve.

HEAD RETRACTION REFLEX

This is a reflex of the muscles which retract the head, i. e., which bend it backward. It is elicited as follows: The patient is made to relax, with his head bent slightly forward and the examiner taps the middle of the upper lip with the reflex hammer in such a way as to bring about

---

From the Division of Neurology, University of California School of Medicine.

a further flexion of the head, with further stretching of the retractors. If this reflex is positive, the patient responds to the hammer-blow by brisk, short retraction of his head. This occurs in bilateral lesions of the pyramidal tract above the cervical cord. It has been seen in diffuse brain lesions such as cerebral arteriosclerosis, hypertensive encephalopathy, cerebral syphilis, and in advanced cases of amyotrophic lateral sclerosis, lateral sclerosis, and dorsolateral sclerosis. In the normal subject, the reflex is negative; only slight oscillation of the head occurs, and there is no retraction.

HEAD BENDING TEST

The examiner bends the head of the sitting patient forcibly forward. Physiologically this means considerable elongation of the spinal cord, the meninges, and roots. This is the basis of the famous Brudzinski neck sign. If this elongation is carried out on the lower end of the cerebrospinal axis by raising the outstretched leg of the patient, it forms the physiological basis of the signs of Lasègue and of Kernig. In the normal subject the mobility of the spinal cord, meninges, and roots is such that the patient has no discomfort on head bending. If there is any affection of the meninges, or of the roots, on head bending the patient has pain or paresthesias exactly in the affected area. This is most dramatically seen in compression or stretching of a root by a tumor or intervertebral disc, but is seen also in diffuse affections of the roots, i. e., polyradiculoneuritis. Patients describe the sensation as "electric shock" or "tingling." This reaction of the patient constitutes a valuable diagnostic aid. In the so-called Guillain-Barré syndrome these painful sensations are mostly localized in the legs and in the heels, sometimes even in the fingers. In multiple sclerosis and dorsolateral sclerosis the sensations are felt in the upper back. In multiple sclerosis this may be one of the earlier signs. Even if the test is negative, i. e., when the patient does not complain when his head is passively bent, the sign has significant diagnostic value, since it means that the spinal meninges and roots are free, or at least not grossly encroached upon. The general usefulness of this simple test is incontestable.

ARM DEVIATION TEST

The patient, with arms outstretched horizontally before him, stands in front of the examiner. The examiner stretches out his arms and supports the fingertips of the patient with his own fingertips. The patient closes his eyes. The examiner removes his support allowing his arms to remain in the horizontal position. He ascertains whether one or both of the patient's arms deviate, and in which direction. He measures the degree of deviation from the position of his own arms.

In the normal subject the arm deviates not at all, or very slightly outward and upward. In pyramidal lesions the arm deviates downward. In cerebellar lesions the arm deviates strongly outward and upward. It may deviate outward and downward, but it is the deviation outward which must be regarded as typical. In extrapyramidal lesions (as in paralysis agitans, or Parkinson's disease) the arm deviates downward and inward. In parietal lobe lesions the arm deviates slightly downward while the fingers perform spontaneous, involuntary athetoid movements.

HEAD DROPPING TEST

This test is valuable for the diagnosis of early paralysis agitans. Rigidity, typical for this disease, usually starts in the muscles of the neck. The test serves to detect such rigidity, even of the slightest degree. The patient lies supine on a padded surface without a pillow. The examiner slips his left hand under the patient's head while it rests on the table. With his right hand, he lifts the patient's head suddenly, briskly, unexpectedly, and allows it to drop so that it falls back on his left palm.

In the normal subject when the patient is fully relaxed, the head drops heavily like dead weight. In paralysis agitans the head drops slowly, gently, hesitantly, due to the rigidity of the neck muscles. In far-advanced cases, when asked to lie supine on the table, the paralysis agitans patient keeps his head elevated so that his occiput never comes in contact with the surface, and this position is maintained indefinitely—"frozen head dropping test." The test is so sensitive that it can be said when the head dropping test is normal, paralysis agitans of any variety can be excluded.

SHOULDER SHAKING TEST

Extrapyramidal rigidity documents itself very early in the diminution of pendulousness of the arms in walking. When this diminution is unilateral it becomes a valuable sign of incipient paralysis agitans. This diminution is plainly seen when the patient walks, but can be demonstrated even with greater clarity by the following test. The examiner stands facing the patient and places his hands on the patient's shoulders. He shakes the shoulders in a brisk and alternating rotatory movement, to and fro, and with varying speed and force. This produces arm swinging the intensity of which can be controlled by the examiner. In paralysis agitans the muscle rigidity reduces the excursion of the swinging arm, either bilaterally or unilaterally. The difference between the two sides may be striking. Even if slight, the difference in the range of movement can, to some degree, be appraised quantitatively.

This test is valuable in another way. Not only extrapyramidal rigidity produces diminished pendulousness of an arm in walking, but a homolateral cerebellar affection may do the same. In this case, though there is no hypertonia as in extrapyramidal disease, but cerebellar hypotonia instead, still the affected arm swings less. The pathophysiology is not the same in the two conditions. Extrapyramidal affections diminish pendulousness through rigidity of the affected muscles. Cerebellar affections produce diminution of pendulousness through "decompensation of movement." Here the arm, though hypotonic, does not move synchronously with the contralateral leg in walking, due to cerebellar dyssynergia, i. e., the lack of synergic movements of different parts of the body. If a patient shows diminution of the pendulousness of one arm in walking, the question arises as to whether this is extrapyramidal or cerebellar in origin. The shoulder shaking test will decide the issue. If, on shoulder shaking, the affected arm moves less, the affection is extrapyramidal; if it moves more, cerebellar.

PUSH TEST

The patient stands with his feet apart, bearing his veight evenly on both legs. The examiner, his hand on he patient's sternum, pushes him gently backward. The ormal person, to prevent falling backward, innervates he dorsiflexors of his feet and toes and lifts the toes lightly from the floor, shifting his weight to his heels. atients with paralysis agitans do not do this. The whole oot remains flat on the floor. This is particularly striking n unilateral paralysis agitans. When the patient is pushed ackward, on the healthy side there is a normal visible ontraction of the dorsiflexors of the toes and foot and light lifting of the toes. The affected side remains static.

PENDULOUSNESS OF THE LEGS TEST

This simple and reliable test serves quickly to appraise he muscle tonus of the lower extremities. The patient sits n the examining table, his legs hanging freely over the dge. He is made to relax. The examiner lifts the patient's egs and allows them to drop, observing the length of ime and the manner in which they swing. This test gives aluable information in diseases of the pyramidal, cereellar, and peripheral nervous systems. But the test is ost helpful in the diagnosis of extrapyramidal rigidity, s in paralysis agitans. This rigidity very markedly hortens the swinging time. In unilateral paralysis agitans he difference in the swinging time between the affected nd the healthy side is obvious.

ASSOCIATED MOVEMENTS TEST

A pyramidal lesion is characterized by the tendency of he patient to perform mass movements instead of single, ine movements. Such a test is valuable for differential iagnosis between spastic and flaccid paralysis of the xtremities. Two examples may be cited. In spastic paralsis of the dorsiflexors of the hand and fingers, the patient s unable to dorsiflex his wrist on command. But when e is asked to grasp an object with his affected hand, he imultaneously dorsiflexes his wrist in the form of an ssociated movement. In peripheral paralysis of these uscles, as in paralysis of the radial nerve, the patient oes not perform this dorsiflexion of his wrist in grasping. On the contrary, in squeezing the object with his fingers, he volarflexes his hand still more. In spastic paralysis of the dorsiflexors of the foot, the patient, unable to dorsiflex his foot on command, performs this very movement automatically when the flexor withdrawal reflex (homolateral mass flexion reflex) is elicited, i. e., when his toes are forcibly flexed plantarward. In peripheral palsy of the dorsiflexors of the foot, this passive flexion of the toes has no effect on the dorsiflexors of the foot.

ASSOCIATED MOVEMENT OF THUMB

The basis of this sign is the general tendency of a patient with a pyramidal lesion to perform mass movements instead of single, fine movements. With his left hand, the examiner tightly grasps the patient's wrist on the affected side. With his other hand the examiner hooks his four fingers into the four bent fingers of the patient. The patient is asked to bend his four fingers further against those of the examiner, and to exert all his strength in a pulling motion. If there is the slightest spastic paralysis of the hand, the patient's thumb is adducted, flexed, and is moved in toward his palm. This is a very early pyramidal sign. In the normal subject, the thumb remains immobile, or its end phalanx bends slightly. It is particularly the marked difference in the behavior of the thumb on the two sides that renders this test valuable.

DISSOCIATION BETWEEN ABDOMINAL SKIN AND ABDOMINAL MUSCLE REFLEXES

Every neurological textbook speaks of "abdominal reflexes." These reflexes are so important and diagnostically popular that the term "abdominal" is often used alone when referring to the reflexes. However, the term "abdominal reflexes" is incorrect and misleading. A strict distinction must be made between the abdominal skin and the abdominal muscle reflexes. The first is a superficial, a "skin" reflex. Without being touched, the muscle contracts on stimulation of the skin. The second is a deep or muscle stretch reflex. Here the muscle contracts when stretched. The abdominal muscles have both types of reflex, and these types must be strictly differentiated. It is highly confusing to use the term "abdominal reflexes" and by it to designate only the superficial (skin) reflexes. In a pyramidal lesion, for instance, the behavior of each type of reflex is quite different: If the lesion is bilateral and affects the pyramidal tracts above the sixth thoracic segments, we have dissociation of abdominal skin and abdominal muscle reflexes—the abdominal skin reflexes are lost, and the abdominal muscle reflexes exaggerated. There is no more reliable sign of a bilateral pyramidal lesion above the sixth thoracic segment than this dissociation. It is even superior to the Babinski reflex.

MEDIAN NERVE TEST

To determine a defect in the function of the median nerve, we usually examine for the opposition of the thumb. However, it is better to examine for the abduction of the thumb which is a pure median function, and is more easily appraised quantitatively. With the patient's fingers extended, palmar surfaces facing each other, the finger tips make contact so as to form a sort of steep roof. The thumbs are then abducted, their inner surfaces kept at right angles to the palms, their tips kept in apposition. A triangle is formed, with the thumbs as the base, and the index fingers as the sides. In a median palsy the thumb on the affected side cannot be abducted as far downward as the one on the normal side. The base of the triangle, therefore, is broken, the thumb on the affected side being higher than that on the normal. The more severe the median nerve palsy, the higher the tip of the affected thumb stops above that of the healthy thumb. As recovery proceeds, the patient is able to abduct the affected thumb more and more, until its tip approximates that of the normal thumb. This is not only a quantitative, but a qualitative test as well.

TENDON PALPATION TEST

A tendon is palpated with the thumb to estimate its resistance to pressure. In affections of the cerebellum and peripheral nervous system the tendon is soft and offers less resistance; it is more easily compressed than in the normal subject. This is particularly true of the Achilles tendon. The patient stands on the examining table with his back to the examiner. Care should be taken that his weight is distributed evenly on both feet. The examiner grasps the patient's ankles, his thumb touching the Achilles tendon. The tendon is compressed on both sides simultaneously, and the resistance judged. In sciatic neuritis of any origin the Achilles tendon is softer and offers less resistance than the normal tendon. In the manifold affections of the sciatic nerve or its roots, for instance in the presence of a protruded intervertebral disk or in infectious sciatic neuritis, the softness of the Achilles tendon is striking. The softness of this tendon may be of decisive importance for differential diagnosis between a neurogenic and a non-neurogenic affection.

BRACHIAL PLEXUS BLOCK ANESTHESIA IN CHILDREN

George A. Small, M.D., Brookline, Mass.

Since 1897 there have been many works published on anesthesia of the upper extremity by injection of the brachial plexus. The general consensus is in accord with Labat's observation that "the brachial plexus block is the method of choice for all major operations on the upper extremity."[1] However, the commendation accorded this method of anesthesia has not elevated it to the position that it merits in the armamentarium of the pediatric anesthesiologist. The literature has commonly indicated that children are poor subjects for local anesthesia because of the difficulty in obtaining their cooperation and because they may sustain serious psychic trauma during the procedure.[2] That this is not a universal attitude is manifested by a number of articles which suggest that children are suitable subjects for brachial plexus block.[3]

The following is a report of the program pursued in the management of 151 brachial plexus block anesthesias performed on 150 children.

SPECIAL CONSIDERATIONS

The actual block of the brachial plexus in a child is but a small part of this procedure. Attention to the several psychological, pharmacologic, and anatomic considerations involved are most important to the success of the method. The salient features of these considerations will be discussed.

Every child requiring surgery because of illness or accident suffers not only from physical trauma attendant upon the injury or disease, but also from the severe psychic trauma related to hospitalization and its associated awesome sights, sounds, and smells, dislocation from the family, and disruption of the familar daily routine. Such a child is disturbed by fears, anxieties, and apprehensions. Some children contain their natural fears admirably and may reveal nothing more than a slight elevation of the pulse rate. The majority, however, are too young to exert such praiseworthy emotional control, and exhibit evidence of the stress they suffer, some by an inordinate amount of vigilance and curiosity, many by crying continuously for a parent, a number by whimpering at every approach, and a few by complete negativism. To expect cooperation and rational behavior from children as a requisite to a successful brachial block is a mistake. Many children can cooperate fully; a number of children in this series required no more than a simple explanation of the proposed procedure after which the block was accomplished without opposition. Nevertheless, it is prudent to assume at the outset that every child is going to object actively to all advances, and one must be prepared to manipulate circumstances as the indications arise.

Another important consideration is the selection of the premedication: choice of drugs, dosage, and the route of administration. The aim is quickly but safely to provide a short period of hypnosis and amnesia, without notable respiratory depression. Attainment of this goal 100% of the time is not easily achieved; frequently it is accomplished; more often it is closely approximated with very satisfactory results. In this study morphine, meperidine (demerol®), atropine, scopolamine, and pentobarbital (nembutal®) sodium were administered in several combinations intravenously, intramuscularly, and subcutaneously; thiopental (pentothal®) sodium and pentobarbital sodium were given by rectal instillation. In this series experience with any one drug or combination of drugs has not been extensive enough to justify any positive conclusions or recommendations for a standard routine. However, some general conclusions have been drawn which may be helpful.

Though a child appears to be free of fear and apprehension it is wise to administer a barbiturate, such as pentobarbital sodium, for the specific protective property of the barbiturates against procaine hydrochloride (novocain®) reactions. Furthermore, the apparent stoicism of the child is usually the product of a strenuous voluntary effort, and the psychic sedation provided will

---

The pentobarbital sodium used in the cases reported in this paper was supplied by the Abbott Laboratories, North Chicago, Ill.

ise the inner tension appreciably.[4] When pentobarbital odium is administered alone for mild sedation the dose hould not be large enough to produce sleep, for then ere is a possibility that the patient may become uncontollably restless.

TABLE 1.—*Dosage of Premedicating Drugs, Mg.*

Age	Morphine Hydrochloride	Atropine Sulfate	Scopolamine Hydrobromide	Meperidine Hydrochloride	Pentobarbital Calcium
1-2	1.0	0.10	....	15	15
2-3	1.2	0.12	....	20	20
3-4	1.6	0.12	....	25	25
4-5	2.0	0.16	....	30	30
5-6	2.0	0.16	0.12	35	35
6-7	3.0	0.20	0.16	40	40
7-8	3.0	0.20	0.20	50	50
8-9	4.0	0.32	0.20	50	50
9-10	4.0	0.32	0.32	50	60
10-11	5.0	0.12	0.32	50	60
11-12	6.0	0.42	0.42	50	60

Scopolamine is probably best not used on children ider five because it tends to produce delirium and mania iring the recovery period, a result which can be most fficult for the nurses and alarming to the parents.[5]

Rectal thiopental produces a quiet sleep during which brachial plexus may be readily blocked; however, this ep will last only 30 min. to one hour, and with emernce the child may become unmanageable. When rectal iopental is used for premedication additional medicaon should be available for administration at the first gn that the child is awakening.

The combination of morphine, atropine, and pentorbital sodium or that of meperidine and pentobarbital dium administered intravenously enables one to atin the ideal in premedication of children for brachial exus anesthesia. Meperidine and a 5% solution of ntobarbital sodium form a precipitate if mixed in the me syringe but can be injected through one venipuncre from two syringes by completion of the injection of ie drug, disconnection of the syringe from the needle, id attachment of the second syringe, with care not to splace the needle from the vein. Any overt opposition the procedure on the part of the child is likely to be et at the time of the venipuncture; finesse in its perrmance and the use of sharp needles of finest gage will inimize the patient's objections.

Below is the dosage of the drugs (Table 1) that have oved useful in this study. The figures represent maxium single doses given, except in several instances in hich the children were unusually high strung. Factors hich influence the selection and the dosage of drugs re the age of the child, the size, general condition, and verity of trauma, and the degree of nervous irritability. is advisable to err on the side of insufficient medication itially, for such errors are easily corrected with additional doses, whereas overenthusiastic use of these potent rugs may expose the child to unnecessary danger of entral nervous system depression.

The anatomy of the brachial plexus is another matter or consideration. Because the brachial plexus block in he child is an anatomic procedure, a clear understanding f the relationships of the several structures involved is ecessary to the attainment of a reliable proficiency in the erformance of the block. The many good texts available and the laboratory dissection of the plexus are interesting aids to this understanding.

In the technic employed in this study the fact that it is possible to palpate the first rib below the supraclavicular fossa of a child so that it can be distinguished with certainty from all other structures was utilized to the utmost advantage in almost every case. This palpation is possible even though the child has a chubby layer of adipose tissue; the tissues of children are usually thin in this region and offer little resistance to deep palpation. A second helpful indication is the pulsation of the subclavian artery. Facility in locating these two guides is attained after some experience; the process of anesthetizing the brachial plexus in a child then becomes easier than in an adult.

ANESTHETIC SOLUTION

The anesthetic solution used in this series was prepared as follows: to 42.5 cc. of sterile saline solution was added one 5-cc. ampoule of 20% procaine hydrochloride solution (1.0 gm.), one 2-cc. ampoule of 1% tetracaine (pontocaine®) hydrochloride solution (20 mg.), and 0.5 cc. of 1:1,000 epinephrine (adrenalin®) hydrochloride solution. The resulting solution then consisted of 50 cc. of 2% procaine hydrochloride and 0.04% tetracaine with 1:100,000 epinephrine.

The total amount of solution injected varied with the age and size of the subject, and is given in Table 2.

TECHNIC

A short observation period during which one endeavors to appraise the child, and to develop a friendly relationship is the first step in a brachial plexus anesthesia. The assistance of a nurse to do some mothering is of inestimable value at this time. Surgical equipment, particularly hypodermic needles, are fear-inspiring implements, and are best kept out of sight until time for their use. It is during this period that the premedication is selected and administered.

One hundred and twenty-four blocks were performed by the supraclavicular route, essentially after the method described by Kulenkampff.[6] The remaining 27 blocks were induced by a modification of the axillary approach described by Accardo and Adriani.[3d] The popular supraclavicular method is discussed here; the subaxillary modification of the Accardo and Adriani axillary technic will be described in a future paper.

TABLE 2.—*Total Anesthetic Solution*

Age of Patient, Year	Amount of Solution
1-3	7-12 cc.
4-6	10-15 cc.
7-9	15-20 cc.
10-12	15-25 cc.

In performing the supraclavicular block the head is maintained in the midline and turned about 45 degrees to the opposite side. The shoulder of the side to be blocked should be depressed caudally as much as pos-weight is distributed evenly on both feet. The examiner grasps the patient's ankles, his thumb touching the Achilles tendon. The tendon is compressed on both sides simultaneously, and the resistance judged. In sciatic neuritis of any origin the Achilles tendon is softer and offers less resistance than the normal tendon. In the manifold affections of the sciatic nerve or its roots, for instance in the presence of a protruded intervertebral di or in infectious sciatic neuritis, the softness of the Achill tendon is striking. The softness of this tendon may be decisive importance for differential diagnosis between neurogenic and a non-neurogenic affection.

BRACHIAL PLEXUS BLOCK ANESTHESIA IN CHILDREN

George A. Small, M.D., Brookline, Mass.

Since 1897 there have been many works published on anesthesia of the upper extremity by injection of the brachial plexus. The general consensus is in accord with Labat's observation that "the brachial plexus block is the method of choice for all major operations on the upper extremity." [1] However, the commendation accorded this method of anesthesia has not elevated it to the position that it merits in the armamentarium of the pediatric anesthesiologist. The literature has commonly indicated that children are poor subjects for local anesthesia because of the difficulty in obtaining their cooperation and because they may sustain serious psychic trauma during the procedure.[2] That this is not a universal attitude is manifested by a number of articles which suggest that children are suitable subjects for brachial plexus block.[3]

The following is a report of the program pursued in the management of 151 brachial plexus block anesthesias performed on 150 children.

SPECIAL CONSIDERATIONS

The actual block of the brachial plexus in a child is but a small part of this procedure. Attention to the several psychological, pharmacologic, and anatomic considerations involved are most important to the success of the method. The salient features of these considerations will be discussed.

Every child requiring surgery because of illness or accident suffers not only from physical trauma attendant upon the injury or disease, but also from the severe psychic trauma related to hospitalization and its as ciated awesome sights, sounds, and smells, dislocati from the family, and disruption of the familar daily r tine. Such a child is disturbed by fears, anxieties, a apprehensions. Some children contain their natural fe admirably and may reveal nothing more than a sli elevation of the pulse rate. The majority, however, too young to exert such praiseworthy emotional cont and exhibit evidence of the stress they suffer, some by inordinate amount of vigilance and curiosity, many crying continuously for a parent, a number by whimp ing at every approach, and a few by complete negativis To expect cooperation and rational behavior from c dren as a requisite to a successful brachial block is a m take. Many children can cooperate fully; a number children in this series required no more than a sim explanation of the proposed procedure after which block was accomplished without opposition. Nevert less, it is prudent to assume at the outset that every ch is going to object actively to all advances, and one m be prepared to manipulate circumstances as the indic tions arise.

Another important consideration is the se the premedication: choice of drugs, dos of administration. The aim is qu vide a short period of hypnosis notable respiratory depression. At 100% of the time is not easily achie accomplished; more often it is clos with very satisfactory results. In this s meperidine (demerol®), atropine, scopolam tobarbital (nembutal®) sodium were administ eral combinations intravenously, intramuscular subcutaneously; thiopental (pentothal®) sodium pentobarbital sodium were given by rectal instilla In this series experience with any one drug or combi tion of drugs has not been extensive enough to justi any positive conclusions or recommendations for standard routine. However, some general conclusio have been drawn which may be helpful.

Though a child appears to be free of fear and appr hension it is wise to administer a barbiturate, such pentobarbital sodium, for the specific protective pro erty of the barbiturates against procaine hydrochlori (novocain®) reactions. Furthermore, the apparent sto cism of the child is usually the product of a strenuo voluntary effort, and the psychic sedation provided w

---

The pentobarbital sodium used in the cases reported in this paper was supplied by the Abbott Laboratories, North Chicago, Ill.

tions remained adequate for good oxygenation with supplemental oxygen supplied by a catheter inserted into an oropharyngeal airway, and the surgical procedure went forward without further delay. Both children made uneventful recoveries.

The shortest anesthesia obtained was about 50 min. and the longest noted by personal observation was three hours and 45 min. The average duration was approximately two and one-half hours. In one case the operative procedure required five hours; the brachial plexus block began to wear off at two and one-half hours after the start of the surgery; the block was reenforced with a 10 cc. injection of anesthetic solution and remained completely effective until after the operation was terminated. In all other cases a single block outlasted the necessary surgical procedure.

COMPLICATIONS

Because many of this group were treated as outpatients and a number were discharged a day or two after admission, it has been impossible for the clinician administering the anesthetic to these children to make all the necessary postoperative observations. However, the cooperation of the surgical and nursing staffs has been invaluable in this regard. A compilation of all reports and observations from all sources indicated that complications have been notably few and insignificant.

Reported complications of brachial plexus block include hematoma, pneumothorax, toxic reactions from the anesthetic solution, temporary paralysis of the diaphragm, temporary hoarseness, mediastinal emphysema, permanent neural damage, death from intravascular injection, and unexplained death.[7]

Reactions from the anesthetic solution, hematoma and pneumothorax are the most common of the important complications and may be reduced by the precautions of giving a preoperative barbiturate, using fine-gage needles, and attending carefully to the details of performing the block.

Complications encountered in this study consisted of four small hematomas which were asymptomatic and subsided rapidly; there were three instances of Horner's syndrome which subsided with the anesthesia; in one child a rectal temperature of 102 F. developed, accompanied with a four-hour period of hyperpnea postoperatively. This was thought to be due to some atelectasis from respiratory depression resulting from overzealous premedication; recovery was uneventful; a chest x-ray next day was normal.

An increase in heart rate was observed in each case; this occurred irrespective of the inclusion of atropine or scopolamine in the premedication and was attributed to the epinephrine content of the anesthetic solution.

COMMENT

The brachial plexus block is a very satisfactory anesthesia for surgery of the upper extremity in children. It provides excellent relaxation and complete freedom from pain. At the same time it makes it possible to avoid the use of general anesthesia in circumstances in which general anesthesia is least desirable; e. g., in the outpatient department, after ingestion of food, in the presence of respiratory disease, when traumatic shock is present, and for long operations.[8]

It has been pointed out that blocking the brachial plexus has a beneficial effect on traumatic shock associated with severe injuries to the upper extremity; also, the sympathetic nerve block occurring concomitantly with the sensory and motor anesthesia may have a beneficial effect on the circulation of the damaged member.[8a]

The reader may have gained the impression that the preliminary management and the technic of procuring anesthesia by brachial plexus block is too time-consuming to be practical. Were this true it would constitute a valid objection to the method. However, from the moment the anesthesiologist meets the patient until he instructs the surgeon to proceed no more than 40 min., on the average, need be consumed. This is possibly a few minutes longer than it takes to prepare a child and to administer a general anesthetic to a depth commensurate with the proposed surgery.

SUMMARY

A series of brachial plexus block anesthesias in children between the ages of 15 mo. and 12 yr. is reported.

The importance of preoperative management is emphasized.

Experiences with the use of sedating drugs is evaluated.

A technic of brachial plexus block in children is presented.

The results have been very good in this group and the complications have been negligible.

Medical Information in Lay Press.—We of the pharmaceutic industry are fully as unhappy as are most practicing physicians at premature announcements in unwarrantedly over-enthusiastic terms in the public press of so-called "wonder drugs." A free press is one of our precious institutions, and perhaps one of the prices to be paid therefor is the risk of such reports. Unfortunately, too frequently, medical information is interpreted by writers whose backgrounds in medicine are limited, understandably; limitations of space and of time often operate to their disadvantage in preparing material for publication; but it would seem that oversimplification and nonqualification might be minimized, and that enthusiasm might be temperate and controlled so that the lay reader might get a more accurate, less distorted picture. Health education activities, even to include dissemination of public health and medical information, are worthwhile: an informed public is a sound objective; and everyone is interested in his own personal health problems and desires information related thereto. But it is not sound to attempt to inform a public inadequately prepared therefor, with advanced medical information. "If 'a little knowledge is a dangerous thing' . . . a little less is a little more" is undoubtedly true; but insofar as medicine is concerned, a little more discretion in presentation of information through the daily press and through monthly and weekly periodicals . . . would do much toward creating less unhappiness and less dissatisfaction among larger numbers of lay and professional segments of our population.—J. P. Gray, M.D., Present Status of Antibiotics and The Future in This Field, *Rhode Island Medical Journal*, September, 1951.

CLINICAL NOTES

VITAMIN K_1 EMULSIONS IN BISHYDROXYCOUMARIN EMERGENCIES

RESULTS OF INTRAVENOUS ADMINISTRATION

Theodore B. Van Itallie, M.D., Robert P. Geyer, Ph.D.,
and
Fredrick J. Stare, M.D., Boston

Recently an editorial in THE JOURNAL called attention to the dangers of anticoagulant therapy.[1] Although use of protamine sulfate intravenously has minimized the danger of hemorrhage due to heparinization, there exists no comparable rapid treatment for the hypocoagulable state induced by bishydroxycoumarin (dicumarol®). Accordingly, the severe hemorrhages which have complicated anticoagulant therapy have occurred principally in patients receiving bishydroxycoumarin.

Various forms of vitamin K have been used to reverse bishydroxycoumarin-induced hypoprothrombinemia. The relative ineffectiveness of most of these preparations is indicated by the fact that responses to them (in terms of prothrombin time or per cent of normal activity) are usually reported at 24-hour intervals.

It is acknowledged that it is not necessarily desirable to reverse completely the excessively prolonged prothrombin times which may inadvertently follow use of bishydroxycoumarin. Yet when such hypocoagulability is associated with hemorrhage, there can be no question about the necessity for rapidly reversing the prothrombin time. Moreover, a number of situations can arise which demand a rapid termination of the bishydroxycoumarin effect. One such situation is the appearance of an acute surgical problem in a patient who has been receiving the drug.

The use of a potent, rapidly acting vitamin K preparation for the treatment of bishydroxycoumarin-induced hypoprothrombinemia in the dog has been reported.[2] This preparation is a 5% emulsion of vitamin K_1 for intravenous administration prepared in this laboratory as described previously.[2] In dogs, experimentally produced bishydroxycoumarin hypoprothrombinemia was completely reversed in less than three hours, with marked improvement noted in 30 to 60 minutes, by means of the vitamin K_1 emulsion. Use of the preparation in the treatment of bishydroxycoumarin-induced hypoprothrombinemia in man was followed by considerable improvement in prothrombin activity within 60 to 120 minutes, with a continuing but more gradual return toward normal values thereafter.[3]

The following case reports, including one control case in which a commonly used water-soluble vitamin K preparation was employed, are presented as examples of the value of intravenously administered emulsions of vitamin K_1 in the management of emergencies associated with the use of bishydroxycoumarin.

REPORT OF CASES

CASE 1.—A 73-year-old Negro physician was receiving bishydroxycoumarin for a myocardial infarction. In addition to a long history of coronary insufficiency, he was known to have had a resection of an adenocarcinoma of the sigmoid with an end-to-end anastomosis six years previously. On the fifth hospital day he began to complain of generalized abdominal tenderness and colicky pain most marked in the left midabdominal region. This was followed by intermittent vomiting. A surgical consultant made a diagnosis of partial intestinal obstruction. The patient's prothrombin activity at the time was 12%. In anticipation of the possible need for emergency surgery, the consultant urged that an attempt be made to raise the prothrombin to a safer level as quickly as possible. Accordingly, the patient was given 650 mg. of emulsified vitamin K_1 (10 mg. per kilogram of body weight) intravenously. One hour after administration of the drug, the prothrombin activity was 30%, a far safer level for surgery.

CASE 2.—A 30-year-old white man [4] with thrombophlebitis of the right leg was receiving bishydroxycoumarin. Toward the end of his hospital stay there arose an urgent personal matter necessitating his presence at home as soon as possible. At that time his prothrombin activity was 24%. He was given 950 mg. of emulsified vitamin K_1 intravenously. Two hours later his prothrombin activity was 42%; four hours later it was 54%; seven hours later it was 65%. He was allowed to go home the same day. Forty-eight hours later, when he returned for a follow-up prothrombin determination, his prothrombin activity was found to be 90%.

In contrast to the preceding two cases is the following one, which is representative of a bishydroxycoumarin emergency treated with a commonly used water-soluble vitamin K preparation.

CASE 3.—A 62-year-old woman was under treatment with bishydroxycoumarin following a coronary occlusion. On the 35th hospital day a medium-sized cyst was removed from her right breast. After the procedure there was a great deal of hemorrhagic oozing from the operative wound. It was then discovered that by an oversight she had been receiving bishydroxycoumarin for the preceding four days. Her prothrombin activity proved to be 12%. Seventy-five milligrams of a water-soluble vitamin K preparation was administered intravenously every two hours for the following eight hours. The next morning the prothrombin activity was 18%, and a day later it was 24%. The oozing was finally controlled by pressure dressings, and it stopped spontaneously after 24 hours.

SUMMARY

An emulsion of vitamin K_1 suitable for intravenous administration is found to be extremely effective in bringing about a prompt decrease in the hypocoagulability induced by bishydroxycoumarin. Its use in two representative bishydroxycoumarin emergencies is described, and results are compared with those in a third case, in which a commonly available water-soluble vitamin K preparation was used.

ACNEFORM ERUPTION PRODUCED BY USE OF TETRAETHYLTHIURAMDISULFIDE

Sherwood W. Barefoot, M.D., Greensboro, N. C.

Since it was discovered in 1948 that tetraethylthiuramdisulfide (antabuse®) sensitizes the organism to alcohol,[1] it has come to be used rather extensively in the treatment of alcoholism. During the clinical investigation of tetraethylthiuramdisulfide, the number of cases in which it has been used exceeds 5,000.[2] The explanation for the discomforting symptoms produced after ingestion of alcohol in a person who is taking tetraethylthiuramdisulfide appears to lie in the fact that the blood acetaldehyde level is increased in such persons.[3]

In the published literature two references have been found pertaining to skin eruptions during tetraethylthiuramdisulfide therapy. Gelbman and Epstein,[4] reporting on the treatment of 55 cases, commented that among this series skin rash developed in 3 cases. In each case the rash was easily eliminated by routine antihistaminic therapy—50 mg. of tripelennamine (pyribenzamine®) hydrochloride three times a day—for three or four days without discontinuing the use of tetraethylthiuramdisulfide. Lewis and Bremers [5] reported a patient in whom a fixed drug eruption developed whenever he took alcohol while being treated with tetraethylthiuramdisulfide. It was their opinion that the eruption was elicited by a product of the combination of the two drugs.

This report deals with a patient in whom an acneform eruption repeatedly developed coincident with the ingestion of tetraethylthiuramdisulfide. I feel reasonably certain that the patient did not take any alcohol at any time while taking tetraethylthiuramdisulfide. She was very fearful of the violent symptoms produced by ingestion of alcohol when tetraethylthiuramdisulfide was being taken. Once she had taken a teaspoonful of spirit of ammonia for "nervousness" while taking tetraethylthiuramdisulfide and had experienced such a severe reaction that she had been afraid she might die. Insofar as I can determine, a significant skin reaction to tetraethylthiuramdisulfide alone has not previously been observed. In a personal communication Dr. Richard C. Proctor,[6] who has had a fairly extensive experience with the drug, stated that to his knowledge an acneform eruption produced by use of tetraethylthiuramdisulfide has not previously been noted.

REPORT OF A CASE

A white woman, 41, was first seen on Dec. 30, 1950, with a moderately severe cystic acneform eruption of the face, anterior chest, and back. The face was quite dry, and there were practically no milia or comedones. There was no seborrhea of the scalp. She stated that the eruption had been present for about four months and that she had not experienced acne during adolescence.

The patient was questioned carefully about the use of laxatives, headache remedies, sedatives, and so forth to no avail. It was learned that iodized table salt was used in her home. Large doses of vitamin A were prescribed, and she was given a resorcinol mono-acetate-precipitated sulfur skin-colored cream with a water-washable base. She was told to use plain table salt.

Eight days later the patient telephoned and inquired whether or not the tetraethylthiuramdisulfide which she had been taking might have caused the eruption. When surprise was expressed at this revelation, she stated that she had not thought of it as a "drug" and had forgotten to mention it at the time when she had been questioned about "drugs." She stated that the medication had been prescribed to her by Dr. Richard C. Proctor about four months previously and that the eruption appeared shortly thereafter.

It was learned that on the day following her initial examination on Dec. 30, 1950, she had gone out of town and had neglected to take her tetraethylthiuramdisulfide with her. She stated that within two days after discontinuing use of the drug the eruption had almost completely disappeared.

On Jan. 8, 1951, use of tetraethylthiuramdisulfide was resumed with the usual dosage of 1 gm. daily along with 25 mg. of chlorprophenpyridamine (chlortrimeton®) maleate after meals and at bed time. The acneform eruption recurred within three days and within a week was as bad as ever. After two weeks use of both tetraethylthiuramdisulfide and chlorprophenpyridamine were discontinued, and the eruption cleared up within three or four days.

On Feb. 1, 1951, the patient resumed the use of tetraethylthiuramdisulfide along with 50 mg. of tripelennamine hydrochloride twice daily. The eruption recurred almost immediately but was not as severe as previously. On Feb. 7 the complete blood count findings were not remarkable, and at that time the use of tripelennamine was discontinued; however, the patient continued taking tetraethylthiuramdisulfide. Within a couple of days the acneform eruption was definitely more prominent. On Feb. 13 the patient resumed the use of tripelennamine in the previously mentioned dosage along with the use of tetraethylthiuramdisulfide. The large cystic lesions were gone within three days, but small acneform lesions continued to develop. After 10 days use of both tetraethylthiuramdisulfide and tripelennamine was again discontinued, and four days later no active lesions were discernible.

At the present time the patient is not inclined to resume the use of tetraethylthiuramdisulfide because she feels that she can get along without it, and she does not "cherish the thought of a bumpy face." Perhaps she may be persuaded to resume taking it later, and I hope to have the opportunity of making further observations on the effects of the various antihistamine drugs on this eruption.

COMMENT AND SUMMARY

A case is described in which there developed repeatedly a cystic acneform eruption of the face, anterior chest, and back, coincident with the ingestion of tetraethylthiuramdisulfide (antabuse®). I feel reasonably certain that the patient took no alcohol at any time while taking the drug and that the eruption was in no way related to any product resulting from a combination of alcohol and tetraethylthiuramdisulfide. Insofar as I am aware, this occurrence has not previously been reported. Withdrawal of the use of tetraethylthiuramdisulfide repeatedly resulted in subsidence of the eruption. Use of tripelennamine (pyribenzamine®) in a dosage of 50 mg. twice daily seemed to favorably influence the eruption, particularly the large cystic lesions which the use of chlorprophenpyridamine (chlortrimeton®) in dosages of 4 mg. four times daily did not noticeably affect. Further observations are necessary to determine the value and relative merits of antihistaminic drugs in controlling this type of eruption.

POSTOPERATIVE ACUTE PANCREATITIS AND LOWER NEPHRON SYNDROME

William F. Renner, M.D., Baltimore

Acute pancreatitis occurring during surgery in regions remote from the biliary tract or as a postoperative complication of such surgery apparently is rare. A search of the literature has revealed only two case reports.[1] In the case which is the subject of this report the symptoms of acute pancreatitis first manifested themselves in the operating room during a transurethral resection in a patient who gave no history of gallbladder disease, who did not imbibe alcoholic beverages, and in whom at autopsy no evidence of biliary tract disease could be found. The case is of special interest because of the coexistence of the lower nephron syndrome. Although the lower nephron syndrome is not an uncommon complication of acute pancreatitis, the almost simultaneous occurrence of the two conditions in a patient subjected to transurethral resection provokes the thought that the two pathological processes may have had a common etiology and, further, that the surgical procedure may have played a directly causative role in both. Recent investigative work lends support to such a hypothesis.

REPORT OF A CASE

The patient was a 60-year-old white accountant who had enjoyed good health all his life except for the development of progressive difficulty in voiding during the two preceding years. Past history and inquiry by systems were noncontributory except for the history of occasional postprandial flatulence.

Three days prior to admission to the hospital the patient noted onset of frequency, urgency, dysuria, fever, and malaise. A urine specimen showed many leukocytes. The symptoms responded well to the administration of sulfacetimide, but on the day of admission, Aug. 8, 1950, acute urinary retention developed. Upon admission an indwelling catheter was inserted. The patient quickly became afebrile and asymptomatic.

Physical examination was essentially negative except for enlargement (3+) of the prostate gland. A cystogram showed slight bladder trabeculation. The results of routine blood and urine studies were normal, with a hemoglobin value of 15 gm. per 100 cc., a nonprotein nitrogen level of 27 mg. per 100 cc., and only an occasional white blood cell in the microscopic examination of the urine.

On Aug. 5, 1950, three days after admission, the patient was subjected to a transurethral resection. Spinal anesthesia was employed. A total of 60 gm. of prostatic tissue were resected. A large amount of distilled water was used for irrigation. Bleeding was described as moderately severe and was well controlled by electrocoagulation. The operative procedure lasted 115 minutes. During the last 30 minutes of the operation severe epigastric pain developed, requiring the supplementary use of nitrous oxide and intravenous injection of pentobarbital (nembutal®).

The patient continued to complain of abdominal pain upon return to his room. Severe persistent nausea and vomiting developed. On the second postoperative day a slight but definite jaundice was detected. The result of a hemoglobin determination on this day was 8.25 gm. as compared with 15 gm. on admission, indicating the hemolysis of a large amount of blood. A recheck of the blood used for transfusion revealed no incompatability. The urinary output during the first postoperative day was 250 cc. A conservative plan of therapy was adopted. The patient was given 1,000 cc. of fluid per day in addition to that lost in urine and vomitus. The anemia was corrected. Aberrations in the blood chemistry were corrected as they arose. Heat was applied to the lumbar areas. As the days passed and the likelihood of spontaneous recovery diminished, the following procedures were employed: lumbar sympathetic block, intravenous administration of procaine solution, administration of benzazoline hydrochloride (priscoline®), intravenous injection of aminophylline, and finally continuous gastric lavage. Abdominal discomfort, nausea, and vomiting continued. The urinary output ranged between 55 cc. and 202 cc. The nonprotein nitrogen level climbed to 120 mg. per 100 cc. Episodes of pulmonary edema occurred. On the thirteenth postoperative day the patient died suddenly.

Autopsy.—At autopsy an extensive nonhemorrhagic pancreatitis was found with the characteristic surrounding area of fat necrosis. No abnormality was found in the liver, gallbladder, and bile ducts. The kidneys were large and swollen, with an average weight of 220 gm.

Microscopic Description of Kidneys: The glomerular tufts were atrophic in an enormously dilated capsule. Within the capsule there was an inspissated fluid. The epithelial lining was conspicuously hypertrophied. There was no thickening of the capsule and no hyalinization of glomeruli. The collecting tubules contained reddish albuminous casts and granular casts. There were marked swelling and vacuolation of the epithelial cells. Edema and a patchy distortion of the parenchyma due to proliferating fibroblasts and an accumulation of mononuclear cells were also observed.

COMMENT

It has been suggested that proteolytic enzymes released from injured tissue may be responsible for the renal damage seen in the lower nephron syndrome.[2] This hypothesis is based on the observation that a known proteolytic substance, trypsin, when injected into rabbits will cause pathological changes in the kidneys which bear a striking similarity to those observed in the kidneys of a man dying of crush injuries or burns. It is generally accepted that the proteolytic enzyme activity of trypsin is the cause of the pathological changes of acute pancreatitis.[3] Furthermore, it is known that proteolytic enzyme activity may be induced in dogs by hemorrhage, that prostate gland tissue has considerable proteolytic enzyme activity, and that during operations in man there is commonly a marked increase in proteolytic enzyme activity.[4] In view of these considerations, it would seem justified in the case under discussion, in which there was extensive resection of prostatic tissue and considerable hemolysis of blood, to propose as a hypothesis that the resulting release of proteolytic enzymes may have been responsible for both the pancreatic and the renal damage.

It is interesting that the literature on acute pancreatitis is not completely devoid of support of such a hypothesis. In a case reported by Rich [3b] acute pancreatitis developed in a 13-year-old girl shortly after she had been burned. It was suggested by the author that the administration of 5% dextrose solution may have played a role in the development of the pancreatitis. Equally valid is the suggestion that the release of proteolytic enzyme from the burned tissue caused the pancreatitis and the intra-

venous administration of fluids played a contributory role through hemodilution, since dilution of plasma is one method of activating proteolytic enzyme.

In another case acute pancreatitis followed the transfusion of incompatible blood.[5] This case and the one reported here are strikingly similar. In both cases acute pancreatitis and acute renal tubular damage developed promptly after the hemolysis of a considerable amount of blood. In both there was no prior history of biliary tract disease and no evidence of biliary tract abnormality at autopsy.

The occurrence of pancreatitis in such widely varied disease entities as acute appendicitis, mumps, carcinoma of the cervix, transfusion reaction, and pyemia is explained more readily by an alteration in the chemical composition of the body than in terms of local disease of the bile or pancreatic ducts.[6] Finally, the discrete and patchy distribution of the fat necrosis of acute pancreatitis, often involving areas of the omentum and mesentery far removed from the pancreas, suggests that the necrotizing agent is blood-borne rather than liberated from ruptured pancreatic acini.

SUMMARY

A case of postoperative acute pancreatitis and lower nephron syndrome is reported. Evidence is presented which suggests that there may be a mechanism involved in some cases of pancreatitis other than the distention and subsequent rupture of pancreatic acini.

METHANTHELINE (BANTHINE®) BROMIDE IN ACUTE PANCREATITIS

William W. Shingleton, M.D.
and
William G. Anlyan, M.D., Durham, N. C.

Recent studies conducted by us have revealed a reduction in the external secretion of the pancreas after vagotomy performed for peptic ulcer, and marked reduction in both volume and enzyme output of pancreatic juice when a patient is under the influence of a parasympatholytic drug, such as methantheline (banthine®) bromide.[1]

In addition, Ripstein[2] has reported a reduction in mortality from 72% to 24% by preliminary vagotomy in dogs in which acute pancreatitis was produced by injection of bile and trypsin into the pancreatic duct followed by ligation of the duct. In addition, we have succeeded in the prevention of pancreatitis by use of banthine® in dogs that had pancreatic duct ligation followed by a pancreatic stimulant, such as secretin or pilocarpine. Pancreatitis occurred in every instance in a similar group of animals that did not receive banthine®. Experimental and clinical evidence would suggest that human pancreatitis in many instances is caused by pancreatic duct obstruction in combination with active pancreatic secretion. Theoretically, either removal of the obstructing factor or inhibition of pancreatic secretion would interrupt the progress of the disease process.

REPORT OF A CASE

Mrs. B. V., aged 46, entered the hospital with complaint of severe, constant epigastric pain radiating through to the back of 48 hours' duration. She had had a similar attack of pain 10 months previously. The pain was associated with severe vomiting. There was no history of chills, jaundice, vomiting of blood, or melena. A gallbladder series done prior to admission revealed a nonfunctioning gallbladder.

Physical examination on admission revealed a blood pressure of 130/80; a temperature of 100.94 F. (38.3 C.), and a pulse rate of 100. There was marked tenderness with moderate muscle spasm in the midepigastrium. The remainder of the physical examination was normal. Laboratory studies revealed a hemoglobin of 12 gm. and a white blood cell count of 14,600. Urine examination was normal. The blood amylase value was 545 Somogyi units.

The patient was given 100 mg. of banthine® bromide intramuscularly, and within 20 minutes had almost complete relief of abdominal pain. She was then given 50 mg. of banthine® in the same manner every six hours for five days. She had no further abdominal pain, and no other drugs were required for relief of pain. Forty-eight hours after her admission to the hospital, a repeat of blood amylase determination revealed 55 Somogyi units. On the 10th hospital day, because of the evidence of gallbladder disease, the patient had an exploratory laparotomy which revealed the gallbladder wall to be slightly thickened but without evidence of acute inflammation. There were small stones present in the gallbladder. The common bile duct was not dilated and contained no stones or obstruction on exploration. Examination of the pancreas revealed it to be swollen, tense, and hemorrhagic in appearance, with several areas of surrounding fat necrosis in the omentum. The gallbladder was removed. Pathological examination revealed only minimal evidence of inflammatory reaction in the wall. The patient made an uneventful recovery.

COMMENT

Three additional patients with signs, symptoms, and laboratory findings of acute pancreatitis have been treated with banthine® bromide, 100 mg. given parenterally every six hours. All have had pronounced relief of pain, rapid fall in blood amylase values, and early general improvement. This would appear to be a satisfactory way of controlling an acute attack of the disease, to be followed by a search for any obstructing factors and their subsequent removal, when evident and possible, by conventional means. When obstructing factors are not evident, inhibition of external pancreatic secretion with banthine® during the active phase of the disease would seem a logical method of management. Such treatment seems to be on a sound physiological basis, since banthine® inhibits the nerve stimulus to pancreatic secretion by blockage of the vagus, and in addition inhibits acid secretion of the stomach, which is the chief mediator of hormonal stimulation of the pancreas.

PROCEDURE FOR BLOOD TRANSFUSION IN HEART DISEASE AND IN ELDERLY SUBJECTS

ADMINISTRATION OF SEDIMENTED ERYTHROCYTES WITH PATIENT SITTING UPRIGHT

Victor Ginsberg, M.D.
N. Robert Frank, M.D.
and
Richard Gubner, M.D., New York

In situations requiring transfusion of large amounts of blood, a practical difficulty is frequently imposed by associated disorders which restrict the ability of the heart to accommodate to an increased blood volume. Among the latter are various types of heart disease, nephritis, and toxemias of pregnancy and old age, generally, in which cardiac reserve is limited.

Shock and anemia of marked degree significantly affect the heart of an aged patient and may cause coronary insufficiency with accompanying myomalacia.[1] Pernicious anemia often affects those of advanced years among whom coronary artery disease is prevalent, and the latter condition necessitates caution if rapid replacement of normal blood values by transfusion is indicated.

The frequency of complicating conditions in the administration of transfusions among the various services t the Kings County Hospital has led to the development e blood bank of a simple procedure that lends itself iversal employment.

PROCEDURE

Red blood cells are allowed to settle in the bottles in the refrigerator. If not disturbed for approximately 48 hours, the cells settle so that there is about 300 to 350 cc. of red blood cells to 250 to 300 cc. of plasma. With the aid of an empty vacuum bottle the plasma can be siphoned off in a few minutes.

The table presents an analysis of the sodium content of the siphoned plasma and of the residual blood (determined by flame photometric analysis), and the hemoglobin values of the sedimented blood. In five of the 16 cases, washing of sedimented blood cells removed only minimal additional quantities of sodium so that no practical advantage is gained by this involved procedure.

The sedimented blood was administered with the use of gravity at an elevation of 4 ft. by means of an 18- or 17-gage needle, and with the patient in the sitting posture. Flow was adjusted at the rate of 3 to 4 cc. per minute. Usually a total of 250 to 350 cc. of sedimented erythrocytes was administered at one time.

COMMENT

The procedure described possesses a number of important advantages.

1. The total volume of fluid administered intravenously is reduced by practically half. Several investigators who have used concentrated red blood cell suspensions have emphasized this advantage.[2]

2. Fully three-quarters of the sodium content is eliminated by transfusion of sedimented red cells. The average amount of sodium eliminated in the discarded fraction totaled 967.41 mg. in the cases analyzed in the table. The administration of sodium is interdicted in patients with heart disease, preeclamptic and eclamptic toxemia, and lower-nephron nephrosis in the anuric stage.

* Amount after washing.

3. Transfusion, traditionally, has been given to patients in the recumbent position, in which the rapid return of augmented blood volume to the heart has predisposed to pulmonary edema. This is averted when the patient is placed upright in a chair during the transfusion. During the past two years in which this transfusion technique has been employed, none of the patients had dyspnea or pulmonary edema.

In circumstances necessitating transfusion of large amounts of red blood cells, partial exchange transfusions may be performed, whereby the patient's whole blood is removed and replenished by sedimented red cells. Subsequently, the patient's own erythrocytes are returned after sedimentation has occurred and the plasma has been removed.

It is important to distinguish between the administration of sedimented red blood cells and packed red blood cells. Preparation of packed erythrocytes requires centri-

fugation, and centrifuges accommodating large containers of blood of various sizes and shapes are not generally available.

SUMMARY

A simple procedure is described providing safeguards in the administration of blood to elderly patients and to persons with heart disease and associated disorders, in which introduction of a large volume of fluid into the circulation is hazardous. This consists of administration of sedimented red cells with the patient in a sitting position. Fully three-quarters of the sodium content of whole blood is removed by this technique.

GANTRISIN® (SULFISOXAZOLE)-INDUCED GRANULOCYTOPENIA

Dwain D. Hagerman, M.D.
and
Sanford A. Franzblau, M.D., Chicago

Gantrisin® (3,4-dimethyl-5-sulfanilamido-isoxazole, also known as sulfisoxazole, and NU-445) is a relatively new sulfonamide which is now being widely used in the treatment of various bacterial infections, particularly those of the urinary tract. Recently, a case of agranulocytosis following the administration of this drug was reported.[1] In a careful examination of the literature, the authors of this report were able to find only eight instances in which use of the drug had led to leucopenia.[2] Most of the other investigators have emphasized the low toxicity of the compound. We wish herewith to report another instance of bone marrow depression presumably caused by gantrisin,® in order to reemphasize the possible dangers inherent in its use.

REPORT OF A CASE

E. L., aged 74, was first seen at the Research and Educational Hospitals, University of Illinois, for surgical treatment of benign prostatic hypertrophy and chronic pyelitis. At the time of his first admission, the white blood cell count was 12,400 cells per cubic millimeter. Postoperatively, the patient did well, receiving penicillin, streptomycin, and aureomycin.

One month after discharge, one course of gantrisin® lasting 24 days (4 gm. per day in divided doses) was given in an attempt to control a continuing, moderately severe pyuria. This treatment was only partially successful, but the number of leucocytes in the urine diminished considerably. About two months later, a recrudescence of the pyuria led to a second similar course of gantrisin,® lasting one week. The sulfonamide was then replaced by aureomycin hydrochloride (2 gm. per day) for one week, and finally the use of aureomycin was discontinued, and gantrisin® was given again.

Two weeks after the institution of the third course of gantrisin,® and three days prior to the patient's second admission to the hospital, marked pharyngitis, laryngitis, and dysphagia developed. The temperature rose to 103 F., and examination of the blood showed a white cell count of 2,600 per cubic millimeter, with 36% neutrophils and 64% lymphocytes. Gantrisin® was immediately discontinued. Four hundred thousand units of penicillin procaine was given, and the patient was admitted to the Research and Educational Hospitals.

On admission, the patient stated that he was already improving. Physical examination showed the pharynx to be markedly inflamed, with multiple small ulcers covered by a yellowish membrane on the posterior pharyngeal wall, tonsillar pillars, and soft palate. His voice was hoarse and swallowing was difficult. The rest of the physical examination contributed nothing, and only a few pus cells and a trace of protein were found in the urine. Blood chemistry values were within normal limits, blood culture was sterile, and nose and throat cultures revealed no pathogenic organisms.

At the time of admission, the blood leucocyte count had risen to 5,700 cells per cubic millimeter, the erythrocyte count was 4,600,000 cells per cubic millimeter, the hematocrit value was 39%, and the sedimentation rate was 35 mm. per hour, corrected (Wintrobe). The differential leucocyte count showed neutrophilic myelocytes 1%, neutrophilic metamyelocytes 3%, stab forms 64%, polymorphonuclear neutrophils 9%, lymphocytes 7%, and monocytes 16%. The bone marrow was described as "cellular, with a marked left 'toxic' shift in the myeloid series; erythroid and megakaryocytic elements normal."

Mixed penicillin G and penicillin procaine, 3,200,000 units per day, was given for one week. The pharyngitis and laryngitis rapidly cleared, both objectively and subjectively, and a repeat blood examination nine days after admission showed a white blood cell count of 8,200 per cubic millimeter with 67% polymorphonuclear neutrophils, 28% lymphocytes, 4% monocytes, and 1% basophils. The neutrophils uniformly contained basophilic stippling. Fourteen days after admission the white cell count was unchanged, with 78% polymorphonuclear neutrophils, 16% lymphocytes, and 6% monocytes. All the cells showed normal morphological characteristics. The urine at this time contained only 1 or 2 leucocytes and no protein, and the patient was discharged.

It would appear that the administration of gantrisin® was followed by a severe granulocytopenia with formation of so-called toxic granules in the cells of the myeloid series. Fortunately, the condition was recognized at an early date and the medication discontinued with rapid subsequent recovery. The possibility that a drug sensitivity may develop after repeated use of a given drug must always be borne in mind when one is dealing with new agents, particularly those of the sulfonamide group.

The possibility that rest periods between courses of therapy with a given drug are important in the development of sensitivity is of some interest. In this respect, the observations of Dowling and Lepper and of Lyons and Balberor [3] are important. These authors demonstrated a threefold increase in incidence of drug reactions accompanying a second course of therapy with a given sulfonamide.

SUMMARY

A case of granulocytopenia following administration of gantrisin,® with rapid recovery following discontinuation of the medication and institution of penicillin therapy in massive doses, is described.

HEMORRHAGIC BULLOUS URTICARIA TREATED WITH CORTICOTROPIN

Gemma M. Lichtenstein, M.D.
and
Townsend B. Friedman, M.D., Chicago

Hemorrhagic bullous urticaria fortunately is rare. It is a serious reaction because it is usually associated with visceral involvement, and it may end fatally.[1] We have recently seen a case which had a favorable course and believe credit for this should be given to corticotropin (ACTH).

REPORT OF A CASE

A white man, aged 46, was seen by one of us (G. M. L.) on Aug. 14, 1950, because of cellulitis of the left leg extending from the midtibial region to the knee. He was given 400,000 units of depot penicillin G in peanut oil daily for five days. Ten days later generalized urticaria developed which did not respond to orally administered antihistaminic drugs. On Aug. 27, 1950, he was given a subcutaneous injection of 0.5 cc. of epinephrine 1:1,000, which caused pallor, profuse sweating, and tachycardia, but which had no effect on the urticaria. He was then given ephedrine hydrochloride orally, also without any pronounced therapeutic result. When seen again four days later, in addition to the urticaria there were multiple bullous lesions 3 to 5 cm. in diameter on the trunk and upper extremities, and numerous cutaneous hemorrhagic areas with a similar distribution. There was also a brawny edema of the arms, legs, chest, and face, especially marked in the lower lip and periorbital areas. The patient was hospitalized on Aug. 31, 1950. The temperature on admission was 101.4 F., pulse 98, and respirations 20. The white blood count was 4,550 at this time with the following differential: eosinophils 1, lymphocytes 12, monocytes 5, segmented polymorphonuclears 2, nonsegmented polymorphonuclears 60. The red blood cell count was 5,060,000 with a hemoglobin value of 15.8. The urine pH was 6.5, specific gravity 1,023, with 1+ albumin. The blood urea nitrogen was 14 mg. per 100 cc.

For the intense pruritus the patient was given an intravenous drip of 500 cc. of 0.1% procaine in isotonic saline, but with slight relief. It was then decided to administer 20 mg. of corticotropin intramuscularly every six hours. During the next 36 hours he complained at times of cramp-like abdominal pain. At no time was there any evidence of hemorrhage from either the gastrointestinal or urinary tract. He also complained of a sore throat, but no lesions were seen. After two days of therapy, no new bullae or hemorrhages appeared, and dosage of corticotropin was reduced on the sixth day to 10 mg. every six hours, and then 20 mg. daily for two days. The edema subsided gradually and was completely resolved on the fourth day. The bullae did not rupture, but dried by the fourth day. On the eighth day the patient was discharged, and has remained asymptomatic except for an occasional urticarial wheal.

COMMENT

Previously this patient had received penicillin parenterally in December, 1945, and in February, 1950, because of throat infections, as he had had rheumatic fever with residual mitral and aortic valve involvement, well-compensated. He had also used penicillin dust inhalations frequently during the previous two years for colds, without any toxic or allergic reaction. He had used a sulfonamide nose spray intermittently for about two years until April, 1945, when joint pains, which by exclusion proved to be due to the sulfonamide, developed.

CONCLUSIONS

A reaction to penicillin resulting in hemorrhagic bullous urticaria is reported.

The patient's condition was not improved by antihistamines, by ephedrine administered orally, or by subcutaneous epinephrine 1:1,000.

The bullous and hemorrhagic lesions cleared with the administration of corticotropin (ACTH).

104 S. Michigan Ave. (Dr. Friedman).

COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

This paper is one of a series requested by the Council on National Emergency Medical Service to inform the medical profession on problems pertaining to civil defense. It does not necessarily reflect, however, the opinions of the Council or of any other official body unless so stated in the article.

C. JOSEPH STETLER, *Secretary.*

ATOMIC BOMB INJURY: MECHANICAL INJURIES

Fiorindo A. Simeone, M.D., Cleveland

One-half to three-fourths of the casualties surviving an atomic bomb explosion over a metropolitan area can be expected to have incurred mechanical injuries. These are likely to be multiple and may be associated with burns and with the effects of nuclear radiation. Otherwise, there is nothing in the treatment of these wounds which sets them apart from those encountered daily in surgical practice. Any plan for the management of casualties in the event of an atomic bomb attack, however, must be conditioned by the fact that wounds will occur in overwhelming numbers. In addition, there will be widespread destruction of physical facilities. It is early after an atomic bomb attack that panic and confusion may exist, and it is during that time that previously made plans for the management of mass casualties will be most effective. In this paper, therefore, the early rather than the subsequent care of the wounded will be discussed from the point of view of the safest and most expeditious way of handling casualties in large numbers. The logistics and the management of injuries peculiar to an atomic bomb explosion have been described in previous articles of this series.[1]

The pressure wave resulting from an atomic bomb explosion is longer in length and in duration than that set

up by an explosion of a conventional nitroglycerine bomb. Except very close to ground zero, however, it does not reach the intensity of pressure needed to injure gas-containing organs (ears, gastrointestinal tract, lungs). The minimal pressure that will produce direct blast injury is generally taken to be 35 lb. per square inch, and this is not encountered outside a radius of 1,000 ft. (304 m.) from the detonation of an atomic bomb of the type used at Hiroshima and Nagasaki. Within this radius, almost complete destruction is expected. Survivors with direct effects of blast, therefore, will be encountered only exceptionally, if at all. None were noted among survivors at Hiroshima and Nagasaki.

Indirect injuries, on the other hand, will be encounered in great numbers. The collapse of buildings and helters, flying debris, and especially flying glass will ause a large number of mechanical wounds. If a bomb imilar to those dropped over Hiroshima and Nagasaki s used over a metropolitan area, mechanical injuries of varying degrees of severity can be expected in an area of some 200 to 300 square miles (500-775 sq. km.) bout ground zero.[2] Leader-Williams and Smith [2] have stimated that with a population density of 43 persons per acre in houses, there would be 27,400 killed and 5,900 wounded. This number of casualties, which might e at least doubled in a daytime attack over an industrial enter, would certainly overtax standard facilities even they were not demolished. It is imperative that careful lans be formulated for the effective use of local and eighboring medical facilities in such an eventuality, in order to provide a maximum of medical care with a minimum of confusion.

GENERAL CONSIDERATIONS

Triage.—Time, materials and personnel are spared by areful triage of casualties at collecting points [1b] set up in locations determined by factors such as the safety for ersonnel and the availability of routes for evacuation. The casualties reaching these points are segregated into severely wounded and lightly wounded. The former are vacuated to installations (regular hospitals which escaped destruction or improvised hospitals in factories, chools, etc.) only a litter carry or short ambulance ride away, where definitive surgery can be done. The lightly njured are evacuated to remote homes or hospitals for treatment. Only emergency treatment can be accomplished at collecting points. Resuscitation for severe hock can be started; hemorrhage can be stemmed; an open wound of the thorax can be converted into a closed one. Mature judgment by experienced personnel must be exercised at these points. It is desirable to designate certain installations as centers where certain types of wounds may be collected and treated.

Relief of Pain.—The majority of casualties can be made quite comfortable by first-aid treatment and do not require narcotics for pain. Fear, anxiety, and mental anguish are commonly mistaken for pain. They should be distinguished from the latter for they are treated differently.[3] Where pain is not an important factor in the clinical picture, small doses of barbiturates along with reassurance are safer and more effective than morphine. When pain is present, morphine or a similar narcotic should be used; but, as emphasized by Beecher,[4] certain features concerning the use of narcotics and other drugs shortly after wounding should be borne in mind:

1. The administration of a sedative (barbiturate) along with morphine renders the latter more effective.
2. In the presence of shock, drugs should be administered intravenously instead of hypodermically or intramuscularly. Failure of absorption from the skin or muscles renders the drugs ineffective. Moreover, if injection is repeated, dangerous overdosage may occur when the circulation is restored and absorption has returned to normal.
3. Among adults, an average dose of morphine hydrochloride (10 mg.) is usually as effective as larger amounts and has fewer side-effects. Except among addicts, it is seldom necessary to administer as much as 15 mg.

While morphine is an unquestioned godsend for the sick in pain, its misuse, aside from the question of addiction, has done more harm than good. Whether or not to stockpile morphine or its derivatives and substitutes and to make it readily available to non-medical rescue squads for use in case of civilian catastrophe deserves serious consideration. It is questionable whether narcotics should be used indiscriminately forward of the collecting points.

Wound Shock. — Number Requiring Treatment: Leader-Williams and Smith [2] estimated that an atomic bomb explosion similar to that at Hiroshima might result in 14,900 seriously injured casualties requiring treatment. In the Texas City disaster,[5] 800 of approximately 4,000 casualties were injured severely enough to warrant hospitalization. From this experience, it might be expected that one out of five of the casualties from an atomic attack would require treatment for wound shock. The enormous magnitude of the problem is obvious.

Manifestations: The clinical picture and the pathologic physiology of traumatic shock among casualties of an atomic bomb attack will differ in no way from that observed among battle casualties in World War II [6] or, for that matter, from that observed to result from an automobile accident. The fundamental abnormality in traumatic shock is oligemia. The manifestations are modified by the wound itself, the reactivity of the individual, and the treatment he has received. If the wound is not properly treated, infection may alter the picture. The oligemia of traumatic or wound shock results from the loss of whole blood from the circulation. After a few hours, most patients in traumatic shock show hemodilution in the active circulation. In contrast, patients with severe burns and with the crush syndrome show hemoconcentration. Oligemia in these patients results from the loss of plasma.

Correction of Oligemia: The management of wound shock requires correction of the oligemia, usually by replacement of whole blood, and treatment of the wound. Among the severely wounded, vigorous resuscitation is started when the casualty is first seen and precedes wound management except when the nature of the injury makes resuscitation ineffective, as in concealed bleeding or gastrointestinal perforation. Under these circumstances, it may be necessary to undertake wound surgery promptly as a vital part of resuscitation.

In the event of an atomic bomb explosion, blood will be a scarce commodity. As a conservative estimate in a catastrophe of this magnitude, 10,000 pints of blood would be required during the first 48 hours; and most of this, if available, would be used during the first 12 to 24 hours. For the greatest economy in the use of blood, as well as for the best interest of the patient, resuscitation must be conducted rapidly to permit wound surgery as soon as possible. Beecher[4] considers casualties ready for operation when:

1. The systolic blood pressure has already reached 85 mm. of mercury and is rising.
2. The pulse rate is falling.
3. The skin is warm.
4. Good color has returned to the mucous membranes.

Resuscitation is continued during the operative procedure according to indications for the particular case.

Degrees of Oligemia: While the correction of oligemia is guided by the patient's physiologic reactions, it is well to keep in mind the probable degrees of oligemia with which one is dealing. A normal adult may lose 15% of his normal blood volume without showing signs of shock. A casualty in severe shock, however, may have lost 50% or more of his blood volume. Mild degrees of shock may be associated with losses of 25 to 35% of the circulating blood. These values are useful as approximations for planning and not as absolute volumes which must be replaced invariably for casualties in shock.

Failure of Resuscitation: The preparation of casualties for surgery in the shock ward of a receiving hospital should be under the direction of an experienced physician or surgeon in constant attendance. He will be in the best position to determine when resuscitation has corrected shock sufficiently to make surgery safe. It is hoped that the diagnosis of irreversible shock will never be made and the patient therefore abandoned, because failure of resuscitation is often due not to irreversibility but to unrecognized bleeding, head injury, tension pneumothorax, massive fat embolism, atelectasis, or fulminating infection.

Stockpiling of Blood and Blood Plasma.—Whole blood cannot be stockpiled in sufficient quantities for a mass catastrophe. There is *no substitute* for whole blood, but use of blood plasma is a beneficial expedient until blood is available. In the case of burns and the crush syndrome, plasma can be used exclusively. When properly processed, blood plasma is safe and can be stockpiled in strategic areas. It, too, will be a rather scarce commodity. A constant search is therefore being made for other substances which can be used to expand the plasma volum such as gelatin, globin, dextran, and polyvinylpyrrolidon ("periston"). Since the effectiveness and metabolic fat of these substances is still being investigated, the storag of large quantities for mass casualties is scarcely advisable at this time.

Oral hypotonic salt solutions have been recommende for patients in shock.[7] This can apply only to the lightl injured, for the severely wounded should not be fed solid or liquids before surgery. In any event, assimilatio would be poor. In fact, though thirsty, patients in sho would vomit fluids taken by mouth; and this is especiall *true in burn shock* where, theoretically, such solution might be most useful.

Management of the Open Wound.—The principles resuscitation and the care of open wounds among ma casualties are directed toward the restoration of disturbe physiology and the conversion of the contaminated infected wound to one which will granulate without i fection and which can be closed within as short a peri of time as possible. Timing is important, especial among casualties in which open wounds may exist addition to exposure to radiation. As Pearse and Payne have pointed out, it is well to have such wounds heal within two weeks, because after that time the effects ionizing radiation on the healing properties of tissues m seriously interfere with recovery.

In the event of a major catastrophe, wounds must treated according to a master plan based upon simplici and effectiveness. Churchill[10] described such a plan a paper as timely now as it was then, based upon acti experience in World War II. He divided the surgical ca of the wound into three phases: initial, reparative, a reconstructive. Initial surgery is done as soon as possi after injury, often as a part of resuscitation itself. Rep ative surgery aims to close the wound and to effect he ing without infection and with minimal scarring. Ideall this is accomplished 5 to 10 days after wounding. Reco structive surgery is done electively weeks or months lat in order to effect accurate anatomic restoration and improve the function of tissues spared from injury. R parative and reconstructive surgery need not be discuss here, for by the time the patient is ready for them, t acute emergency arising from the atomic explosion over. By that time, casualties are well dispersed and tre ment can proceed according to generally accepted s gical principles.

Débridement of Wounds.—Débridement is the esse tial feature of initial surgery for victims of a mass cata trophe. By definition, this operation consists of the moval of traumatized, contaminated tissue. All gross devitalized tissue is removed. Complementary incisio must be made along natural planes and must be adequa for exposure of the depths of wounds. Most serious inf tions arise from foreign material or devitalized tiss overlooked when débridement has been cursory and s perficial. Large foreign bodies should be removed, but is unreasonable to spend hours seeking minute forei bodies. Casualties with small pieces of imbedded forei

material should be watched carefully for the development of serious anaerobic infection. The wound is covered with a simple dressing which, barring complications, is not removed until the patient is in the operating room for secondary closing of the wound. This practice spares personnel and avoids secondary infection.

With few exceptions débrided wounds must be left unsutured because it is impossible to be certain that all devitalized tissue has been removed at the time of débridement. Well débrided wounds will be ready for closure by the 5th to 10th day. By that time any devitalized tissue which had been left behind is easily identified and can be excised before closure.

While concessions should not be made to problems of plastic closure of wounds, it is useless to sacrifice skin needlessly, and incisions for exploring the depth of wounds should be planned so that secondary closure may be facilitated. Cruciate incisions and incisions over bony prominences should be avoided. Large muscles, blood vessels, and nerves should not be transected; and vital structures should be spared.

Antibiotic and chemotherapeutic agents are useful adjuncts to careful wound surgery. There is little, if any, evidence that such agents are useful locally.[11] They will not sterilize the poorly débrided wound and they are not needed locally in the well-débrided wound. Even after thorough débridement open wounds should be considered contaminated, and antibiotics should be used systemically as adjuvants to good surgery. Penicillin is useful not only for this purpose but also for protecting a patient whose hematopoietic system may have sustained injury from exposure to ionizing radiation.

Anesthesia in Mass Casualties.—This subject has been covered very well in a recent paper by Beecher,[4] and it need not be detailed again here. It is important to emphasize that most patients with simple wounds can be treated with local anesthesia, nerve block, nitrous oxide, or thiopental (pentothal®) sodium. The last is contraindicated in patients in actual or impending shock and in patients with injuries about the neck. For major procedures ether anesthesia with or without nitrous oxide induction remains the easiest and safest. Curare and its derivatives should not be used under the conditions which will probably exist where initial surgery is done.

SPECIFIC INJURIES

Crush Syndrome.—In a catastrophe where collapse of buildings takes place, a number of casualties will be trapped beneath rubble, timbers, and masonry.[12] The ischemia from pressure upon major blood vessels results in biochemical changes within striated muscle so that upon release of pressure and reestablishment of the blood supply, myohemoglobin and other compounds are liberated into the circulation. In man, through mechanisms which are not yet clearly understood, this results in injury to the kidney with ensuing degrees of oliguria and anuria. Death owing to renal failure is common. This has been called the "crush syndrome." [13] It was not observed in the Texas City disaster of 1946,[5b] nor was it described among casualties at Hiroshima and Nagasaki.[14] It was common, however, among the injured rescued from collapsed buildings during the Battle of Britain [12] and was seen under similar circumstances among battle casualties in World War II.[13a]

Bywaters [12] recommended the administration of substances at the time of rescue which would produce an alkaline reaction in the urine, on the basis that acid urine would cause precipitation of myoglobin or its derivatives and would lead to anuria by tubular blockage. This possibility has not been adequately tested, since such casualties have not been "alkalized" before rescue. However, when alkalization has been attempted shortly after release from the compression or during the period of oliguria and anuria, alkalization has not been effective.[13a] Doubt is cast upon the theoretical value of alkalization by experience in the management of blackwater fever and other related conditions.[13b,c]

It has been suggested that compression bandages may be useful in prophylaxis.[13d,e] They can be applied to the ischemic limbs easily by first-aid men trained in the management of such cases. Amputation of affected limbs is not recommended for prophylaxis. By the time cases which would be helped by it are recognized, damage will already have been done to the kidneys, and amputation would be ineffective.

Clinically and pathologically, there is no distinction between the anuria which is part of the crush syndrome and that which follows other forms of trauma and shock or incompatible blood transfusion and reactions to toxic agents. No method for inducing diuresis has thus far proved effective.[13b] The treatment of such casualties has been described by Burnett and associates [13f] and by Strauss.[13g] Essentially, overhydration and salt administration must be avoided, and insofar as possible, the caloric requirements should be provided in the form of carbohydrate.

Head Injuries.—There is no information concerning the incidence of head injuries among the casualties at Hiroshima and Nagasaki. Among some 4,000 casualties from the Texas City disaster [5a] there were over 200 patients with head injuries, most of whom had experienced periods of unconsciousness varying from a few moments to 48 hours. Thirty-five had sustained fractures of the skull. Following an atomic bomb explosion over a metropolitan area, one might expect 25 to 50 times this number of patients with head injuries, at least one-quarter of whom would require hospitalization. Except for general resuscitative measures, it is best to evacuate patients with head injuries directly and as expeditiously as possible to installations where neurosurgeons are available and definitive treatment can be accomplished.

---

[11] Certain serous-lined cavities, such as the joints and thorax, are thought to be exceptions to this rule. On the basis that antibiotics do not actively enter these spaces, these drugs have been instilled locally at the time of initial surgery as well as administered systemically.

Eye injuries are commonly associated with wounds of the head. Initial treatment should be conservative. Solutions containing atropine should not be instilled into the conjunctival sack. Enucleation should be done only when the irreparably damaged eye has to be removed as a part of adequate débridement. It should not be done without expert advice. Sympathetic ophthalmia is not a problem during the phase of management included under "initial surgery." This serious complication seldom occurs before a week or ten days from the time of injury, and there is some evidence that with the use of antibiotics it is to be feared less than it was a decade ago.

Wounds of the Chest.—Penetrating and crushing wounds of the chest require special mention because simple procedures may be life-saving in many instances. The need for the arrest of hemorrhage and for the correction of disturbed cardiopulmonary physiology constitute acute emergencies. Hemorrhage from penetrating wounds and from fractured ribs may be concealed and may occasionally lead to hemorrhagic shock and death without producing respiratory embarrassment. Bleeding within the thorax, often from an intercostal artery, should therefore be suspected when there is traumatic shock without trauma elsewhere. Air and blood should be aspirated from the chest when present in significant amounts. Continued rapid bleeding into the chest requires open thoracotomy.

Sucking Wounds: Cardiorespiratory balance is disturbed dramatically by three conditions: (*a*) the open chest ("sucking wound" of the chest), (*b*) tension pneumothorax, and (*c*) crushed or "stove-in" thorax. The emergency treatment for the sucking wound of the chest is immediate closure by any available means, whether it be by gauze pack, petrolatum gauze and adhesive, or even the flat of the hand. More adequate closure can be effected at the time of débridement when the patient reaches the first hospital installation away from the collecting point.

Tension Pneumothorax: Tension pneumothorax can be responsible for shock by interfering with the cardiac output, and dramatic improvement results from release of pressure by a needle inserted through the second or third interspace anteriorly. It is essential to keep this possibility in mind as a cause of shock. Once thought of, the diagnosis and treatment are easy. The needle can be connected to a water-seal or can be fitted with a rubber-dam flutter valve.

Rib Fractures: Forceful blows against the chest from flying blunt missiles or from collapsing walls and ceilings may result in fractures of the rib cage with interruption of the continuity of individual ribs in two or more places. The injury may produce traumatic asphyxia from the sudden increase in venous pressure. If the casualty does not succumb from serious injury to the intrathorac
viscera, severe respiratory embarrassment may resu
from the loss of fixation and the paradoxical moveme
of the damaged section of the chest wall. Pendulu
movement of air from one lung to the other increases t
dyspnea and cyanosis. Pain with respiration further i
pairs the effort of the patient to breath, increases t
dyspnea, and promotes the development of atelectas

Patients with traumatic asphyxia can be relieved

rect the paradoxical motion of the chest wall. The form
can be accomplished by procaine block of the involv
intercostal nerves. The latter can sometimes be acco
plished by adhesive strapping over a firm gauze pa
When more than five or six ribs are involved, it becon
necessary to immobilize them either by wiring the fr
tured ends together or by grasping them securely in hoo
at both ends of the intermediate segment and plac
them on traction.

Vascular Injuries.—The incidence of injuries to la
blood vessels in a catastrophe such as an atomic bo
explosion is not known. That some would occur as
result of flying glass and other secondary missiles is
be expected. Actual or suspected injury to import
vessels should be noted, and the casualty should rece
high priority for surgical treatment. There is noth
unique about vascular wounds to be expected after
atomic explosion. They will resemble those incurred
warfare and will present the same problems of mana
ment.[14a] Nerve injuries will be commonly associated
wounds of the blood vessels. Other than noting their p
ence, the treatment of wounds of the nerves themsel
should be delayed for some three weeks.

Mild to moderate bleeding can usually be contro
by means of a well-applied dressing. The tournic
should be reserved for the control of serious hemorrh

ted to the John Sealy Hospital in Galveston,[5] had fractures, 34 (26%) of which were compound fractures. It is to be expected, therefore, that large numbers of casualties will require treatment of simple and compound fractures after an atomic bomb explosion over a metropolitan area.

Fractures, whether simple or compound, must be splinted before the patient is moved. Narcotics are very seldom needed before a patient comes under medical supervision if a proper splint has been applied. Initial surgery for compound fractures should be done as early as possible: in installations near the collecting points in the case of the severely wounded, and in hospitals of the next echelon in the case of the lightly wounded. It is not necessary in this phase of management to go to extremes to effect accurate reduction, but careful débridement and immobilization are essential. When it is foreseen that a patient will be evacuated after a few days, the immobilization should be secured by means of plaster and not by traction. Plaster casts should be bivalved. The ventral half of the cast should be removed when the fracture is complicated by vascular injury. Accurate reduction can be secured at the time of reparative surgery.

It is important to bear in mind that clostridial myositis is associated with compound fractures even more commonly than with vascular injuries. Fracture patients must be kept under very close observation until the period during which such infections become apparent is past.

Wound Infection.—Adequate débridement and judicious use of antibiotics during initial treatment of casualties will minimize the incidence of wound infection. Infections which may occur will not become manifest until hours or days after the injury, when the bulk of the emergencies will have been treated and medical problems can be managed according to accepted principles without haste or confusion.

Tetanus Immunization: Clostridial infections warrant special mention because of their seriousness. The demonstration of the effectiveness of active immunization against tetanus by means of toxoid forms a brilliant chapter in the history of World War II and again in the present conflict in Korea. Unfortunately, immunization with tetanus toxoid is not universal among the civilian population. It will be impossible in the event of a major civilian catastrophe to determine the immunization status of the severely wounded. Consequently, it will be safest to treat all patients who incurred open wounds or severe contusions with prophylactic tetanus antitoxin (after the usual precautions regarding sensitivity) together with tetanus toxoid. The latter will serve as a booster dose in case the individual had been immunized with toxoid or as the initial dose for active immunization for those not previously immunized.

Prevention of Gas Gangrene: Clostridial myositis (gas gangrene) can be expected in any situation where mass casualties occur, for under such conditions débridement is likely to be delayed or inadequate. This infection can be fully developed as early as five hours after wounding, and the mortality is high. Early and thorough débridement is the best phophylaxis. The disease is not prevented by the use of antibiotics if the principles of wound management are violated. It has not been prevented by the prophylactic use of antitoxin. The disease has occurred in Korea despite adequate supplies of antibiotics, and Cutler and his associates [16] observed it among Air Force casualties treated prophylactically with penicillin. During World War II, the employment of sound surgical principles decreased the incidence of clostridial myositis from 65 early in the war to 1 per 10,000 casualties near the end of the war.

Patients who have incurred severe wounds should be kept under observation at the installation where initial surgery is done until the risk of life-endangering infection is over. In the case of clostridial myositis, most patients will have developed the disease within five or six days, if they are going to develop it at all. Plans should be made, therefore, to hold the severely wounded for about a week after initial surgery is done.

SUMMARY

The purpose of this report has been to emphasize two facts regarding mechanical injuries resulting from the explosion of an atomic bomb. First, the wounds are no different from those incurred in warfare or in civilian accidents, except that many will be complicated by burns and some by the effects of ionizing radiation. The principles of treatment are the same as those which crystallized during World War II and which are being demonstrated as sound in the present conflict in Korea. Second, the injuries occur in overwhelming numbers together with widespread destruction of facilities for medical care. Chaos can be avoided only if the casualties are managed according to a master plan which has stood the test of time. A chain of evacuation from the disaster area, as described in the first articles of this series, must be developed by industrial communities. Plans will vary from one community to the next, but all should aim at a design which will permit an orderly triage and evacuation of casualties from the target area to intact installations within the community and its suburbs. Those concerned with civilian defense must recognize that planning cannot be delayed. Time is required for plans to mature. There is no time for planning when a target area has been struck.

Essentials of Anesthesia.—I am convinced that the majority of anesthetic deaths can be prevented, especially when one is dealing with patients who are relatively "good risks." . . . Three simple rules should be strictly adhered to except under conditions of dire emergency in an outlying country district. These are (1) a means of rhythmically inflating the patient's lungs with oxygen to be available; (2) a laryngoscope to be at hand and in full working order should it be necessary to inspect the air passages and if needs be to insert an endotracheal tube; (3) suction apparatus in full working order to be at hand to suck out the patient's mouth and other air passages should vomiting occur or should there be threatened aspiration of any other foreign material such as blood.—Norman R. James, M.D., The Teaching of Anesthesia, Especially in Relation to Safety and Resuscitation, *Medical Journal of Australia*, July 14, 1951.

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

Narcotic drugs are often employed more or less routinely for preanesthetic medication without a full appreciation of their relative value for this purpose. The Council has authorized publication of the following report with the view of encouraging additional well-controlled and critical studies in this and related fields.

R. T. STORMONT, M.D., *Secretary.*

NARCOTICS IN PREANESTHETIC MEDICATION

A CONTROLLED STUDY

Ellis N. Cohen, M.D.
and
Henry K. Beecher, M.D., Boston

The use of a narcotic to support patients about to undergo anesthesia and surgery has a very long history; nonetheless, there are adequate reasons for examining the practice objectively. Such an examination begins logically with questions as to the purposes of the practice, its undesirable effects, and whether or not there are better ways to attain the desired results.

The beginning of this use of a narcotic was probably in 1850, when Lorenzo Bruno of Turin first mentioned the use of morphine as a hypnotic agent prior to the induction of anesthesia.[1] He used "the injection of morphine an hour before surgery . . to lessen psychic trauma." In 1869 Claude Bernard, working in Bruno's clinic, described how the injection into animals of small amounts of morphine one hour before the administration of chloroform reduced by half the quantity of chloroform necessary for deep anesthesia.[2] Since that time many others have described the advantages of morphine in preanesthetic medication. Some believed that use of this drug contributed significantly toward reducing the quantity of anesthetic agent required to attain a given plane of cyclopropane or of ether anesthesia.[3] However, other workers have reported that morphine used preanesthetically contributed little, or not at all, to a reduction of the amount of ether required for a given plane of anesthesia.[4] Since, in this country alone, millions of doses of narcotics are administered for preanesthetic medication each year, it is important to determine whether or not the practice is valid.

In recent times the recommended use of a narcotic in preanesthetic medication has been based, in several instances, upon careful observations. However, enthusiastic reports are generally derived from studies with animals having received very large doses of morphine in comparison with man. Moreover, with animals, the important subjective effects cannot be determined. When man is the experimental object, the favorable reports too often are based on few observations and frequently on clinical impression alone. Each new narcotic, often on the basis of little evidence, is accepted automatically as of value in preanesthetic medication. Hence, this is a legitimate field for inquiry on the part of the Council on Pharmacy and Chemistry.

The reasons offered for the use of a narcotic in preanesthetic medication fall into two principal categories.[5] First, it is desired to produce a desirable mental state in the patient, variously characterized as untroubled, serene, drowsy, and relaxed. There appear to have been no previous attempts to study these important subjective effects with and without morphine, or other agents administered in place of morphine. Second, there is the stated use of narcotics to reduce the quantity (blood-brain level) of anesthetic needed. These are legitimate aims. The first goal can be attained with narcotics. The purpose of this study was to ascertain if it could be accomplished as well, or better, with less hazardous agents. Concerning the second goal, no evidence has been found to prove conclusively that 15 mg. of morphine (¼ grain) reduces the blood levels of ether, or cyclopropane, or the quantity of thiopental sodium (pentothal sodium®) needed for surgery.

This paper presents evidence, then, which indicates that a narcotic is not essential in preanesthetic medication and that the attainable function of a narcotic in preanesthetic medication can be adequately performed by a barbiturate with fewer undesirable side-effects.

PROCEDURES

This work is based entirely on observations in man. Hospital patients were used as subjects, and they were divided into three equal groups to include approximately the same numbers o major and minor surgical procedures in comparable patients The 558 subjects were drawn in rotation from the daily schedul of operations.

No attempt was made to select patients for the experimen except to eliminate the extremes of age and weight and to ex clude patients with known contraindications to the drugs usec All anesthetics were administered by the anesthesia house sta which included both physicians and nurses in various degre of training, all under close supervision, and without knowled of what the premedication solution contained.

Three premedication solutions were prepared so that ea 2 cc. volume contained: (1) 15 mg. of morphine sulfate and 0 mg. of atropine sulfate, or (2) 90 mg. of pentobarbital sodiu and 0.6 mg. of atropine sulfate, or (3) 0.6 mg. of atropine sulfa A standard vehicle containing 8% ethyl alcohol, 70% pr pylene glycol, and water sufficient to make 100 cc. was us for premedication solutions, which were administered su cutaneously on the basis of 2 cc. of solution per 70 kilogra of body weight. *The contents of all solutions were unknown the patient, floor nurse, anesthetist, and examiner.* Code numb on solutions were changed on all wards at the end of each mon

A preanesthetic interview was carried out in the operat room during which the patient was asked a series of dir neutrally phrased questions in an attempt to evaluate sub tively his preanesthetic mental status while under the influc of the premedicating solution. These questions were prepa with the assistance of Dr. Jerome Bruner of the Departm of Social Relations of Harvard University: (1) Are you c fortable? (2) Are you worried? (3) Are you tense? (4) Are unusually happy? (5) Are you unusually sleepy? (6) Is y stomach upset? (7) Did you vomit?

The anesthetist recorded on a check list his own impress as to the patient's mental state; i. e., whether he was comforta worried, excited, happy, depressed, talkative, or nauseated the tables). As the anesthesia proceeded, the anesthetist recor the character of the induction and also his opinion as to whe or not a narcotic had been used in the premedicating solu (The use of eye signs in judging the presence or absence of

[5] Many papers have been written expressing aims of preanesthetic medication with which the authors do not agree. A recurrent theme is the use of narcotics to "lower the metabolic rate" so that "anesthesia will be easier." No evidence is given indicating that the doses used do in fact lower the metabolic rate, nor is any evidence produced indicating that this would be a sound procedure.

phine was prohibited.) Approximately one hour after the induction of anesthesia, venous blood samples from the antecubital veins were drawn under mercury into heparinized syringes and analyzed for cyclopropane[6] or ether[7] content. In addition to the fact that the premedication would still be effective, evidence in support of this time of drawing the venous blood samples is contained in Table 12, in which it is shown that in 12 cases approximate equilibration of the inhalation anesthetic agents had occurred by that time (judging by the similarity of anesthetic levels in arterial and venous blood). When thiopental sodium was the sole anesthetic agent, the number of milligrams used per minute was averaged and recorded. On the first postoperative day, the patient was interviewed again and asked the same questions as in the preanesthetic period. In addition, the patient was asked to recall the details of his anesthetic experience and to express an opinion as to the pleasantness or unpleasantness of his induction.

RESULTS

Cases Studied.—The 558 cases studied were divided as follows: Nitrous oxide and ether, 353; cyclopropane, 100; thiopental sodium (pentothal sodium®) alone and with nitrous oxide, 105.

Time Interval Between Premedication and Induction of Anesthesia.—The average time from the subcutaneous injection of the premedicating solution until the start of induction of anesthesia was 61 minutes. As shown in Figure 1, the majority of patients fell within the 40 to 80 minute period, which implies that their premedication was already effective[8] at the time induction was started. The average time from the induction of anesthesia until the blood was drawn for gas analysis was 58 minutes, or an average of 119 minutes after the premedication solution had been given to the patient. Thus, the premedication drugs were still effective when the blood samples were drawn.

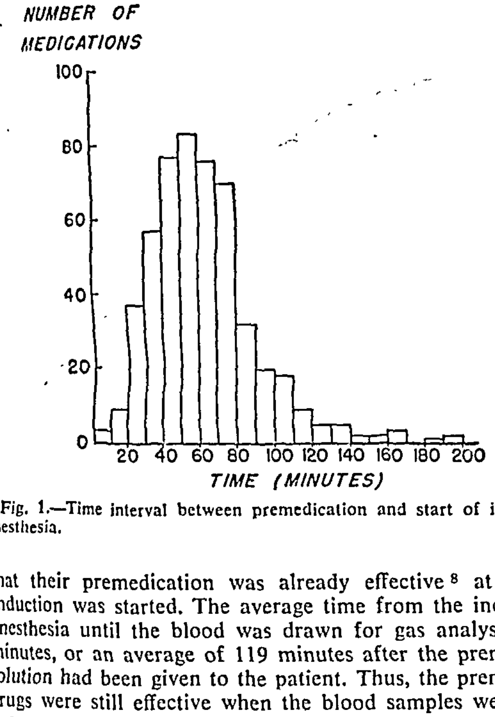

Fig. 1.—Time interval between premedication and start of induction of anesthesia.

Induction of Anesthesia.—The anesthetists were asked to characterize the nature of the induction. The results shown in Table 1 were obtained. From the anesthetist's point of view, the average induction of anesthesia was not influenced by the addition of either morphine or pentobarbital to the premedicating solution.

Time Required for Insertion of Endotracheal Tube.—An endotracheal tube was inserted as soon as relaxation of the jaw was sufficient. This provided a point at which to mark the onset of muscular relaxation and the completion of the induction period. The average time required for insertion of the endotracheal tube in 230 cases is shown in Table 2.

These figures show that the addition of morphine or pentobarbital to the premedicating solutions does not expedite the induction of anesthesia, as indicated by the attainment of a sufficient degree of muscular relaxation for the insertion of an endotracheal tube.

Anesthetist's Opinion of the Premedicating Solution Used.—The anesthetists were asked to evaluate the over-all adequacy of the premedication used and to express an opinion as to whether or not they thought a narcotic had been present in a given case. This last opinion was expressed independently of the characteristic eye signs of morphine medication. The errors of the guesses shown in Table 3 are such as to indicate that the anesthetists followed the instructions.

The data of Table 3 also suggest that the anesthetists were satisfied almost equally with all premedication solutions used, including atropine alone. In addition, 47% of the time the anesthetists were unaware of the presence of morphine when it had been used in the premedicating solution. There was an equal tendency to confuse the presence of pentobarbital with that of morphine. Moreover, the anesthetists mistakenly thought 34% of the atropine control group had been premedicated with morphine.

Morphine + atropine (72 cases)................................	18.3
Pentobarbital + atropine (73 cases)............................	18.2
Atropine alone (85 cases)......................................	17.5

Patient's Preanesthetic Physical and Mental Status.—After receiving a premedication solution, the patient was evaluated in his preanesthetic stage according to the following three categories. First, objective physical findings were recorded from examination of the patient: respiratory rate, pulse rate, and blood pressure. Second, a series of simple direct questions was asked the patient (see above and Table 5) to which he responded "yes" or "no." Third, the anesthetist recorded his impressions as to any apprehension, excitement, or euphoria manifested by the patient during his preparation for induction, regardless of his response to direct questioning (Table 5).

TABLE 3.—*Anesthetists' Estimates as to Adequacy of the Premedication and Whether It Included a Narcotic*

Premedication Agents	Adequate %	Inadequate %	Excessive %	Narcotic Probably Used %
Morphine + atropine (184 cases).....	72	27	1	53
Pentobarbital + atropine (182 cases)	72	26	2	46
Atropine alone (192 cases)...........	66	33	1	34

TABLE 4.—*Preanesthetic Physical Data*

Premedication Agents	Respiratory Rate	Pulse Rate	Blood Pressure
Morphine + atropine (184 cases).........	19.0	81	125/74
Pentobarbital + atropine (182 cases)....	19.0	84	126/74
Atropine alone (192 cases)................	19.6	85	127/83

The physical signs were recorded by the anesthetist before anesthesia was started (Table 4).

It appeared that the patient himself thought that morphine was slightly more effective (6%), in comparison with atropine alone, for reducing the amount of preoperative excitement and also for producing a sleepy state preanesthetically. In fact, a chi square analysis shows significance at the 0.05 level. Likewise,

8. Subcommittee on Anesthesia, National Research Council: Fundamentals of Anesthesia, Chicago, A. M. A. Press, 1944, p. 34.

there seemed to be a little less excitement under morphine than under the barbiturate, judging by the patients' statements; but this was not evident to the anesthetist (See last half of Table 5).

Patient's Postanesthetic Recall.—On his first postoperative day, the patient was asked the same series of questions that had been asked immediately before the induction of anesthesia. In addition, a check list was used to record details of both spontaneous and suggested recall of the patient's anesthetic experience from the time the premedicating solution was injected until the actual induction of anesthesia. The results of questioning postoperative patients are shown in Table 6.

There appears to be little difference in the power of the premedicating solutions used to prepare the patient for his anesthetic experience, judging by his recall. It can be observed from the data of Table 6 that postanesthetic patients were somewhat slower to recall the discomfort experienced during their preanesthetic phase than before induction; however, no significant differences are shown between the morphine, pentobarbital, or control group.

There also appears to be no differentiation in the patient's ability to recall details (both spontaneous and suggested) of his preanesthetic experience while under the influence of the three premedicating solutions. The patients were asked: "What do you remember happening to you in the hour or so just before your operation?" They were questioned regarding the hypodermic injection, the trip to the operating room, the placement of the mask or the needle for injection, and the movement from bed to the operating table. A score of 4 equals a 100% recall of the detail check list. Patients given morphine plus atropine got a score of 3.1, those given pentobarbital plus atropine, a score of 2.9, and those given atropine alone, a score of 3.2.

TABLE 5.—*Preanesthetic State: Patients' Answers to Direct Questions*

Premedication Agents	Discomfort, %	Apprehension, %	Excitement, %	Euphoria, %	Sleepiness, %	Nausea,
Morphine + atropine	5	32	27	7	17	3
Pentobarbital + atropine	4	35	34	7	15	4
Atropine alone	5	36	33	6	10	6

Anesthetists' Impressions as to Patients' State

Premedication Agents	Discomfort, %	Apprehension, %	Excitement, %	Euphoria, %	Depression (Sleepiness), %	Nausea, %	Talkati ness, %
Morphine + atropine	9	57	16	5	10	1	22
Pentobarbital + atropine	5	55	16	4	10	1	21
Atropine alone	10	62	21	3	8	2	20

TABLE 6.—*Patients' Estimates of Their Preoperative State on the First Postoperative Day*

Premedication Agents	Discomfort, %	Apprehension, %	Excitement, %	Euphoria, %	Sleepiness, %	Nausea, %	Talkati ness, %
Morphine + atropine	3	30	42	24	46	8	26
Pentobarbital + atropine	2	31	31	24	46	10	21
Atropine alone	3	34	41	20	40	9	16

The patients were also questioned on their first postoperative day as to the pleasantness or unpleasantness of the anesthetic induction. Their reactions are summarized in Table 7. Apparently, the patients were equally satisfied with all premedicating solutions used.

TABLE 7.—*Postoperative Memory of the Induction with Respect to Premedication Agents*

	Pleasant Induction, %	Unpleasant Induction, %	Indifferent Induction, %
Morphine + atropine	73	5	22
Pentobarbital + atropine	70	3	27
Atropine alone	73	7	20

Blood Anesthetic Levels.—Venous blood levels for ether were determined [7] in 101 patients and venous cyclopropane levels determined [6] in 76 patients. These blood samples were drawn approximately one hour (mean time=58 minutes) after the in duction of anesthesia. No attempt was made to draw them dur ing a particularly defined plane of anesthesia, except to be certain that all patients were in a surgical level of anesthesia. Thiopenta sodium in terms of milligrams of drug used per minute of anesthesia was calculated in 52 of the 54 [9] cases in which this dru was the sole anesthetic agent. The results are shown in Table

TABLE 8.—*Blood Levels of Anesthetic Agents One Hour After Induction of Anesthesia*

Premedication	Cyclopropane, Mg./100 Cc. (76 Cases)	Ether, Mg./100 Cc. (101 Cases)	Thiopental Sodium, Mg. Used/Mi (52 Cases)
Morphine + atropine	13.2 (25 cases)	103.1 (37 cases)	30.6 (17 cases)
Pentobarbital + atropine	13.9 (27 cases)	100.8 (28 cases)	31.7 (19 cases)
Atropine alone	13.6 (24 cases)	95.9 (36 cases)	31.3 (16 cases)

From these data, there does not appear to be a significa reduction in the blood levels of either cyclopropane or eth required for surgery when the various premedicating solutio are used. A "t" test for both cyclopropane and ether levels do not show a significant variation with the three premedicat solutions used. These results are in accord with the findings Calderone [4a] and of Potter and co-workers,[4b] and in disagr ment with other reported work in animals and in man.[3] Althou there was an apparent reduction in the amount of thiopen sodium required per minute when morphine was used for p medication, as compared to the control solution of atrop alone, this difference is not significant on a statistical le ($p = < 0.5$ and > 0.4). If a difference cannot be shown in d based upon 52 patients, any one person's clinical acumen wo not be great enough to detect it in a given case.

The venous blood levels obtained for the ether cases var from 57 to 160 mg. per 100 cc. These values are within norn reported ranges for the various planes of surgical anesthe Interestingly enough, the distribution of anesthetic levels (Fig. is almost in complete agreement with the results reported Potter and co-workers [4b] in which "all blood samples were dra at the second plane of the third stage after careful selection . . . one of three experienced anesthetists." Judging by t wide scatter of blood levels when Potter and co-workers thou that they were taking their blood samples at a constant level anesthesia, it is very difficult to define planes of anesthesia clinical judgment alone. (It is assumed that the venous blo reflects the concentration in the brain.) Accordingly, all samp were taken one hour after induction without using any furt criteria of depth of anesthesia. The types of cases were balanced in the three groups studied.

---

[9] In two patients some thiopental sodium was lost through a leaky connection; therefore, these cases were not included in the average.

Figure 3 shows the range of values obtained from the venous cyclopropane blood samples. They vary from 7 to 23 mg. per 100 cc. Again, these are in accord with other reported figures for surgical levels of cyclopropane anesthesia.[3a, b]

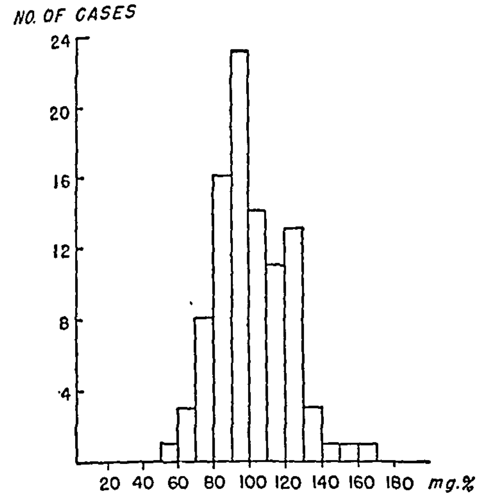

Fig. 2.—Venous blood ether levels.

Breakdown of Results by Anesthetic Agents.—A breakdown of the several categories of premedicating drugs was also made (Table 9) in terms of the individual anesthetic agents used (Cf. Table 1). The anesthetists expressed their opinion of the adequacy of the premedicating solutions as shown in Table 10 (Cf. Table 3).

When questioned on their first postoperative day, the patients expressed opinions as to their anesthetic inductions as shown in Table 11 (Cf. Table 7). The results of this tabulation reveal that, when utilizing a given anesthetic agent, there is little difference in response to the various drugs used for premedication. The patient's response to the various anesthetic agents, however, did vary (Table 11). For example, while an average of 64% of the patients were pleased with a gas-oxygen-ether induction, 70% were pleased with cyclopropane, and 92% were pleased when induction was made with thiopental sodium. This is in accord with clinical impression.

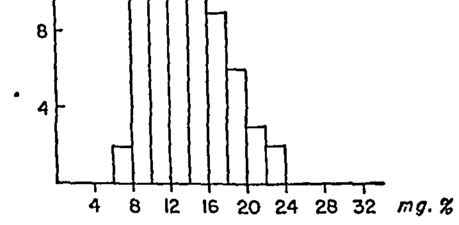

Fig. 3.—Venous blood cyclopropane levels.

Effects of the Premedicating Drugs on Oxygen Saturation and Carbon Dioxide Tension.—Twelve cases were selected at random in the cyclopropane and ether group and studied to evaluate any effects of the premedicating solutions on arterial oxygen saturation[10] or carbon dioxide tension.[11] Any depression of respiration would be shown by an elevated tension of carbon dioxide. In addition, simultaneous venous and arterial blood samples were drawn approximately 60 minutes after the induction of anesthesia in order to study the distribution of the anesthetic agent between the venous and arterial circulation. An attempt was made to maintain the plane of anesthesia as steady as possible while the blood was being drawn (Table 12).

Both oxygen saturation and tension of carbon dioxide were within normal ranges for the cases studied. Normality of the blood gases was so well preserved in the 12 patients, it seemed needless to carry this part of the work further. It was also apparent that, at the end of one hour's anesthesia, approximate equilibrium was established for the anesthetic gases between arterial and venous blood. Thus, the venous samples drawn one hour after induction should give a satisfactory indication as to the patient's plane of surgical anesthesia when averaged for rather large numbers.

COMMENT

As shown in Table 3, the anesthetists evaluated the preanesthetic medication as adequate more often when morphine or pentobarbital was used than when atropine alone was used; but there was no difference between morphine and pentobarbital for the purpose.

In Table 5, first part, although no important difference among any of the three preanesthetic solutions emerges, there was possibly a little less excitement when morphine was used. This difference is at the 5% level of significance. In the last part of Table 5, it is evident that the anesthetists could not detect any difference in excitement between the instances in which morphine and pentobarbital were used. In this same section of Table 5, one can find evidence which indicates that the patients impressed the anesthetists as being somewhat more apprehensive when atropine alone was used than when the other two agents were employed; but here again there was no difference between morphine and pentobarbital.

Table 9 contains evidence showing that the induction of inhalation anesthesia was a little smoother when morphine or pentobarbital sodium was used than when atropine alone was employed in the premedication. The evidence is only suggestive for ether; it is stronger for cyclopropane. Difficult induction was more common under cyclopropane unless morphine or pentobarbital sodium was used. There was no appreciable difference here between morphine and pentobarbital sodium.

* With respect to the premedication agents.

From the present study it is evident that pentobarbital sodium is an effective and satisfactory substitute for morphine in preanesthetic medication. Both morphine and pentobarbital contributed only a little to the improvement of the patient's preanesthetic mental state (insofar as it could be measured) and the induction of anesthesia. Both agents produce euphoria. This is a desirable result but one difficult to measure exactly. In other work in progress in the Anesthesia Laboratory of the Harvard Medical School, impressive euphoria has been produced by parenteral injection (as in the studies reported here) of pentobarbital. Presumably, the euphoria produced by the same dose of this agent is greater when administered parenterally than when it is given by mouth. This may be explained by its more rapid absorption when injected. Neither morphine nor pentobarbital contributed to reducing the actual blood levels of the anesthetic agents required to maintain surgical anesthesia. This does not imply, however, that morphine is to be discarded entirely in preanesthetic medication. Rather, its use or that of other powerful narcotics should be restricted to providing analgesia. Patients in preoperative pain should receive an analgesic agent in preanesthetic medication, but few patients coming to surgery have pain severe enough to require a narcotic.

SUMMARY AND CONCLUSIONS

1. A controlled study of preanesthetic medication was made in 558 patients undergoing anesthesia with ether, cyclopropane, or thiopental sodium. The drugs used for premedication included morphine sulfate and atropine, pentobarbital sodium and atropine, and atropine alone. These agents were all administered as "unknowns" and their effects characterized without knowledge of which one had been given.

2. Preanesthetic interviews with the patient, after administration of the drugs, an appraisal by the anesthetist, and a postanesthetic interview indicate few differences in the effectivenes of the premedicating drugs studied.

3. Smoothness of induction of anesthesia, muscular relaxation as measured by the time for insertion of an endotrache tube, depth of anesthesia as indicated by venous blood levels cyclopropane and of ether, and observations of milligrams thiopental sodium required per minute all show no importa and few significant differences with the three premedicati solutions tested.

4. Blood oxygen saturation and carbon dioxide eliminati were satisfactory in the cases studied.

5. On principle, it is desirable to reduce the use of narcoti whenever possible. As a further principle, morphine and simil agents should not be used because of their power to produ euphoria, except in conjunction with the treatment of seve pain or in patients who are dying, as with terminal cancer.

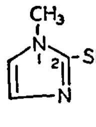
6. Unless pain is present, there is no need for a narcotic preanesthetic medication. Its function can be adequately filled by a small dose (90 mg.) of pentobarbital sodium. latter agent has fewer hazards associated with it than have commonly used narcotics.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as forming to the rules of the Council on Pharmacy and Chem of the American Medical Association for admission to New Nonofficial Remedies. A copy of the rules on which the Co bases its action will be sent on application.

R. T. STORMONT, M.D., *Secreta*

Methimazole.—Tapazole (Lilly).—1-Methyl-2-mercaptoi zole.—$C_4H_6N_2S$.—M.W. 114.17.—The structural formul methimazole may be represented as follows:



Actions and Uses.—Methimazole is similar in indication uses to propylthiouracil, but it is perhaps twenty times as p The side-effects are also similar to those of propylthiou nd have included skin rashes, urticaria, joint pains, and granulocytosis.

Dosage.—Initially, 5 to 10 mg. should be given three times a ay. After the hyperthyroidism is controlled, which may re-uire 30 to 60 days, a maintenance dose of 5 to 10 mg. daily ay be expected to keep the disease under control. While pro-acted treatment may finally extinguish the disease, the pre-rred course at present is to perform a thyroidectomy as soon the disease is controlled.

ests and Standards.—

Physical Properties: Methimazole is a white to buff, crystalline powder hich has almost no taste and a very faint odor. It melts between 145 and 8 C. One gram dissolves in about 4.5 ml. of water, in about 5.0 ml. of cohol, in about 4.4 ml. of chloroform, and in about 125 ml. of ether. A solution has a pH between 6.7 and 6.85.

Identity Tests: Dissolve about 50 mg. of methimazole in 5 ml. of water d slowly add an excess of iodine T.S. to the solution: at first the iodine lor is removed and upon continued addition a brown precipitate forms at finally turns brownish black.

A 0.0003% solution of methimazole, prepared as directed in the spectro-otometric assay, exhibits an ultraviolet absorption maximum at about 520 Å [E(1%, 1 cm.), about 1,357] with a minimum at about 2,200 Å.

Purity Tests: Dry about 2 gm. of methimazole, accurately weighed, in vacuum for 24 hours over phosphorus pentoxide: the loss in weight is t more than 0.5%.

Char about 0.5 gm. of methimazole, accurately weighed, over a low me. Cool the charred mass, then add 1 ml. of sulfuric acid and con-ue ignition until no carbon remains: the amount of residue present is t more than 0.1%.

Assay: (Methimazole) Transfer about 30 mg. of methimazole, accurately ighed, to a 1,000 ml. volumetric flask, fill to the mark with water and x thoroughly. Transfer exactly 10 ml. of the solution to a 100 ml. lumetric flask, fill to volume with water and again mix thoroughly. termine the absorbancy of the final solution (0.0003%) at 2,520 Å with spectrophotometer. The number of milligrams of methimazole present milliliter of the final solution = absorbancy ÷ 135.7. The amount of thimazole present is not less than 96.5 nor more than 102.5%.

Nitrogen) Transfer to a semi-micro Kjeldahl flask about 0.15 gm. of thimazole. Digest it for 4 hours with 7 ml. of sulfuric acid, 2.7 gm. of assium sulfate and 0.3 gm. of mercuric oxide. Cool the contents of flask and carefully add 15 ml. of water. Make the solution alkaline h 40% sodium hydroxide and then add 10 ml. of 40% sodium thio-fate. Distil the ammonia into 20 ml. of 4% boric acid. Using a mixed icator (1:5 methyl red T.S. and bromocresol green T.S.), titrate the monia liberated with 0.1 *N* sulfuric acid. Each milliliter of 0.1 *N* acid quivalent to 0.001401 gm. of nitrogen and 0.005708 gm. of methimazole. amount of nitrogen present is not less than 24.0 nor more than 24.8% ivalent to not less than 98.0 nor more than 101.0% of methimazole.

sage Forms of Methimazole

ABLETS. *Identity Tests:* Powder enough tablets to give about 50 mg. methimazole and add the powder to about 10 ml. of water. Mix roughly and filter the mixture. The filtrate responds to the identity tests ed in the monograph for Methimazole.

Assay: (Methimazole) Powder about 20 tablets and transfer to a 1,000 volumetric flask an amount, accurately weighed, equivalent to 30 mg. methimazole. Mix thoroughly and filter a portion of the solution, dis-ding the first 25 ml., and then transfer exactly 10 ml. of the subse-nt filtrate to a 100 ml. volumetric flask. Fill to the mark with water d determine the absorbancy of this solution at 2,520 Å with a spectro-otometer. The number of milligrams of methimazole present per milli-r of the final solution = optical density at 2,520 Å ÷ 135.7. The ount of methimazole present is not less than 95.0 nor more than .0% of the labeled amount.

Tablets Tapazole: 5 mg. Eli Lilly & Company, Indianapolis.

d Liver Oil Concentrate (Liquid) (See New and Nonofficial medies 1951, p. 465).

Capsules Cod Liver Oil Concentrate with added Vitamin D_3: ch capsule has a potency of not less than 12,500 U.S.P. units Vitamin A and of not less than 1,250 U.S.P. units of Vitamin White Laboratories, Inc., Kenilworth, N. J.

Liquid Cod Liver Oil Concentrate with added Vitamin D_3: cc., 30 cc., and 60 cc. vials. Packaged with an accompanying opper designed to supply in each two drops not less than 3,000 S.P. units of Vitamin A and not less than 600 U.S.P. units of itamin D. White Laboratories, Inc., Kenilworth, N. J.

arbol-Fuchsin Paint (See New and Nonofficial Remedies 1951, 57).

Carbol-Fuchsin Paint: 30 cc., 60 cc., 120 cc., and 480 cc. ottles. A solution of 1% boric acid, 4.5% phenol, 10% re-orcinol, 0.3% fuchsin, 5% acetone, and 10% alcohol in water, s. The Veltex Company, Birmingham, Ala.

Acet-Dia-Mer-Sulfonamides (See THE JOURNAL, Oct. 20, 1951, p. 759).

Tablets Incorposul: 0.5 gm. Each tablet contains 0.167 gm. each of sulfacetamide, sulfadiazine, and sulfamerazine. The Blue Line Chemical Company, St. Louis.

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports.

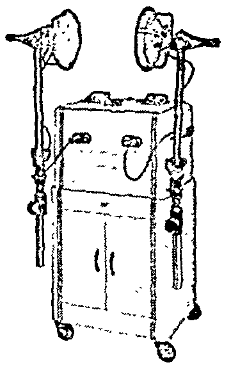
RALPH E. DE FOREST, M.D., *Secretary.*

LIEBEL-FLARSHEIM SHORT-WAVE DIATHERMY, MODEL SW-660, ACCEPTED

Manufacturer: The Liebel-Flarsheim Company, 303 W. Third St., Cincinnati 2.

The Liebel-Flarsheim Short-Wave Diathermy, Model SW-660, is an apparatus generating radio frequency energy at 27.12 megacycles for medical application. The housing of the generating equipment sits upon a cabinet which can be moved about on the floor on casters. Together, the two parts stand about 103 cm. in height (40¾ in.) and weigh 76 kg. (168 lb.). They are crated separately. The total shipping weight is 100 kg. (220 lb.). The shipping weight includes 2 air-spaced plates, 1 hinged drum, and 2 adjustable arms. For operation the apparatus requires a 60-cycle alternating current at 120 volts, and it draws 1,000 watts. (The Federal Communications Commission's Type Approval Number is D-539.)

The manufacturer uses a novel method of frequency control—a coaxial line oscillator, popularly referred to as a "cavity." The power output is controlled by a single control-knob, greatly simplifying the operation of the apparatus. The unit is equipped with a synchronous motor-driven timer, which may be used or not used at the discretion of the operator.



Liebel-Flarsheim Short-Wave Diathermy, Model SW-660.

In a laboratory acceptable to the Council, evidence was obtained that the apparatus performed as represented by the manufacturer. The unit has an output of 445 watts using air-spaced plates and 395 watts with the hinged drum. The Council on Physical Medicine and Rehabilitation voted to include the Liebel-Flarsheim Short-Wave Diathermy, Model SW-660, in its list of accepted devices.

ROCHESTER HEARING AID, MODEL R-1, ACCEPTED

Manufacturer: Rochester Acoustical Laboratories, Inc., 117 Fourth St., S. W., Rochester, Minn.

The Rochester Hearing Aid, Model R-1, is an electric instrument of conventional design. Without latch, knobs and clothing clip it measures 79 by 54 by 20 mm. The transmitter unit alone without batteries weighs 110.5 gm. With batteries it weighs 148 gm., and the receiver and cord add 11 gm.

Evidence of satisfactory construction and performance was obtained from sources acceptable to the Council. The Council on Physical Medicine and Rehabilitation voted to include the Rochester Hearing Aid, Model R-1, in its list of accepted devices.

Rochester Hearing Aid, Model R-1.

TRANSPOSITION OF AORTA AND PULMONARY ARTERY

Transposition of the great vessels, according to Harris and Farber,[1] has attracted attention as the most interesting and puzzling of congenital cardiac malformations. Defects such as persistent foramen ovale, ductus arteriosus, and abnormal aortic arches may be considered as mere developmental defects, or as evidences of the persistence of certain stages in embryonic development. In transposition, however, a radical departure from normal development has apparently taken place.

Abbott[2] defines transposition as an alteration in the position of the two great vessels relative to the ventricles of the heart, or to each other at their origin, so that they spring either from reversed ventricles, the aorta from the right, and the pulmonary artery from the left chamber (complete transposition), or from the ventricle to which they normally belong, but in reversed relationship (corrected transposition).

Of the many attempts to explain this anomaly the phylogenetic theory of Spitzer appears to be the most acceptable. It is based on the fundamental postulate of the orderly development of the organ, as a unit, in response to various conditions, forces and demands in a series rising from fish to birds and mammals.

In complete transposition the aorta arises from the ventricle receiving systemic venous blood and the pulmonary artery arises from the ventricle receiving oxygenated blood. Blood that is pumped by the left ventricle through the pulmonary artery to the lungs returns by the pulmonary veins and left auricle to its point of origin in the left ventricle. Blood that is propelled by the right ventricle through the aorta to the body is returned by the systemic veins and the right auricle to its starting point in the right ventricle. Thus, Blalock and Hanlon[3] point out, the systemic and pulmonary circulations are basically separate. A condition of this type is not compatible with life. However, there is generally some degree of communication between the two circulations by way of septal defects or other abnormalities. These abnormal communications allow some oxygenated blood to be shunted into systemic circulation, and some venous blood is similarly transferred to the pulmonary circulation. In the 123 cases collected by Hanlon and Blalock,[4] duration of life was 19 months. However, six of these patients lived 10 years or longer; if these are excluded, the average duration of life for 117 patients is only five and one-half months. These authors stress that in complete transposition an interventricular septal defect is the single compensating abnormality associated with the longest life expectancy. A patent interatrial septum is the next most favorable isolated defect, and the combination of these two gives the best prognosis of all.

Taussig[5] made clinical recognition of transposition of the great vessels possible by her description of clinical features. The fluoroscopic signs are very important. They show a narrow aortic shadow in the anterior-posterior position and a wide aortic shadow in the left anterior-oblique position, combined with enlargement of both ventricles and the absence of fulness of the normal pulmonary conus of the right ventricle. The condition leads to progressive cardiac enlargement and death during infancy. Occasionally a balance is established; it may then be compatible with life for a number of years. These children are greatly incapacitated and frequently squat when tired. They suffer from severe anoxia, and early and severe polycythemia and clubbing develop. A systolic murmur and gallop rhythm are common. There is slight cardiac enlargement and absence of fulness of the pulmonary conus. The physical markings extend nearly to the periphery of the lung fields; there are many discrete circulation shadows in the hilar region. Campbell and Suzman[6] emphasize a loud and booming pulmonary second sound as the most important physical sign. They consider as suggestive the following features in the lung fields: (1) the general mottling and increased density (2) dilatation of the pulmonary arteries and of thei main branches, and (3) expansile pulsation. The prognosis, according to them, is generally bad, the patient dying in the first few months. If, however, the septa defects are large enough for adequate mixing of the circulation of both sides of the heart, so that the child survives infancy, there is no reason why it should not survive much longer. They report on 25 children selected among 400 children with cyanotic congenital heart disease, a: having a transposition of the great vessels. The selection was made on the appearance of the lung fields on radioscopy and teleradiography and expansile pulsation of the pulmonary branches. Six of the children had cardiac catheterization and five of the six and two others had angiocardiography.

Blalock and Hanlon[3] attempted correction of this anomaly in 33 patients, all of them with preoperative diagnosis by Helen Taussig. Three types of operation were attempted: (1) some type of extracardiac venou or arterial shunt, (2) creation of an auricular septa defect, and (3) combination of these two methods. Th combined procedure offered the greatest likelihood o improvement. In the first 28 patients operated on, ther were 22 deaths. This exceedingly high mortality, the authors feel, was attributable to the precarious condition of the patients, to the use of procedures now considered unsound, or to technical errors. In 12 patients treated by the creation of an auricular septal defect and an anastomosis between the right subclavian and pulmonary arteries, eight are living with various degrees of improvement. A true anatomic correction of the defects has not been feasible so far.

GENERAL PRACTITIONER'S AWARD

In recognition of nearly 50 years of exceptional service to his patients and to medicine, Dr. A. C. Yoder, of Goshen, Ind., was awarded the fifth annual general practitioner's gold medal and named "general practitioner of the year" by the House of Delegates of the American Medical Association at the Los Angeles clinical session. The winner of this award is selected each year from a list of three names submitted to the House of Delegates by the Board of Trustees, who in turn receive nominations from each of the state and territorial medical societies. Others who figured in this year's final voting were Dr. Everett Beam Lattimore, of Shelby, N. C., and Dr. Clayton Willison, of Sault Ste. Marie, Mich.

Albert C. Yoder, M.D.

Dr. Yoder was born in La Grange County, Ind., in 1867. Starting his career as a schoolteacher, he served as high school principal for six years before attending medical school. After receiving a medical degree from Rush Medical College, Chicago, in 1902 he located in Goshen and has practiced there since that time. Answering calls first by bicycle, next by horse and buggy, and finally by car, Dr. Yoder has always given his best efforts to his patients. In the midst of a busy practice he has found time to participate in many civic programs. He was city health officer of Goshen for eight years. He has been active in his county medical society, serving as president on two occasions and as delegate to the Indiana State Medical Association for 35 years. Today, at an age when most men would have retired, Dr. Yoder sees patients in his office six days a week and maintains an active interest in current scientific advances in medicine. When told he had been selected as Indiana's nominee for the national honor, he said that he looked forward to many more years of service to the people of Goshen. Dr. Yoder was flown from his home to Los Angeles for the presentation of the gold medal award before the House of Delegates on December 6.

TUMORS IN FOOD-PRODUCING ANIMALS

While the common laboratory animals have been widely used in experimental cancer research, little attention has been paid to the research opportunities offered by the tumors of the larger food-bearing animals. Information concerning the prevalence and types of tumors present in these animals and the contributions that study of these tumors might make to an understanding of the etiology of cancer has recently been presented by Dr. Paul E. Steiner, pathologist at the University of Chicago, and Dr. John S. Bengston, veterinarian with the pathological division of the Bureau of Animal Industry.[1] On the basis of figures obtained from the meat inspection division of the Bureau of Animal Industry, together with an allowance for animals slaughtered by nonfederal inspected butchers and packers, these authors estimate that during 1949 some 152,856 food-producing animals marketed in the United States had tumors. They emphasized that this figure probably represents only about half the national total, since it does not include slaughtered animals with tumors localized in the viscera and hides, animals cured by veterinarians, or animals dying of tumors on farms and ranches. It is interesting to note that in cattle undergoing federal meat inspection, tumors now exceed tuberculosis as a cause for condemnation.

The economic loss due to tumors in meat-producing animals during 1949 was calculated by Steiner and Bengston to approximate 3 million dollars, which is conceded to be a gross underestimate, since it fails to take into account losses on farms and ranches, and other factors, such as the adverse affect of tumors on body weight and the loss from lower grading of meat in animals with localized tumors. Furthermore, it does not include the large loss due to tumors in poultry.

In addition to this great economic loss, there is also a tremendous scientific loss, since these tumors end as tankage and other by-products. As the authors point out, research on tumors in food-bearing animals could contribute to the solution of cancer problems in man as well as in animals. Large animals with large spontaneous tumors offer many advantages; for example, one leukemic cow, in which one lymph node may weigh 20 lb., would provide more research material than thousands of leukemic mice for chemical, viral, nutritional, and other types of studies. Again, certain animal tumors might throw additional light on the relative importance of heredity and environment. Thus carcinoma of the eye is found chiefly in white-face Hereford cattle originating in the southern and southwestern parts of the country. It is not known, however, whether some strains are genetically predisposed to this type of neoplasm or whether the geographical distribution is explained purely by environmental factors. In these and other genetic studies breeding records would be of great value. A challenging finding, too, is the relative absence in food-producing animals of common tumors of man, such as carcinoma of the stomach, colon, mammary gland, prostate, pancreas, esophagus, uterus, and bladder. While the lowered incidence may in part be due to the comparatively young age at which the animals are slaughtered, the roles of natural resistance or possible etiologic factors, e. g., inadequate exposure to carcinogens should be considered.

---

[1] Steiner, P. E., and Bengston, J. S.: Research and Economic Aspects of Tumors in Food-Producing Animals, Cancer 4: 1113, 1951.

Finally, as Steiner and Bengston emphasize, a wide range of tumors is found in food-bearing animals, mesoblastic tumors being relatively commoner and carcinomas relatively less common in animals than in man. Certain tumors in these animals may aid in the classification of some human tumors by exhibiting gradations between histogenetically related tumors that are missing or as yet undescribed in human material. In addition, the wealth of endothelial and mesothelial tumors provided by cattle should be particularly valuable, since these types of tumors are rarely seen and poorly understood in man.

BIOSYNTHESIS OF LABILE METHYL GROUPS

Since the promise of understanding the genesis and, nce, the control of neoplastic growths seems to lie in a more complete grasp of the fundamental sciences, attention in recent years has been directed to the finer details of the mechanisms of intermediary metabolism. Studies have been made of the biologic significance of the methyl group, its transfer from one compound to another in vivo, and its origin. In the well-known lipotropic effect in the liver brought about by methionine,[1] it appears that this no acid provides the labile methyl groups for the mation of choline, which promotes removal of the ex- ess fat, and current evidence supports the view that endogenous creatine is formed from glycocyamine through transfer of the methyl group from methionine. Also, when growth of young animals is retarded by removal of this essential amino acid from the diet, resumption of growth follows addition of homocystine and choline (a methyl donor). This evidence for the indispensability of the methyl group raises a question about possible endogenous production. Long ago it was postulated [2] that the animal body must secure preformed methyl groups for purposes of detoxication and possibly for the formation of creatine and choline; however, it has been shown [3] that when the heavy hydrogen content of body water is increased, the methyl groups in the choline prepared from the tissues contain heavy hydrogen, an indication of th in vivo synthesis of the methyl group. Again, this is suggested by the observation of Bennett and co-workers that certain rats continued to grow on a diet containin homocystine but devoid of preformed methyl groups. Intestinal bacteria are known to carry on synthesis of compounds of biochemical importance, but this possible ex ogenous source of the methyl groups was eliminated b repeating the experiment [5] on germ-free laboratory ani mals; the same suggestion of in vivo synthesis was se cured. Additional support was provided by experiments in which liver slices were incubated in a medium contain ing sodium formate, which was labeled with radioactiv carbon; both the methionine and the choline isolate from the tissue contained the C^{14}.

In a recent report [7] additional evidence for the in viv synthesis of labile methyl groups is brought forwar Sodium formate, methyl alcohol, formaldehyde, an sodium bircarbonate, each labeled with C^{14}, were inje ted into laboratory animals; the choline and the methi nine prepared from the tissues contained the labele carbon in every case, except when the bicarbonate w given. In another group of animals, C^{14}-formyl-L-phenyl lanine was injected and C^{14}-methyl stearate was fed, an it was found that the carbon of the formyl radical and th of the methyl group of the ester can be demonstrated the methyl group of the choline obtained from the tissu Thus, it has been shown that the indispensable meth group can be of endogenous origin; the raw materials, the cases investigated, being simple one-carbon con pounds, a hitherto unsuspected instance of the enormou factor of safety possessed by the animal organism.

SYMPOSIUM ON PESTICIDES

A panel discussion on the newer toxicants of medic economic, and pharmaceutical interest has been a nounced in connection with the national meeting of t American Association for the Advancement of Scienc This symposium will be held in the Philadelphia Munic pal Auditorium, Philadelphia, Saturday afternoon, De 29, 1951. A practical, informative discussion of the ec nomic, hygienic, and therapeutic applications of t newer pesticidal toxicants will be provided for phys cians, pharmacists, and other health personnel atten ing the meeting.

Many significant changes have taken place in rece years in the medical and public health employment pesticides. Among these are the use of improved chen icals for the treatment of disease, the control of filth ar disease-carrying insects and rodents, and the manageme of unwanted plants that harbor insects, blister the ski or produce undesirable pollens. These advances and the meaning in terms of professional practice will be sun marized by the panel discussants. from the chemica pharmacological, and pathological standpoint. Th speakers include members of the Committee on Pest cides of the A. M. A. and others prominent in this field.

ORGANIZATION SECTION

SUMMARY OF ACTIVITIES AT THE LOS ANGELES CLINICAL SESSION

Los Angeles will long be remembered for the Fifth Clinical Session of the American Medical Association, at which the attendance far exceeded that of any of the previous Clinical Sessions. The Council on Scientific Assembly, which is charged by the constitution of the American Medical Association with the preparation of programs for the general assemblies, gratefully acknowledges the help of the Local Committee on Arrangements n developing the program for the Los Angeles meeting, and it ommends especially the local co-chairmen, Drs. Walter Scott and J. Lafe Ludwig. The complete list of those who faithfully erved on the Local Committee was published in THE JOURNAL, Nov. 3, page 955. The majority of those who appeared on the program were from the vicinity of Los Angeles, but speakers rom other parts of the country also participated. The scientific program, arranged primarily to be of great interest to the genral practitioner, was presented in the huge Shrine Convention Hall. It consisted of general lectures, scientific exhibits, color elevision of surgical operations and demonstrations, medical motion pictures, and technical exhibits. The House of Delegates eld its meetings at the Biltmore Hotel, except for a special eveing meeting in the auditorium of the Shrine Convention Hall, where some 7,000 persons were addressed by Senators Robert A. Taft and Harry F. Byrd. About 2,000 who came to this meeting ould not be admitted because of lack of space in the auditorium.

he Scientific Program

The first speaker on the scientific program in the auditorium as Dr. Chevalier L. Jackson of Philadelphia, whose subject was he modern aspect of bronchoscopy. Dr. Jackson said that the ronchoscope was developed 50 years ago for the removal of oreign bodies from the lungs, but today 95% of its use is diected toward the diagnosis and treatment of disease, its three major uses being the removal of foreign bodies, the detection of umors, and the treatment of tuberculosis. The modern management of tuberculosis requires the use of a bronchoscope to check he diagnosis and to plan treatment, which depends on the exact ocation and character of the lesion. The bronchoscope should be vailable in every well-equipped hospital and sanatorium. Dr. ackson, in cooperation with Dr. John F. Heuber of Philadelphia, lso demonstrated in the scientific exhibits the important anaomic factors to be considered in bronchoscopy.

The second general lecture was presented by Dr. Lewis A. Alesen of Los Angeles, whose subject was the biological interretation of economics. Dr. Alesen, associate clinical professor f surgery at the College of Medical Evangelists and president-lect of the California Medical Society, urged the medical proession to take the lead in selling the American way of life. He aid that compulsory health insurance is just one minor phase of he total socialistic program that its backers are trying to foist n the American people, in spite of the fact that in 2,500 intances throughout history where collectivism has been tried, it as not once succeeded.

The third general lecture was presented by Dr. Geza de Takats f Chicago, whose subject was the limitations of sympathectomy n the treatment of diastolic hypertension. In reviewing a series f hundreds of cases, Dr. de Takats emphasized the care that must be taken in the selection of patients for sympathectomy. He ointed out that sympathectomy would not be successful in hyertensive patients who are suffering from an advanced stage of nephrosclerosis. There were no deaths in this series from the operation, and nearly all of the patients are enjoying better health in spite of the fact that there was no reduction in blood pressure in some of them. In others the blood pressure fell to normal, in some the progressive rise of the blood pressure was arrested, and in some patients, an intense, intractable headache was relieved.

Dr. Tom D. Spies of Chicago, Cincinnati, and Birmingham, Ala., gave a general lecture on chronic alcoholism. Dr. Spies said there are 4 million heavy drinkers in the United States, of whom 1 million are considered alcoholic addicts. Many of these drinkers, he said, suffer from organic ailments and many others from nutritional deficiencies. The attending physician must determine which of these two elements is behind the alcoholism. If the alcoholic was nonpsychotic before he began to drink, his case is handled best by therapy aimed at reducing his psychosis, which in turn can reduce his drinking; but if the alcoholic became psychotic as a result of drinking the treatment is to attack his alcoholism by chemical means; the psychosis can then be reduced also. Short-term therapy, Dr. Spies said, is completely lost on the alcoholic, and treatment extending a few weeks or even a year generally is not effective. Dr. Spies is now in the midst of study of alcoholism to try to determine the effect of nutrition on the craving for alcohol.

Dr. Sidney A. Portis of Chicago discussed advancements in the treatment of cirrhosis of the liver. Dr. Portis said that while heretofore cirrhosis of the liver was associated mostly with alcoholism, malnutrition, and cholecystitis, the incidence of this disease is on the increase and that additional causes of cirrhosis of the liver are recognized today. Many researchers hold now that there is a relation between cirrhosis and acute infectious hepatitis, which was widespread during World War II. The sulfonamides, aureomycin, and some other drugs have caused liver dysfunction, as have transfusions of blood and the use of nonirradiated plasma. He said that blood transfusion can no longer be considered an innocuous procedure, unless the medical history of the donor is known. For the treatment of the active stages of cirrhosis of the liver, Dr. Portis recommended a high protein diet with vitamin C and vitamin B complex and fat soluble vitamins. The intravenous administration of dextrose is of the utmost importance. A high caloric, highly nutritious diet is the most important single aspect of the long-term management of chronic liver disease. Such a diet should contain at least 3,500 calories. The food should be palatable, and feedings should be given at frequent intervals. In spite of the recent emphasis on dietary deficiency in the development of cirrhosis of the liver, the traditional prohibition of the use of alcohol by those suffering from the disease has not been changed.

Dr. John Z. Bowers of Salt Lake City reported that a mysterious poisoning had resulted from the processing of beryllium in some industrial plants. Beryllium has many applications in modern industry. Dr. Bowers said that the poisoning was apparently caused by nonradioactive beryllium and involved the skin and lungs of the victims. A few of the poisoned victims merely were living in the vicinity of a plant when taken ill. A few of the patients died.

Dr. Elmer Belt of Los Angeles discussed the cause and treatment of impotence. He said that deep emotional conflicts are the predominant causes of impotence. Impotence may be a reflection of the patient's feeling of failure in his daily life, either in business or social activities. Dr. Belt advised physicians not to take a light view of this condition when it has been determined that the evidence is psychic and not due to organic causes.

Dr. Robert M. Shelton of Pasadena, Calif., pointed out the change in the attitude of physicians toward diet in diabetes mellitus. It is realized now, he said, that fat and not sugar requires special handling in the diabetic diet. Fat, he said, was once the mainstay of the diabetic diet, but now is suspect. Contrary to the past custom, it is now believed that the diabetic should not be starved for carbohydrates and should be given a wider variety of foods than before and then given enough of the improved forms of insulin so that he can use the carbohydrates.

Dr. John M. Adams of Los Angeles discussed poliomyelitis and the coxsackie virus. He pointed out that group B of the coxsackie viruses is associated with diseases of the nervous system that simulate poliomyelitis and other forms of nonbacterial meningitis, while the group A viruses have been identified with an epidemic of acute, feverish illness characterized by blisters and ulcers of the throat. Discovery of these new viruses has resulted in some confusion in the diagnosis of poliomyelitis. Both the coxsackie and the poliomyelitis viruses are widespread in man.

Dr. Paul D. White of Boston said that medicine is well on its way to controlling rheumatic fever with its toll of lives from heart failure. Rheumatic fever, he said, has almost disappeared in areas where the standard of living is higher, such as suburban areas. This encouraging result is due to the development of the antibiotics and other drugs that control the streptococci. Dr. White emphasized also that many persons are still eating too much and that if they could reduce the unnecessary calories it would help to prevent many cases of heart diseases and diabetes.

Dr. Elmer Hess of Erie, Pa., discussed nephroptosis, pointing out that many persons with "floating kidneys" are having them either taken out or sewn back into place unnecessarily, as their painful symptoms often result from other causes. Dr. Hess reported on 241 such patients, in whom careful study showed that only 30 needed such an operation and that complete relief was obtained in only 14 of the 30 patients. He pointed out that the kidneys can move in their normal position as much as five inches.

Dr. Allyn J. McDowell of North Hollywood, Calif., discussed treatment in the primary management of burns. He said that the exposure method has been used with great success in the last two years. This method consists of the immobilization of the burned parts, with constant exposure to room air plus elevation of the burned parts to combat swelling. No dressings nor medicaments are applied. Dr. McDowell stressed that this method should not be considered as a routine treatment of all burns nor as a method to supplant all previous methods, but that fewer skin grafts will be necessary with the use of the exposure method of treating vere burns. In the event of an atomic disaster, it seems prob- at this time, that the exposure method may be the only ctical method of treating a large number of severely burned persons.

Due to limitation of space, it is impossible to abstract all of the many interesting contributions to this portion of the scientific program. A complete list of the speakers and their subjects was published in The Journal, Nov. 3. Those interested in any particular subject may write direct to the author for additional information. Some of the papers may eventually be published in The Journal.

Color Television and Films

Color television was one of the most popular features of the program. Space was available for 700 physicians to be seated before 14 color television receivers, but it was insufficient to accommodate all of those who wished to see the surgical operations and clinics presented during the meeting. In the forenoon, members of the staffs of the University of Southern California Medical School, the College of Medical Evangelists, and the Los Angeles County Hospital presented surgical operations on the color television program. These included operations on the gallbladder, thyroid, breast, and bones, and circumcision, hemorrhoidectomy, and the repair of hernia and fistulas. Childbirth by cesarean section was also shown. In the afternoon there were clinical demonstrations of the treatment of skin diseases, diabetes, cardiovascular diseases, tumors, poliomyelitis, and the care of premature infants. The surgeon described the operation as he proceeded step by step, his voice being carried by a small microphone tucked in his surgical mask. The television signals originated in the Los Angeles County Hospital and were relayed seven miles through the air to the Shrine Convention Hall. Of special interest on this program was an operation for coarctation of the aorta. The operation was performed by Dr. John C. Jones of Los Angeles on a man 20 years of age, and it was viewed on television not only at the American Medical Association meeting but at the University of Chicago Medica Center and at the headquarters of the Columbia Broadcastin System in New York City, where medical educators, medica school deans, and other physicians were assembled before television receivers. This was the first transcontinental transmissio of color television. The operation was performed Friday afternoon, after the various other portions of the program were ove and the fact that 700 persons remained to view this operatio indicates that physicians are greatly interested in medical colo television in the field of medical education. It was especiall interesting to learn that Dr. Walter W. Higgs of Park Rapid Minn., who first diagnosed the lesion in this young man som 10 years ago, flew to Chicago to watch the operation on h former patient on the television screen at the Chicago Medic Center.

The entire color television program was directed and spo sored by the Smith, Kline, and French Laboratories of Philade phia, which owns and operates its own equipment, which specially designed for medical purposes by the Columbia Broa casting System. The Los Angeles program was the 29th su program that this Philadelphia pharmaceutical firm has pr sented at medical meetings throughout the United State Canada, and Europe as a contribution to medical education.

The motion picture program, which was arranged with t assistance of the Committee on Medical Motion Pictures, co prised 11 different films, each of which was shown once ea day. Films on the following subjects were presented. The dia nosis of poliomyelitis, self preservation in an atomic attack, t exfoliative cytologic method in the diagnosis of gastric canc surgical approaches to the knee joint, physical medicine in t home treatment of arthritis, early diagnosis of uterine canc surgical management of primary hyperthyroidism, extrape toneal cesarian section, the bone bank, operation blood ban and heparin in the prevention and treatment of thrombosis. T number of seats available for this program was insufficient the first day and thereafter was enlarged to accommodate 2 persons. The total number of persons counted in the moti picture hall during the four-day meeting was 4,149. Again t medical motion picture demonstrated its usefulness as a mea of postgraduate education.

The Scientific Exhibits

The scientific exhibits, as always at A. M. A. meetings, tracted a large attendence. At this meeting the nearly 90 exhib were correlated with the scientific sessions in order to emphasi the subjects under discussion. Among the highlights was the e hibit on the treatment of fractures, at which several physicia demonstrated the latest techniques and actually applied plast casts where such treatment was necessary. Continuous demo strations were presented on the treatment of the fracture of t lower end of the radius, fracture of the ankle, and compressio fracture of the spine. The exhibit on fractures has for ma years been a popular feature of the scientific exhibits. Dr. Kello Speed of Chicago, who has been chairman of the Committee Fractures for some 25 years, was awarded a certificate of me by the House of Delegates at this meeting. Another highlight w the exhibit symposium on overweight, nutrition, and health, wi a question and answer conference, presented jointly by the Cou cil on Foods and Nutrition of the American Medical Associatio the American Dietetic Association, the Metropolitan Life Insu ance Company, the U. S. Public Health Service, and the Depa ment of Nutrition of Harvard University. Adjacent to th exhibit was a small auditorium where films were shown demonstrate the effects of overeating and the proper kinds diet. In this auditorium competent leaders discussed differe phases of the problem of overweight and nutrition and answere questions that had been mailed in or that came from the floo In all, there were five exhibits on this subject, with continuo demonstrations throughout the week.

At the exhibit demonstrating the danger of noise as a healt hazard, the physiology of the ear was reviewed at a booth spo sored by the Council on Physical Medicine and Rehabilitation. Specialists on job placement and rehabilitation discussed the rehabilitation and reeducation of patients suffering from ear disorders that have developed along with the industrial age. This booth was sponsored by the Council on Industrial Health. In the booth on audiometry and ear protection, sponsored by the American Academy of Laryngology and Otology, demonstrations were given on measuring the hearing acuity of the human ear. Members of the Acoustical Society of America presented short demonstrations of the fundamentals of the physics of noise. The Acoustical Materials Association demonstrated how to condition ceilings and walls in hospitals, industrial plants, and offices so that the noise hazard would be reduced.

The new method of artificial respiration, known as the back-pressure-arm lift method, attracted wide attention at this meeting and in the newspapers. THE JOURNAL, Dec. 8, 1951, page 1444, contains an article on this method in comparison with the older methods of artificial respiration. Dr. Archer S. Gordon, senior author of the article in THE JOURNAL, was present to aid in this demonstration.

Among the other exhibits were atomic medicine in general practice; problems of delivery—manikin demonstrations; tests for intoxication; definitive and differential diagnosis of poliomyelitis; diabetes detection by the physician; U. S. Air Force patient air evacuation system; practical gynecology; and evaluating the disabilities of the cerebral palsied. A complete list of the scientific exhibits appeared in THE JOURNAL, Nov. 3, page 962.

Technical Exhibits

After registering at the Shrine Convention Hall, visitors at the Los Angeles Clinical Session entered the technical exhibits, which occupied the entire main floor. There more than 150 manufacturers of medical equipment, of pharmaceutical and food products and medical book publishers displayed their products in a most attractive manner. This large room was crowded from morning until evening. Reprints of medical articles, descriptions of the contents of products, and, in many cases, samples were distributed. At some booths the exhibitors served samples of foods, and hot and cold soft drinks. The technical exhibits demonstrated important developments, new procedures and techniques, and other medical advances. The visitor left this room with new knowledge, and the commercial representatives obtained new ideas about their products, both to the ultimate benefit of the patient. Much interest was shown in two photomurals in the Walgreen exhibit showing 50 years of progress in the development of the Walgreen prescription service since the senior Walgreen opened his first drug store in Chicago in 1901. At the Devereux Schools exhibit, physicians learned that the schools provide facilities for the education and treatment of children who have academic or emotional difficulties. The State Journal Advertising Bureau exhibit created much interest. The 34 journals comprising the bureau have the same advertising standards as the A. M. A. publications. It was interesting to observe here that a new journal, the Maryland Medical Journal, will publish its first issue in January, 1952.

ABSTRACT OF PROCEEDINGS OF THE HOUSE OF DELEGATES AT THE CLINICAL SESSION IN LOS ANGELES, CALIF., DEC. 4-7, 1951

The actions of the House of Delegates at the Los Angeles Session are herewith abstracted so that the readers may have this information in digest form. The official proceedings will be made available, as in the past, in a booklet, which will be sent to all members of the House of Delegates and officers of the American Medical Association by the Secretary. This booklet will not be available for several weeks.—ED.

Report of Reference Committee on Credentials

Dr. H. Russell Brown, Chairman, reported that 182 delegates had registered, and the Speaker announced that a quorum was present.

Invocation

The Rt. Rev. Msgr. Thomas J. O'Dwyer of Los Angeles delivered the following invocation:

Direct, we beseech Thee, O Lord, all our actions by Thy holy inspiration, and carry these conventions on by Thy gracious assistance, that these conventions and all officers and members assembled therein may begin their deliberations from Thee and through Thee, and that they may be happily and successfully ended.

We pray Thee, O God of wisdom and justice, through whom authority is rightly administered, laws enacted and judgments decreed, assist with Thy holy spirit of counsel not only all the members of the medical societies of the United States but all who are appointed in city, state and nation to guard not only our health but our civic and social welfare.

We pray Thee at this time of crisis that the light of Thy divine wisdom many shine on the deliberations of our legislatures in the states and the deliberations of our Congress, that the laws and proceedings may be framed for our rule and government so that they may tend to the preservation of peace, the promotion of national happiness, the increase of industry, sobriety and useful knowledge, and may it perpetuate to us the blessings of liberty.

In this time of great crisis, we recommend to Thee, Almighty God, through Thy unbounded mercy, all our citizens throughout the United States, that they may be blessed in the knowledge and sanctified in the observance of Thy most holy law, and that they may be preserved in union and in that peace which the world cannot give. We ask Thy blessings on all here assembled. Amen.

General Practitioner of the Year

Nominations of Drs. Everett Beam Lattimore, Shelby, N. C., Clayton Willison, Sault Ste. Marie, Mich., and A. C. Yoder, Goshen, Ind., were presented by Dr. Dwight H. Murray, Chairman. Board of Trustees. On a second ballot the House of Delegates elected Dr. A. C. Yoder, Goshen, Ind., the General Practitioner of the year.

Telegram from California Teachers Association, Southern Section

The Secretary read a telegram addressed to the House of Delegates by J. Stanley Brode, President, California Teachers Association, Southern Section, and a suggested reply by the Speaker, Dr. F. F. Borzell, as follows:

> We extend to you our warm and hearty greeting. We honor you as representatives of men of medicine, who not only have been close to our profession in the task of dispelling ignorance and misunderstanding in matters of health, but have been so cooperative in protecting the welfare of our charges, the children and youth of America.
>
> You have our confidence in the manner and competence with which you do your work. We feel that we merit from you a like confidence in our competence in the tremendous task that is ours. We hope that you will make use of our AMA-NEA Joint Committee not only to consider the methods and practices of teaching health and of maintaining health standards of the schools and school personnel, but will use this "tie" also to learn something of the true nature and extent of current problems of education.
>
> On behalf of the 30,000 members of the California Teachers Association, Southern Section Directors we extend to you our cordial greeting and sincere desire to cooperate with you and the profession you represent both during your stay here and throughout the year.

SUGGESTED REPLY

It was the unanimous desire of the House of Delegates of the American Medical Association to have me express our deep appreciation of your wire of December 3. Our Association will do everything it can to cooperate with you in the task that both of us have before us. We appreciate the past cooperation of your Association with ours and we are glad to have it continue.

The telegram was received by the House and the Secretary instructed to transmit the suggested reply.

Address of Speaker

The Speaker presented the following address which was referred to the Reference Committee on Reports of Officers:

To the Members of the House of Delegates of the American Medical Association:

The Speaker intends to continue the policy adopted by this House some years ago of conservation of time and exercise of brevity, but not at the expense of the deliberation necessary to arrive at sound conclusions. Therefore, my remarks will be confined to matters referable to the conduct of the House.

We welcome those who are sitting in this body for the first time. For your benefit and to refresh the memory of our older delegates, let me remind you of some details intended to expedite procedure and at the same time give to all ample opportunity for discussion and debate.

All resolutions must be presented in proper form—providing eight copies. A staff of stenographers are at your service for this purpose.

In addressing the Chair, please announce your name and the state or group you represent. This is necessary for the benefit of the record as well as your listeners.

In presenting resolutions, try to confine your reading to the resolution, omitting the "Whereas" portions. The arguments or ons for the resolution are matters for presentation and argu- in the reference committee hearings.

eference committees will probably convene at 9:00 o'clock omorrow morning. The several committees will remain in session long enough to give all an opportunity to be heard.

If any resolution is of such a nature as to call for consideration in executive session, the procedure is that the resolution be resented by title with the request for referral to the Reference ommittee on Executive Session. This reference committee sitting in executive session will then consider the advisability or necessity of consideration in either closed or executive session. It will make its recommendations to the House. The time of such closed or executive session as decided by the House shall then be determined.

It is the privilege and responsibility of reference committees to call in anyone for advice or assistance in arriving at conclusions and preparation of reports. Because of past experiences the Chair would recommend that whenever a report may have a potential impact on our public relations, the committee call into conference our public relations or publicity experts and, if necessary, our legal department before submitting the report to the House. A simple change of wording may well be the difference between intelligent understanding of the intent of the House and misinterpretation with resulting faulty publicity.

REFERENCE COMMITTEES

SECTIONS AND SECTION WORK:
Truman C. Terrell, *Chairman,* Texas
Percy E. Hopkins, Illinois
George A. Woodhouse, Ohio
R. Stanley Kneeshaw, California
M. G. Westmoreland, Section on Pathology and Physiology

RULES AND ORDER OF BUSINESS:
Dwight L. Wilbur, *Chairman,* California
George G. Davis, Alaska
Charles E. Wagner, Delaware
Mather Pfeiffenberger, Illinois
Frank M. Wiseley, Ohio

REPORTS OF BOARD OF TRUSTEES AND SECRETARY:
L. Samuel Sica, *Chairman,* New Jersey
Joseph H. Howard, Connecticut
Eustace A. Allen, Georgia
Julian E. McFarland, Iowa
Val H. Fuchs, Louisiana

MEDICAL EDUCATION AND HOSPITALS:
Joseph D. McCarthy, *Chairman,* Nebraska
Harlan A. English, Illinois
George A. Earl, Minnesota
George S. Klump, Pennsylvania
Bruce Underwood, Kentucky

LEGISLATION AND PUBLIC RELATIONS:
R. B. Robins, *Chairman,* Arkansas
Alfred S. Giordano, Indiana
Floyd S. Winslow, New York
H. Gordon MacLean, California
George A. Unfug, Colorado

HYGIENE AND PUBLIC HEALTH:
Charles L. Farrell, *Chairman,* Rhode Island
W. Palmer Dearing, U. S. Public Health Service
F. Sanchez-Castano, Puerto Rico
Walter E. Vest, West Virginia
Joseph P. Henry, New York

AMENDMENTS TO CONSTITUTION AND BY-LAWS:
Leo F. Schiff, *Chairman,* New York
John F. Burton, Oklahoma
Willis H. Huron, Michigan
Felix J. Underwood, Mississippi
James L. Whitehill, Pennsylvania

REPORTS OF OFFICERS:
Carlton E. Wertz, *Chairman,* New York
Robert L. Schaeffer, Pennsylvania
William C. Chaney, Tennessee
Joseph B. Copeland, Texas
Jesse D. Hamer, Arizona

CREDENTIALS:
H. Russell Brown, *Chairman,* South Dakota
Karl S. J. Hohlen, Nebraska
Everett C. Fox, Section on Dermatology and Syphilolog
Laurence S. Nelson Sr., Kansas
Jacob W. Bird, Maryland

EXECUTIVE SESSION:
Gilson Colby Engel, *Chairman,* Pennsylvania
Stephen E. Gavin, Wisconsin
Herbert P. Ramsey, District of Columbia
Alfred S. Hartwell, Hawaii
Robert E. Schlueter, Missouri

INSURANCE AND MEDICAL SERVICE:
Raymond M. McKeown, *Chairman,* Oregon
Gordon F. Harkness, Section on Laryngology, Otology a Rhinology
J. Morrison Hutcheson, Virginia
Martyn A. Vickers, Maine
Robert L. Novy, Michigan

INDUSTRIAL HEALTH:
Millard D. Hill, *Chairman,* North Carolina
Charles T. Stone Sr., Section on Internal Medicine
James M. Faulkner, Massachusetts
Raymond F. Peterson, Montana
Daniel G. Gill, Alabama

MEDICAL MILITARY AFFAIRS:
Homer L. Pearson Jr., *Chairman,* Florida
Russel V. Lee, Section on Military Medicine
Roscoe H. Reeve, Wyoming
E. Vincent Askey, California
Robert B. Homan Jr., Texas
Consultants:
George E. Armstrong, U. S. A.
Clarence J. Brown, U. S. N.
Dan C. Ogle, U. S. A. F.

MISCELLANEOUS BUSINESS:
Warren W. Furey, *Chairman,* Illinois
Patrick J. Sullivan, Massachusetts
Elmer P. Weigel, New Jersey
J. Stanley Kenney, New York
Carl A. Lincke, Ohio

TELLERS:
John F. Conway, *Chairman*, New Mexico
Willard A. Wright, North Dakota
Hoyt B. Woolley, Idaho
John J. Curley, Massachusetts
Frank J. Elias, Minnesota

SERGEANTS-AT-ARMS:
Samuel J. McClendon, *Master Sergeant*, California
Edward P. Flood, New York
J. Wallace Hurff, New Jersey

REPORT OF REFERENCE COMMITTEE ON REPORTS OF OFFICERS

Dr. Carlton E. Wertz, Chairman, presented the following report, which was adopted:

Your reference committee wishes to commend your Speaker on his desire to conduct the affairs of this House in such a way as to conserve time, but not at the expense of the necessary deliberations to arrive at sound conclusions. Your committee wishes to emphasize that all resolutions should be presented in proper form, typed on the special forms which are available both at the meetings of the House or from the office in Chicago in advance. The proper preparation of all resolutions greatly facilitates the work of the Speaker and your reference committees. Your Speaker is supported in his caution in the use of words in reference committee reports and the danger of the wrong interpretation that might sometimes derive therefrom. The committee desires to express its great appreciation of the ability of the Speaker in his duties as presiding officer.

Address of the President, Dr. John W. Cline

Dr. John W. Cline, President, presented the following address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker, Members of the House of Delegates:

The atmosphere in which we meet here in Los Angeles is far different from that surrounding the Clinical Session in St. Louis, three years ago. In the intervening period, important and significant changes have taken place. The threat that we faced three years ago unified the profession to a degree never previously known. It has become a cohesive body capable of greater concerted and more effective action.

It has been said that experience is the greatest of teachers. We have learned many things that we should have known without having had to learn the hard way. In retrospect, it is always easy to recognize errors and to criticize. The past is history, and its principal importance lies in the fact that we may draw lessons from it that will be of value to us in the future.

The American Medical Association should never have permitted itself to be placed in a defensive position. It was, and is, a great public service organization conducting its activities in the public interest. We were sufficiently naïve to believe that this alone would protect us from the false accusations and malicious slander of small-minded, self-seeking persons who, as the result of political accident, found themselves in positions for which their narrow experience and limited concepts could scarcely be considered adequate qualification.

We have learned that a profession with high ethical standards and devoted to the public welfare is not immune to scurrilous attack or the now too familiar smear methods employed by demagogues and socialist-minded bureaucrats. Necessity has taught us to meet such assaults vigorously and effectively. As a consequence, American Medicine is no longer a wise choice as a whipping boy. The outstanding lesson to be learned from this experience is that we must never again allow ourselves to be placed on the defensive. While we labor to improve and expand our service to the American people we must be alert and keep our powder dry.

American Medicine has become a more important part of our integrated society as it has grown and advanced and as the interest of the public in matters of health and medical care has increased. The events of the past few years have shown us that we may not have been as conscious of our faults as we should have been. As an important, and in some ways a favored, segment of society we have heavy responsibilities to society as a whole.

Perhaps our obligations are no greater than are those of others who supply essential service in other fields. On the other hand, unless we measure up to them we shall not be accorded the respect to which we aspire and our freedom will be in jeopardy. We know that freedom of medical research, freedom of medical education, and freedom of medical practice are essential to a continuously improving standard of medical care. The loss of those freedoms would lead inevitably to a deterioration in the quality of medical care. The withering effect of bureaucratic control has been obvious throughout the world.

Let us take stock of our strengths and our weaknesses. Let us make that evaluation known, and let us seek the advice and assistance of others in improving the service we render.

One of our strong points is the nature of the American Medical Association and the character of its activities. Most of its nine million dollar budget is assigned to councils, committees, bureaus and departments that are devoting full time to activities leading directly or indirectly to improvement in the medical welfare of the public. Even a cursory review of these efforts, programs and projects will provide conclusive proof of that fact.

One of our weaknesses is that we have been content to do these things without making them known to the persons who benefit by them. Dissemination of this information would be far more effective in establishing the true nature of our organization than efforts to reply to attacks on us. Once the public understands the American Medical Association and its aims and objectives the assaults on medicine will be ineffectual.

Scientific medicine in the United States has progressed to a point never reached before any place in the world. Our standards of medical education and medical care have never been equaled, and these are the developments wrought by a free profession and educational institutions unhampered by governmental control. The principal problem has been and, to a large extent, remains the best means of distributing these advantages to all the people. In the main the approach is through voluntary health insurance. The growth and development of plans offering this coverage has been gratifying. When one realizes the short space of time in which this has been achieved it must be considered to represent satisfactory progress.

More than 77,000,000 persons now have some coverage against the costs of illness. About 22,000,000 are enrolled in Blue Shield and other medically sponsored plans, and 44,000,000 are enrolled in Blue Cross plans. This growth has been phenomenal. More than half our population has protection from the economic hazards of illness. On the other hand, we must not only expand the numbers enrolled but improve our plans. The exact direction the improvement should follow is not equally clear. As of this time, no one can say what will constitute the most desirable coverage in the future. The multiplicity and diverse nature of the plans creates a healthy situation. The very elasticity of the programs permits and encourages experimentation. The orderly process of evolution will produce a form that at some future date will be generally agreed on as embodying the most nearly ideal type of coverage. This process will not be limited by the legal enactments or the arbitrary decisions of government agencies inherent in any scheme of socialized medicine.

Certain plans have developed coverage for catastrophies that has proved workable, and the approach has been somewhat different in various parts of the country. More needs to be done in this direction and unquestionably will be done.

A few plans have begun experiments designed to include the older age groups and on an individual basis. More must and will be done along this line. We must proceed with cautious determination to find methods that will provide realistic coverage without endangering the solvency of our plans. The experience gained by numerous limited enrolments ultimately will demonstrate a satisfactory method free from the hazards of any all-inclusive, extensive plan blindly applied to large numbers.

The vast majority of our members support the prepayment mechanisms of distribution of the costs of medical care, but, here and there, individuals and some groups have withheld cooperation or give only reluctant support. There can be little question that voluntary health insurance is our greatest bulwark against socialized medicine. Even the proponents of socialized medicine clearly recognize this. We must have the full and vigorous support of the entire profession in this program.

The care of the indigent and near-indigent patient always has been and properly should be the responsibility of community charities, and local or state government. Conditions vary widely in different parts of the country. The studies we have conducted and are presently carrying out have been and will be helpful in improving this care.

The distribution of medical care is still not equal in all areas. Neither are other essential services, but the degree of maldistribution is far less than has been alleged. We have made substantial strides in cooperation with farm organizations in our rural medical care programs, the encouragement of general practice and the joint plans of the American Medical Association and the medical schools to interest young physicians in rural practice. Our physicians placement service, in conjunction with those of the state associations, will bring about further improvement. The public must realize that physicians will settle in areas where it is possible for them to practice good medicine. If proper facilities are provided by communities needing physicians, there will be little difficulty in inducing well-trained physicians to locate in them. This effort is the joint responsibility of the profession and the public.

We have opposed and must continue to oppose federal aid to medical education as proposed in S. 337, because of the inherent threat to the freedom of education. We recognize that many of our medical schools are in financial difficulty. The program inaugurated one year ago has progressed fairly well, but the response by individual physicians has not been nearly so great as it should have been.

Each one of us owes a debt to medical education. There always has been a discrepancy between the cost of education and tuition. No one of us contributed the full expense of his education in tuition. Let us discharge this debt promptly. I hope every state association and every county society will establish active agencies to bring this about.

We have in effect accepted a challenge, and it is up to us to e good. I hope every member of the House will return home ermined to see this campaign grow in strength and effectiveness.

Let us consider briefly what our patients object to in their medical care. In my travels about the country, and in letters I have received, the same or similar complaints against the profession recur with some frequency. The principal complaints are the cost of medical care, real or fancied overcharges, and the lack of availability of medical care.

Our members must be informed to a greater extent concerning the costs of medical care. The total cost of medical care has risen less than the cost of living, and the only important item of it that has risen to a greater extent is the per diem rate of hospitalization. This must be emphasized to our patients, and we must show them the reasons for increased hospital costs. In spite of the expansion of methods of diagnosis and treatment, the most significant item in the cost of hospital operation is labor. In most well-operated institutions it represents from 60 to 70 per cent of the total. Higher salaries and higher wages are the most important factor in advanced per diem costs. The average expense per illness has increased relatively little, owing to shortened periods of hospitalization. The heavy expense of serious and protracted illness should be guarded against by enrolment in the voluntary plans.

A good grievance committee, by whatever name called, operating effectively and adequately publicized, is the best method of dealing with the small percentage of the profession who are guilty of exorbitant charges. We have no place in our medical organizations for the chiseler or the fee-gouger. Let us see that the public knows this, and let us encourage patients to bring any instances of these practices or other unethical conduct to the attention of the county or state societies. These then must be dealt with vigorously and effectively. It has been my experience that where this is best done the public has greater confidence in the profession and complaints against it are minimal. My mail would indicate that the situation already has improved to a considerable extent, but more needs to be done.

It should be pointed out that a major portion of the complaints against individual physicians have their origin in misunderstanding and that this misunderstanding begins with th first visit by the patient to the physician's office or that of th physician to the patient's home. Greater effort to eliminat sources of misunderstanding will result in greatly enhance patient-physician relationship.

Medical care may be required at any time and must alway be available. The central telephone exchange methods work we in our larger centers, and cooperative arrangements in small communities can take care of the need. Medicine perhaps h no more vigorous critic than the person who experiences unusu difficulty in obtaining the medical care he believes essential f himself or his family.

As individuals and as organizations we must work mo closely with other individuals and organizations sincerely int ested in sound efforts to improve the medical welfare of t American people. We must work more closely with allied grou such as the American Hospital Association, the American D tal Association, the American Nurses Association, the Ame can Public Health Association and other professional orga zations. Interprofessional committees at the state and local lev as well as on the national plane will be of mutual advanta and will result in benefit to the public. An excellent example such cooperation is to be found in the successful conclusion the negotiations in the matter of hospital standardization.

We must take greater interest and cooperate more fully w other organizations that have laudable purposes. Cooperati with civic organizations, veterans' groups and labor, busin industrial and professional organizations will result in impro health programs of proper type. We of medicine must furn leadership in matters of health and medical care. No one can do so with the requisite knowledge and understanding.

Within our own organization we must strive for efficie and effective action. There is a tendency for bureaucracy grow in large organizations somewhat after the fashion of g ernment. Lines of authority must be clear, and those w authority must be held responsible. Our organization must sufficiently elastic to meet any situation that may arise, bu cannot afford the luxury of inefficiency. We require the wh hearted support of the full membership to make our progra as successful as they should be.

The National Education Campaign is being curtailed beca of the progress that has been made in building public support our cause. The expenditures for this purpose will represen very minor portion of our budget next year. In the past y the expenditures of the National Education Campaign were proximately $500,000 and will be about $250,000 for the com year. Contrast that, if you will, with the total American M cal Association budget of $9,000,000. This emphasizes the n for the greatest possible efficiency in our entire organization. even greater extent it points up the necessity for active vigor support of the policies and programs of the Association by ev member.

In the resolutions introduced into the House and in our offi pronouncements we should be mindful of erroneous impressi that may be created by failure to exercise sufficient care terminology. We should be as specific as possible in our exp sions. Generalization may give offense when none was inten and thereby damage the public relations of the Association.

In visiting different states I have found that in some Woman's Auxiliary has not been given the encouragement assistance it deserves. It represents the greatest potential f we can have in the field of public relations. The failure of s physicians to recognize that fact has hampered its effectiven The auxiliaries need to be encouraged and guided. If this done adequately we will obtain almost unlimited and energ support for our programs. The American Medical Associat the state associations and the county societies are limited in field of political activity to expressions of opinion on iss These organizations cannot and do not enter into election c paigns. The same restrictions apply to the auxiliaries.

While we are physicians, we first of all are citizens, and do not foreswear the rights and duties of citizenship by bec ing doctors. The level of citizenship of the physician always been high but too often of the passive type. It has been s with some justice that persons in a democracy get the kind government they deserve. Failure to exercise the rights and du of citizenship results in a type of government none of us desi

The experience of the past three years has taught us to distinguish between those figures in public life who adhere to American democratic principles and who are willing to defend them publicly and those who believe in socialistic ideas or will espouse them for political advantage.

Party labels mean little. It is the ability, convictions, character and courage of the individual that count. We have watched the creeping advance of socialism over past years. The efforts to socialize medicine are but a part of the broad front of socialization and cannot be separated from it. Who can envision an island of medical freedom in a sea of socialism?

The next year will be one of important decision. If we are to protect our heritage of freedom, if we are to preserve the standards of medical care, this decision must be the correct one. Should this country continue on the road that inevitably leads to socialism those things we cherish will be irrevocably lost. The history of other nations clearly demonstrates that beyond a certain point there is no easy way of return. It may not be easy to stop the progress toward socialism, but it is far easier and more realistic to halt it than to try to eliminate it after it has become an accomplished fact.

I urge you, not as members of this Association, but as citizens, to act as individuals, in informal groups and in association with others. I urge you to be militant and to be determined. The time to begin is not six months hence, but now.

The future freedom of medicine and the future of our country depend on the events of the coming year. Let it not be said that we who clearly see the importance of this decision were in default of our duties as physicians and citizens.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF OFFICERS

Dr. Carlton E. Wertz, Chairman, presented the following report of the Reference Committee on Reports of Officers, which was adopted:

Your committee believes that the address of our President was a masterful presentation of medicine's position in our American life. He stressed many points, some of which we would like to recall to your attention for re-emphasis.

1. We must never allow ourselves to be placed on the deensive again.

2. That a major portion of the vast activities of the Amerian Medical Association are devoted directly or indirectly to he medical welfare of the public.

3. With regard to the distribution of medical care, the main pproach has been through voluntary health insurance. The full nd vigorous support of the entire profession must be had in his program of voluntary health insurance. It is our greatest ulwark against socialized medicine.

4. The debt each of us owes to medical education is another oint stressed by the President. All physicians are urged to ontribute to the American Medical Education Foundation. Aid o medical education is every doctor's business.

5. Interest in, and cooperation with, community groups. Leadership must be furnished in all matters of health and medial care.

6. The encouragement and assistance to the Woman's Auxiliry is of vital importance. They should have the full support of he profession.

7. The right and duty of all physicians as American citizens o act as individuals, and in associations with others to be miliant and determined in the coming year.

It is gratifying to note the comprehensive viewpoint expressed by the President and it is hoped that all physicians will read the address in full.

Announcement of Contribution to American Medical Education Foundation

Dr. Dwight H. Murray, Chairman, Board of Trustees, presented the following announcement:

The Board of Trustees reports to the House of Delegates that a half million dollars has been appropriated to the American Medical Education Foundation for the calendar year 1952. This is the second contribution made by the American Medical Association to the American Medical Education Foundation, the first allocation of funds totalling one half million dollars having been made in 1950 for the year 1951.

In announcing this second contribution, the Board of Trustees wishes to underscore the importance of this voluntary campaign to raise funds for medical schools. Your support in this vital project has already been urged by Dr. Cline in his address to this House of Delegates. The Board of Trustees wishes to reaffirm its support of this program and to assure the House of Delegates that it intends to carry it on with utmost energy. We are hopeful that technics will be developed and actions taken that will assure a substantial flow of funds from voluntary sources to the medical schools each year that will significantly assist the schools to meet the financial problems they face.

The House of Delegates should also understand that the American Medical Association is underwriting the total expenses involved in raising these funds for medical schools. Every dollar contributed is being allocated to the medical schools.

Presentation of President-Elect Louis H. Bauer

The Speaker presented to the House the President-Elect, Dr. Louis H. Bauer.

Presentation of Vice President Oscar B. Hunter and Invited Guests

The Vice President, Dr. Oscar B. Hunter, was presented to the House by the Speaker, and Dr. Hunter, in turn, introduced the following distinguished guests: Mr. Lewis Gough, Past Vice Commander, American Legion; Mr. Walter Neeley, Aide to Commander Wilson, American Legion; Mr. Newell W. Stewart, retiring Chairman of the House of Delegates, American Pharmaceutical Association; Dr. Harold Hillenbrand, Secretary, American Dental Association; Mr. Albert V. Whitehall, Director, Washington Office, American Hospital Association; Dr. A. J. J. Rourke, President, American Hospital Association, and Mr. Donald Wilson, Commander of the American Legion.

Address of President of American Hospital Association, Dr. A. J. J. Rourke

Dr. A. J. J. Rourke, President, American Hospital Association, addressed the House as follows:

Mr. Speaker, Dr. Hunter and Friends: It is a real pleasure to receive an invitation from the American Medical Association for the President of the American Hospital Association to say a few words to you this morning.

Things are different and things are changing. It reminds me of the story of the man who called the doctor and said, "Come over quickly. My wife is very ill. I am sure she has appendicitis and needs an operation." The doctor said, "Why, I took her appendix out three years ago. Whoever heard of a second appendix?" The fellow said, "That's right, doc; but did you ever hear of a second wife?" I say things are changing the same way, because last fall Dr. John Cline came before the American Hospital Association and addressed us. It was a new step in the progress of our organization to have that close affiliation with you, and now to be here the same thing holds true.

I think the important thing for our two associations during the coming year is for us to be able to differentiate between the straw men which are put up as problems for us to beat down. There are some real differences, some real problems, some major factors to be discussed, but I hope that your organization and ours will be able to differentiate between them. Your President, Dr. Cline, this morning said that the public had to be reminded of some of the positive accomplishments of your profession, and I agree with him very thoroughly. Most of you in the room today can well remember when you worked behind an iron curtain in treating many of the diseases which we have dealt with, and we have removed that iron curtain and today are carrying on successfully medical miracles in our hospitals and by members of your profession.

I would like to echo the words of Dr. John Cline in saying that this interim committee that worked out the Joint Commission on Hospital Accreditation deserves a great deal of credit. It is another milestone in our experience of cooperation with your organization.

We also had working during the past year, under the able leadership of your Past President, Dr. Elmer Henderson, and our Past President, Dr. Charles Wilinsky, a committee which met once in an attempt to work over some of the matters of mutual concern to us. We have again reappointed that committee and are awaiting an opportunity when Dr. Cline and myself, as Presidents of the two organizations, can come together and carry on to a further point the matters which Dr. Henderson and Dr. Wilinsky carried on, and there are a number of mutual problems.

This matter of economics is an important one, and it delighted me this morning to hear Dr. John Cline say to you folks that it is a responsibility of the physician to point out to his patients why hospital costs are what they are today and also to point out that the hospital stay has been reduced to such a point that the total hospitalization does not amount to as much.

In addition, we have the problem of medical education, and I want you to know that the American Hospital Association is keenly interested in that, because I am sure the research that has been done by the few malcontents in our organization has proven beyond a doubt that hospitals cannot be run without doctors. Therefore it is important that we should have an interest in the education of the young physician as he comes along, and, most important in that, is the matter of clinical material. You and I remember that we were only able to learn our medicine because we had patients demonstrating the diseases that our professors could point out to us, and today we are having a great deal of difficulty getting clinical material in our hospitals for this purpose, and I think, in addition to giving your money, which you have done so beautifully, as Dr. Murray has pointed out to you, in this wonderful gift of a half million dollars, I trust each and every physician in this country will assume the responsibility of finding at least one patient in his private practice yearly who would be willing to enter the teaching services of the grand medical schools in this country. In doing that, you and I know that you are not offering them second class or steerage medical care, because it is you members of the American Medical Association who are directing medical care in our teaching hospitals oughout this country.

It gives me a great deal of pleasure to see over and over again eater and greater cooperation between our two organizations. would like just to relate one short incident. I came back from Hawaii about two weeks ago where I had the pleasure of conducting, with a co-sponsor, your own Dr. Leveroos, of the Council on Medical Education and Hospitals, a two-day institute in hospital operation. I want to point out to you that this is certainly a new innovation, that the American Medical Association and the American Hospital Association has conducted an institute in hospital operation.

Again let me thank you for the kindness that you have shown me in allowing me to appear before your House of Delegates, and may I extend to you my very best wishes for a successful clinical session here in Los Angeles. Thank you, sir.

Address of Mr. Donald Wilson, Commander, American Legion

Mr. Donald Wilson, Commander of the American Legion, presented to the House the following address:

Mr. Speaker, Dr. Hunter and Members of the House of Delegates: You honor me by your invitation to present myself before you for a few remarks. I am particularly honored that you have given me your permission to say something to you after you learned that I was by profession a lawyer. Having been on the receiving rather than the giving end of most of the speaking when I am associatd with doctors, you can understand full well how extremely honored I am on this occasion to have practically free rein, at least for a few moments.

I am reminded of the perennial dispute that goes on between your profession and my own by the story of the engineer who was injected into the argument with the doctor and the lawyer as to which of the three came from the most time-honored profession. The doctor, as is so frequently his wont, spoke first and said that he believed he could quote Scripture and prove that his profession was the most time-honored of the three. He said, "After all, you remember that Eve was created out of the rib of Adam, and that was basically a surgical proposition, so the Scripture itself will prove that the medical profession is the most time honored." The engineer was something of an orator and an arguer, and he looked at the doctor and said, "Doctor, I hadn't planned to use Scripture to prove my point, but since you have brought it up, you should be reminded that before Adam and Eve, God was said to have created order out of chaos, and that, of course, was basically an engineering function, so, by your own argument, by your own reference, I have demonstrated that the engineering profession is far more time honored than your own." The lawyer, as is his custom, spoke last and said, with a look of disdain at both of his colleagues, "Who do you fellows think made chaos?" I see you think that the lawyer did it!

Your profession, in all seriousness, and I say this even with due regard for my own profession, is the most honored of all of the professions in America. Members of your profession are respected not only for their professional views but also for their opinions on civic and social questions. There is no single individual in the average American community whose views are more respected than the community doctor. You, therefore, because of the extreme respect with which you are treated, have a tremendous obligation toward the American public. You have the obligation of informing yourselves as to all types of civi and social problems. You have the tremendous challenge which you meet so wonderfully to make yourselves as professionall competent as possible and to have the best conceivable medica administration that you can. Yours is a real challenge that come because of the respect with which you are treated.

You have been having, during the past many years, one of th most difficult battles that any profession has ever had to face You are in the vanguard, I would have you remember, of th resistance that America basically feels toward the encroachin forces of socialism. Yours is a profession that has been single out. Yours has been a battle that is noteworthy and will becom more noteworthy. I was delighted to read in the papers yesterday, as I came into Los Angeles, and delighted to hear something of a repetition of it by Dr. Cline today, that you plan t conduct a more aggressive, a more positive battle, than ever before, in order to overcome the forces of paralysis which woul beset your own profession. You can never afford to be place in a completely defensive position. You can't afford to hav any governmental agency or bureau or any other group i America point to a medical problem of any significance whatsoever that you have not already thoroughly considered and com up with a definite answer.

You have issued a call for support. You have asked that th body of American public opinion place itself behind you in you effort to overcome the creeping menace that you see so clearl I appear here as the representative of the American Legion, th greatest single organization, aside from your own, which is als irrevocably opposed to the socialization of American medicin

Our interest in American medicine springs from the fact th the primary reason for our existence is in the care of those o our comrades who were wounded in one or the other of the tw great world conflicts, either mentally or physically. We rely o the untrammeled genius of American medicine to help us mak good on the pledge that we made to those comrades of ours. W naturally, therefore, resist anything that would enslave th American medical mind or anything that would even tend to cu down on the remarkable genius that has been American medicine's in days gone by. Our interest, however, it not only wit veterans' medicine. You must remember that as an organizatio of over three million members we have, because of intimat family connections, approximately fifteen million Americans wh feel the same way that we do about the subject. So if you wan a body of American public opinion with you, let me assure yo that you have it with you in the American Legion.

We, of course, have problems just as you do. On some of th problems you and we have found ourselves not necessarily in disagreement but approaching the basic problem from a slightl different tack. We would issue to you something of a warnin for such use as you might care to make of it. There are man forces operating in this country, not all of which are directl advocating the socialism of your profession which you fear s much and fight so valiantly against. Some of the forces ar camouflaged; some of the forces are such because they don realize the full impact of the proposals that they make. On of those, for example, which was made in the not too distan past was that instead of having veterans' medicine we shoul lump all of public medicine into one tremendous administrativ and professional unit.

Let me say to you in all sincerity, gentlemen, that when you have veterans' medicine and prison medicine and public medicine and medicine for all depressed classes molded into one single administrative unit, run by the United States Government, you are much further along the path of socialism than you may realize. We opposed it, in part because of our opposition to socialism. We shall continue to oppose it and hope thereby to render something of a service not only to ourselves and to our comrades but also to American medicine.

We are a scrapping organization. We have had many fights in the past. We have won most of them. We are glad to stand shoulder to shoulder with you in this scrap, and we promise any who may feel differently that this is a fight which you and we will win together for the benefit of the American people.

Report of Secretary and Action Thereon

The reference Committee on Reports of Board of Trustees and Secretary, to which the Report of the Secretary (see THE JOURNAL, Nov. 24, 1951, page 1241) was referred, approved this report and recommended "that fuller clarification of the present membership status be made and be given the widest possible circulation among the membership." The reference committee also expressed "admiration for and appreciation of the efficiency with which the Secretary has dealt with the many duties of his office throughout the year" and recorded its "gratefulness to him for the splendid cooperation which he has afforded them." The report of the reference committee was adopted.

Report of Board of Trustees

Dr. Dwight H. Murray, Chairman, presented the report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1241-1273) which, with certain exceptions, was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

REPORT OF REFERENCE COMMITTEE ON REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Your reference committee approves the report on public relaions and desires to commend the Public Relations Conference ust concluded, for the effectiveness and adequacy with which it dvanced the interests of the Association in the field of public elations. It recommends that the proceedings of said conference e transmitted to all state medical associations for their inforiation and guidance.

Your committee approves the report on the Woman's Auxiary and wishes to record its conviction that the Woman's Auxiliary is an agency of great importance and assistance to he Association. In the critical year on which we are now enterng, your committee feels that every encouragement and aid hould be given to the Woman's Auxiliary on national and local evels, that thus it may more actively function and more efficiently achieve the ends of service to the interests of medicine which it so faithfully and so enthusiastically serves.

Your committee approves the report on "You and Your A. M. A." It regards this program as a very valuable and effective means of achieving, among the membership throughout the ountry, a more complete and sympathetic understanding of all he services and benefits conferred by the American Medical Association. It applauds the Board of Trustees and the Council on Medical Service for initiating this program and making it available for incorporation in programs at state levels. It strongly urges that all state associations take advantage of "You and Your A. M. A." and arrange to present it within their state boundaries for the information of their members and for the realization of the stronger unity and cooperation which it will nevitably generate.

Your committee approves the report on THE JOURNAL and the special journals. It is the opinion of the members of your committee that the American Medical Association may justly be proud of these publications and that it owes a debt of gratitude to all who labor in their preparation and publication. It is the particular desire of your committee to emphasize the fact that any member of the Association may, at choice, substitute any one of the special journals for THE JOURNAL and to urge that the members of the Association take advantage of this privilege in furtherance of their professional interests.

Your committee approves the report on *Today's Health*, which it regards as a very valuable means of bringing the accurate views and considered advice of outstanding and dependable medical authorities to the general public in terms that it can understand concerning matters in which it is vitally interested. Your committee is impressed with the fact, so clearly called to its attention by Dr. W. W. Bauer, the able editor of *Today's Health*, that the current operational deficit of the publication would be practically eliminated if every member of our Association would become a subscriber. Therefore, your committee earnestly urges every member to subscribe to *Today's Health* and to recommend it to patients as a dependable source of sound medical information.

Your committee approves the reports on the Standard Nomenclature of Diseases and Operations, the Quarterly Cumulative Index Medicus, the American Medical Directory, the Library, the State Journal Advertising Bureau, the Bureau of Investigation and the Bureau of Exhibits. Each of these is an important agency of service, and each deserves commendation for the quality of the service which it renders. Your committee notes with pleasure the increased activities of the Bureau of Medical Economic Research.

In the name of the House of Delegates and in its own behalf, your committee wishes to avail itself of this opportunity to thank the Board of Trustees for the diligence, assiduity and efficiency with which it regularly transacts the very complicated business with which it is called on to deal at the sacrifice of so much time and effort on the part of its members.

JOINT COMMISSION FOR THE ACCREDITATION OF HOSPITALS

The Speaker referred the report on the Joint Commission for the Accreditation of Hospitals in the Report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1242-1243) to the Reference Committe on Medical Education and Hospitals.

The report of the reference committee on this portion of the report of the Board of Trustees will be found in the report of the reference committee following the Report of the Council on Medical Education and Hospitals on page 1687.

REPORT OF COUNCIL ON RURAL HEALTH

The report of the Council (Committee) on Rural Health in the report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1246-1247) was referred by the Speaker to the Reference Committee on Hygiene and Public Health.

REPORT OF REFERENCE COMMITTEE ON HYGIENE AND PUBLIC HEALTH

Dr. Charles L. Farrell, Chairman, presented the following report, which was adopted:

Your committee commends the Board of Trustees for its elevation of the Committee on Rural Health to the status of a council. Your committee had before it the report of the Council on Rural Health and commends the Council for its support of local health councils as channels for teaching health rules to the citizen and assumes that it is implicit in the thinking of the Council that the local health councils will support the establishment of, and will work through, official full time local health departments. Your reference committee also commends and strongly supports the report of the Council on Rural Health to the effect that health is more than medical care and that the individual has a responsibility not only to himself, but to his community, to promote a healthful environment. Your reference committee recommends the adoption of the report of the Council on Rural Health.

REPORT OF THE WASHINGTON OFFICE

The Speaker referred the report of the Washington Office in the report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1247-1248) to the Reference Committee on Legislation and Public Relations.

REPORT OF REFERENCE COMMITTEE ON LEGISLAT AND PUBLIC RELATIONS

Dr. R. B. Robins, Chairman, presented the f which was adopted:

Reports of the Washington Office, the Co tion (see THE JOURNAL, Nov. 24, 1951, page mittee on Medicolegal Problems (see THE JOURNAL, Nov. 24, 1951, pages 1249-1250): Your committee approves these reports as written and recommends their adoption. It commends the Washington Office and the committees for their splendid work and reports.

REPORTS OF COUNCIL ON PHARMACY AND CHEMISTRY, THE LABORATORIES, COMMITTEE ON COSMETICS, COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION, COUNCIL ON FOODS AND NUTRITION AND BUREAU OF HEALTH EDUCATION

The Speaker referred to the Reference Committee on Hygiene and Public Health portions of the Report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1250-1256 and 1264-1267) as follows: Report of the Council on Pharmacy and Chemistry, Report of the Laboratories, Report of the Committee on Cosmetics, Report of the Council on Physical Medicine and Rehabilitation, Report of the Council on Foods and Nutrition and report of the Bureau of Health Education.

REPORT OF THE REFERENCE COMMITTEE ON HYGIENE AND PUBLIC HEALTH

Dr. Charles L. Farrell, Chairman, presented the following report, which was adopted section by section and as a whole:

Your committee had before it the report of the Council on Pharmacy and Chemistry. It directs your attention with commendation to the fact that the acceptance of products has been materially expedited in recent years. With the rapid advancement of chemotherapy, the annual publication of "New and Non-Official Remedies" is worthy of special commendation. Your reference committee recommends the adoption of the report of the Council on Pharmacy and Chemistry.

Your reference committee received the report of the Laboratories. The report is excellent and we recommend its approval.

Your committee received the report of the Committee on Cosmetics and believes the committee deserves special commendation for its activities and accomplishments in this highly important field. Adoption of the report is recommended.

Your committee reviewed the report of the Council on Physical Medicine and Rehabilitation and notes with regret the death of two members, and shares with the Council its sense of loss. Your committee notes with interest the activity of this highly important Council during the past year, and recommends the adoption of the report.

Your reference committee reviewed the report of the Council on Foods and Nutrition and heartily approves the report. It notes with interest the activity of the Council regarding legislation affecting food additives. It recognizes the difficulties inherent in this problem and endorses the action of the Council in supporting the principle of H. R. 3257. Your committee recommends the adoption of the report.

Your reference committee considered the multi-faceted report of the Bureau of Health Education and notes with interest and gratification the varied activities and progress of this Bureau. The Bureau deserves continued support for its excellent work. The committee notes with pleasure that *Today's Health* has grown in stature and importance, and recommends that every doctor keep it in his waiting room. In consideration of the basic responsibility of state health departments for promulgating measures for the health protection of their citizens, your committee recommends the addition of the Association of State and Territorial Health Officers to the list of organizations whose joint opinion as to the appropriate age at which the various immunizations should be administered is proposed to be secured by the National Congress of Parents and Teachers Advisory Committee on Health and Summer Round-Up in cooperation with the Bureau of Health Education. Your committee recommends the adoption of the report as amended.

REPORT OF COUNCIL ON INDUSTRIAL HEALTH

The report of the Council on Industrial Health in the report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1256-1258) was referred by the Speaker to the Reference Committee on Industrial Health.

REPORT OF REFERENCE COMMITTEE ON INDUSTRIAL HEALTH

Dr. Millard D. Hill, Chairman, presented the following report, which was adopted:

Your committee was impressed with the wide range of activities engaged in by the Council on Industrial Health and with the importance of certain services as they relate to defense industry. The recently prepared reports on integration of industrial medical services with community civil defense and on industrial manpower conservation met important current needs and should, in our opinion, be widely distributed to industrial management, the medical profession and official agencies dealing with federa contracts for defense material.

The committee strongly approves of the annual conferenc between representatives of the state medical association committees on industrial health and the Council at the time of th Annual Congress on Industrial Health. These meetings, togethe with the field services and the distribution of news letters, shoul promote the development of local industrial health services alon approved lines. Your committee particularly commends th joint program of education being developed between the Counci and the American Academy of General Practice.

Especial attention was paid to the proposed "Essentials o Medical Nursing Services in Industry." In the opinion of you committee this statement fills a long-felt want and should g far to define and protect the status of industrial nurses, particularly those without direct medical supervision. The committee recommends that the Council forward its work with th nurses and industrial physicians to the end that these principle receive wide distribution and acceptance.

In many of its activities the Council on Industrial Health ha found it necessary and desirable to seek consultation in speci fields dealing with noise, the older worker, chronic illnes human relations, workmen's compensation, atmospheric pollution, environmental hygiene and rehabilitation. The committee recommends the need to maintain medical interest and leadership in these fields involving as they do contacts and liaiso with representative groups in the profession of engineerin hygiene, sociology and psychiatry.

The committee also endorses the efforts to elevate standard of graduate training now being worked out with profession schools and standardizing agencies.

REPORT OF COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

The Speaker referred the report of the Council on Nation Emergency Medical Service in the report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1259-1260) to th Reference Committee on Medical Military Affairs.

REPORT OF REFERENCE COMMITTEE ON MEDICAL MILITARY AFFAIRS

Dr. Homer L. Pearson Jr., Chairman, presented the followin report, which was adopted:

The Reference Committee on Medical Military Affairs had fo consideration the report of the Council on National Emergenc Medical Service. All members of the committee were prese together with the consultants from the military services. Als present were the Chairman and Secretary of the Council o National Emergency Medical Service, some members of th Board of Trustees and others interested in matters before th committee. All entered freely into the discussions.

The report of the Council on National Emergency Medica Service was thoroughly studied and discussed. Your committe commends the Council on the fine work it is doing in militar and selective service activities, strongly supports the continuation of the policy of deferment of properly qualified pre-professional and professional students of medicine, dentistry an veterinary medicine and recommends that the Board of Trustee and Council make recommendations to this effect to the appropriate agencies.

Discussion of that portion of the report dealing with civi defense brought out that the nation as a whole was some year behind in its overall program for civil defense and your committee looks on this with some concern. It is therefore recom mended by this committee that representations be made by the Council and the Board of Trustees to appropriate agencies of government that there be closer participation on the part of the military services in civil defense planning.

Your committee notes the cordial appreciation expressed by the Surgeons General for the vastly improved relationships between the military medical services, the various advisory committees and the Council on National Emergency Medical Service of the American Medical Association and recommends that this activity be continued and further enlarged.

REPORT OF BUREAU OF LEGAL MEDICINE AND LEGISLATION

The report of the Bureau of Legal Medicine and Legislation in the report of the Board of Trustees (see THE JOURNAL, Nov. 24, 1951, pages 1260-1264) was referred by the Speaker to the Reference Committee on Legislation and Public Relations.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. R. B. Robins, Chairman, presented the following report, which was adopted:

Report of the Bureau of Legal Medicine and Legislation: Your committee approves this report and recommends its adoption. The fine work of the Bureau is noted with appreciation.

REPORT OF ASSISTANT TO THE GENERAL MANAGER, DEPARTMENT OF PUBLIC RELATIONS

The Speaker referred the report of the Assistant to the General Manager, Department of Public Relations (see THE JOURNAL, Nov. 24, 1951, pages 1271-1272) to the Reference Committee on Legislation and Public Relations.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. R. B. Robins, Chairman, presented the following report, which was adopted:

Report of the Assistant to the General Manager and Department of Public Relations: Your committee approves this report with special commendation and recommends its adoption.

Supplementary Report of the Board of Trustees

Dr. Dwight H. Murray, Chairman, presented the supplementary report of the Board of Trustees, the portions of which the Speaker referred to reference committees as follows: Joint Commission for Accreditation of Hospitals and Relation of Physicians and Hospitals to the Reference Committee on Medical Education and Hospitals; Resolution on Distribution of Medical Care to the Reference Committee on Insurance and Medical Service; Poisonous Household Products to the Reference Committee on Hygiene and Public Health; Funds for Medical Research and Resolution on Costs of All Technical and Professional Training to the Reference Committee on Miscellaneous Business, and Resolution on Publicizing American Medicine to the Reference Committee on Legislation and Public Relations. The Speaker delayed referral of the portion on the Coordinating Committee until the full report of that committee was received, and declared that the item on the Resolution on Free Choice of Physicians for Federal Employees was informative and did not require action or referral.

Joint Commission for the Accreditation of Hospitals: The Board of Trustees wishes to report that the following physicians have been selected to represent the American Medical Association on the Joint Commission for the Accreditation of Hospitals:

Dr. Gunnar Gundersen and Dr. Stanley Truman for terms of three years.

Dr. Dwight H. Murray and Dr. Herman G. Weiskotten for terms of two years.

Dr. Rolland J. Whitacre and Dr. Julian P. Price for terms of one year.

The report of the Reference Committee on Medical Education and Hospitals, to which this portion of the supplementary report of the Board of Trustees was referred, will be found in the reference committee report following the report of the Council on Medical Education and Hospitals on the same subject on page 1687.

Resolution on Distribution of Medical Care: In accordance with the directive of the House of Delegates at its meeting in June 1951, the Board of Trustees referred to the Committee to Study the Twelve Point Program the resolution on distribution of medical care introduced by Dr. William F. Costello of New Jersey. The committee submitted the following report, which is being transmitted to the House of Delegates with the approval of the Board of Trustees:

The Committee to Study the Twelve Point Program met in New York City on Oct. 27, 1951, for the purpose of holding a hearing on the New Jersey resolution, at which representatives from the medical societies of New Jersey, New York and North Carolina were present.

The committee was impressed by the energy and devotion with which the New Jersey society had been attempting to solve some of the difficult problems of medical care. After much discussion of the several proposals contained in the resolution, the fields of disagreement were mentioned, i. e.: (a) That the American Medical Association limit its support to the non-profit medical service plans; (b) that the government, at every level, should promote a program of medical care protection for its own employees by assuming a part or all of the cost of enrolment in voluntary non-profit payment plans; (c) that consideration be given to providing an overall inclusive service for non-chronic conditions and with no income limitations; (d) that the government should purchase policies in non-profit medical service agencies for the care of the medically indigent not on relief rolls; (e) that the possibility of securing the assignment of U. S. Public Health Service physicians in sparsely settled areas or to other areas not properly served by physicians be explored; (f) that the American Medical Association support a program of government subsidy where needed to assist qualified individuals in obtaining professional training, and to expand professional training facilities either by addition to existing schools or the establishment of new schools.

The Committee to Study the Twelve Point Program finds itself unable, therefore, to endorse the New Jersey proposals as now written and recommends that amended proposals be submitted by the New Jersey delegates to the House of Delegates of the American Medical Association for future consideration and action by the House of Delegates.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Raymond M. McKeown, Chairman, presented the following report, which was adopted:

The supplementary report of the Board of Trustees dealing with the cooperative studies now in process between the Medical Society of New Jersey and the special cooperating study committee established by the Trustees goes far to reaffirm our confidence in cooperative effort. The committee established by the Board of Trustees to study the Twelve Point Program presented by New Jersey reported itself unable to endorse the New Jersey proposals as now written and recommended that amended proposals as approved by the New Jersey house of delegates be submitted to the House of Delegates of the American Medical Association in the future for consideration and action. The subject was ably presented by Dr. Hamilton of the Board of Trustees as well as Dr. W. F. Costello of New Jersey.

Your committee, after due consideration, approves the supplementary report of the Board of Trustees dealing with the New Jersey proposals with corrections as requested.

Poisonous Household Products: In view of the fact that infants and small children may suffer serious injury or death from accidental ingestion of such commonly used household articles as carbon tetrachloride dry cleaning fluid, methyl salicylate (oil of wintergreen) and silver polishes containing cyanide, all of which, though poisonous, are not labeled as such, and that new cleaning products and other household preparations are being placed on the market each year, some of which may be poisonous and yet not be so labeled because they do not fall under the Federal Caustic Poisons Act, the Board of Trustees is planning to take appropriate steps to warn the public, and parents of young children in particular, of the dangerous nature of household products known to be poisonous but not so labeled, by publishing such information in *Today's Health* and in other publications and pamphlets of the Association and to conduct a survey of deaths of small children and infants resulting from ingestion of household products not labeled as poisonous. The Board of Trustees reports this matter to the House of Delegates and requests the concurrence of the House in the development of this project.

Report of Reference Committee on Hygiene and Public Health

Dr. Charles L. Farrell, Chairman, presented the following report, which was adopted:

Your reference committee strongly endorses the supplementary report of the Board of Trustees on Poisonous Household Products and recommends concurrence.

Relation of Physicians and Hospitals: After exhaustive study and careful consideration of the several reports previously rendered relative to the relation of physicians and hospitals, the Board is submitting for consideration of the House of Delegates a substitute report, as follows:

Relation of Physicians and Hospitals

On June 9, 1949 the House of Delegates approved a Report of the Committee on Hospitals and the Practice of Medicine as revised by the reference committee; in December, 1949 the House by motion reaffirmed the principles of such report but re-referred it to the original committee for revision; in June, 1950 the House of Delegates approved, as amended by the reference committee, the further report of the Committee on Hospitals and the Practice of Medicine and in December, 1950 an Addendum to such report recommended by the Judicial Council.

The Board of Trustees has had these reports under study for the past year and is of the opinion that they need clarification. Accordingly, the Board of Trustees recommends that there be substituted for all those reports referred to in the first paragraph hereof the following statement to be known as:

GUIDES FOR CONDUCT OF PHYSICIANS IN RELATIONSHIPS WITH INSTITUTIONS

So far as it can be determined on the basis of study made by the Bureau of Legal Medicine and Legislation of the American Medical Association, as a matter of law the corporate practice of medicine is illegal in most states. In almost all instances the classic example given by the courts of the type of corporate practice of a profession that is illegal is the instance in which a corporation hires a professional man and then sells his services to the public on a fee basis for the profit of the corporation. Such exceptions as there are refer to statutory legislation in several states permitting certain modifications of this general law. It must also be remembered that fee splitting with a corporation is just as unethical as fee splitting with another physician.

In addition to being guided by the laws of the various states, physicians in their relationships with hospitals must be guided by the Principles of Medical Ethics of the American Medical Association. Those sections of the Principles which have a distinct bearing on these relationships are as follows:

> Chapter I, Sec. 3. "Groups and Clinics.—The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual physicians, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession."
>
> Chapter III. Article VI. Sec. 2. "Conditions of Medical Practice.—A physician should not dispose of his service under conditions that make it impossible to render adequate service to his patients, except under circumstances in which the patients concerned might be deprived of immediately necessary care."
>
> Chapter III. Article VI. Sec. 3. "Contract Practice.—Contract practice as applied to medicine means the practice of medicine under an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, whereby partial or full medical services are provided for a group or class of individuals on the basis of a fee schedule, or for a salary or for a fixed rate per capita.
>
> "Contract practice *per se* is not unethical. Contract practice is unethical if it permits of features or conditions that are declared unethical in these Principles of Medical Ethics or if the contract or any of its provisions causes deterioration of the quality of the medical services rendered."
>
> Chapter III. Article VI. Sec. 6. "Purveyal of Medical Service.—A physician should not dispose of his professional attainments or services to any hospital, lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit exploitation of the services of the physician for the financial profit of t agency concerned. Such a procedure is beneath the dignity of profession practice and is harmful alike to the profession of medicine and the w fare of the people."
>
> In conclusion, the Principles of Medical Ethics states: "These princip of medical ethics have been and are set down primarily for the good the public and should be observed in such a manner as shall merit a receive the endorsement of the community . . ."

The duties of the Judicial Council are specified in the Con tution and By-Laws and among those duties the following prescribed:

> "The Council shall have jurisdiction on all questions of medical et and the interpretation of the laws of the Association.
>
> "The Council at its discretion may investigate general professional c ditions and all matters pertaining to the relations of physicians to another and to the public, and may make such recommendations to House of Delegates or the constituent associations as it deems necess
>
> "The Council shall have authority to request the President to app investigating juries to which it may refer complaints or evidence of ethical conduct which in its judgment are of greater than local conc Such investigating juries, if probable cause for action be shown, s submit formal charges to the President, who shall appoint a prosec to prosecute such charges against the accused before the Judicial Cou in the name and on behalf of the American Medical Association. Council may acquit, admonish, suspend or expel the accused."

The primary obligation of both physicians and hospitals i serve the best interest of the patients. The decision as to ethical or unethical nature of practice must be based on the mate effect for good or ill on the public as a whole. All of various questions involved in the relationship between physici and hospitals, both legal and ethical, particularly questi dependent on local conditions, must be considered in the instance at the local level because of the various differer which of necessity exist in the many sections of the country.

One of the factors that have aggravated physician-hosp relationship is the inclusion of medical services in the contr of voluntary hospital service plans. The medical professio fostering voluntary health insurance, and we believe that noth should be done to disturb this very important and essential gram. However, the American Medical Association has r firmed many times through its then Bureau of Medical E nomics, its Judicial Council and the House of Delegates principle that hospital service plans should exclude all med services, and the contract provisions of such plans should limited exclusively to hospital services. At the same time, that there would be no misunderstanding as to which servi should or should not be included, the House of Delegates stated that ". . . if hospital service is limited to include o hospital room accommodations, such as bed, board, operat room, medicine, surgical dressings and general nursing care, distinction between hospital service and medical service will clear." (Proceedings of the San Francisco Session of the Ho of Delegates, 1938, p. 31.) Past actions of the House of D gates give every reason to reiterate that radiology, anesthesiolo pathology and physiatry constitute the practice of medicine.

In order to initiate a method for remedying this situation, i recommended that Blue Shield and Blue Cross be requested cooperate to the extent of writing all new contracts in suc manner that Blue Shield will cover insurable medical servi and Blue Cross will cover insurable hospital services. It is ho that the professional and hospital authorities and the volunt prepayment plans will cooperate in furthering these reco mendations.

Since the physician and hospital are interdependent, it is cumbent on both to be interested in all phases of their scient and financial relationships. This means that the professional s of the hospital has very definite responsibilities toward not o other members of the professional staff, whether active or co tesy, but also toward hospital management. The recommen tions of the staff concerning medical matters are usually accep by the management of the hospital through its board of ma agers or trustees. It must also be remembered that to be approv for residencies in specialties by the American Medical Assoc tion and the American College of Surgeons, certain requireme are mandatory to the institution, among them adequate path logic and radiologic coverage. As a rule, the staff of a hospi elects an executive committee or works under an appoint executive committee to advise the lay officers of the instituti on purely professional matters, and recommends who may

may not use the institution for professional work. Unfortunately, in many instances, the financial problems of the lay hospital management have been no affair of the staff or of its professional executive committee. This is wrong and probably the cause of most of the differences of opinion between physicians and hospital management. The financial problems of an institution in which a physician does his professional work are definitely of importance to him and to the professional staff, and the proper consideration must be given to these problems if the hospital is to work efficiently and remain the workshop of the physician, and without proper facilities the services rendered to the public are in jeopardy and these public services are the all-important function of both hospital and staff.

Every professional man on the appointed staff should have a voice in the professional management of the institution. The pathologist, roentgenologist, anesthesiologist and physiatrist, as well as the other professional staff members, should have equal standing as active members of the staff with all the rights and privileges pertaining to other members of the staff of equal standing. The chiefs of these departments should be nominated and appointed in the same manner as are the chiefs of other major departments in the same hospital.

The revised Principles of Medical Ethics has been written with all of these various factors in mind and is broad enough to cover all possible ethical physician-hospital relationships. The Constitution and By-Laws of the American Medical Association distinctly covers methods of procedure for all persons who have a complaint so that they may approach the Judicial Council. The functions of that Council are specifically delineated.

> "In the event of a controversy between physician and physician, or physician and hospital management, on these problems, it is recommended that, since local conditions must be taken into consideration, these problems be resolved insofar as possible at the local level.
>
> "There can be no exploitation of the doctor or of the hospital if everyone concerned in management and on the professional staff will work together to supply the greatest possible good quality medical and hospital services to the public. In any given controversy, every effort should first be made to settle the matter at the staff-management level. In case of failure to settle the controversy at this level, assistance of the county medical society should be requested. If, then, it cannot be resolved it should be submitted to a committee of the state medical association for advice and recommendation. If problems cannot be solved at the staff-management level, through the county medical society, or through the state medical association, the Constitution and By-Laws of the American Medical Association provides that ". . . the (Judicial) Council, at its discretion, may investigate general professional conditions and all matters pertaining to the relations of physicians to one another and to the public, and may make such recommendations to the House of Delegates or the constituent associations as it deems necessary."

To implement the settlement of such controversies, it is recommended that each component medical society and each constituent state and territorial medical association appoint a Committee on Hospital and Professional Relations. This committee should be available to receive complaints from any physician, hospital, medical organization, or any other interested person or group with reference to professional or economic relations existing between doctors of medicine and hospitals. On receipt of such complaint by such a committee the matter should be investigated and acted on in such manner as will best effect adjustment of the complaint.

Another approach that should not be neglected in activating this report is that of the local and state hospital associations. Most of the states and many communities have hospital associations providing direct representation for the hospitals within their areas. It seems reasonable to assume that state medical associations and component county medical societies could well effect liaison with these organizations in the settlement of problems involving physician relationships.

In summary, the following general principles are suggested to individual physicians, county medical societies, and state medical associations as a basis for adjusting controversies, these principles, however, to be qualified to the extent required by the applicability of one or more of the factors heretofore mentioned:

1. A physician should not dispose of his professional attainments or services to any hospital, corporation or lay body by whatever name called or however organized under terms or conditions which permit the sale of the services of that physician by such agency for a fee.

2. Where a hospital is not selling the services of a physician, the financial arrangement if any between the hospital and the physician properly may be placed on any mutually satisfactory basis. This refers to the remuneration of a physician for teaching or research or charitable services or the like. Corporations or other lay bodies properly may provide such services and employ or otherwise engage doctors for those purposes.

3. The practice of anesthesiology, pathology, physical medicine and radiology are an integral part of the practice of medicine in the same category as the practice of surgery, internal medicine or any other designated field of medicine.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. Joseph D. McCarthy, Chairman, presented the following report, which was adopted:

The report of the Hess Committee has been before the House of Delegates, the Board of Trustees and the Council on Medical Service from time to time. It is the hope of your reference committee that finally the American Medical Association has a draft which will be acceptable to all concerned. Your committee recognizes that all the members of the House have not had the opportunity to read the Board of Trustees' revised report inasmuch as up to this morning it was not available. This report should be read in toto because of its import. Only in this way will the members of the House have full knowledge of its contents, important to each of you, yes, but much more important that all be able to pass along to their confreres the exact intent.

In the opinion of your committee, the members of the American Medical Association, medical schools, the American Hospital Association, the hospital boards controlling hospital directives now have a code of principles which should be a guiding light for physician-hospital relations. After all, amicable relationships of this character can be settled at the local level in the great majority of instances. Should this be impossible, physicians do have channels up to the Judicial Council of the American Medical Association through which the disagreement may be funneled. Modes of procedure so cited are forgotten and thereby too often the issue is forgotten or lost by default.

For your information there were no objections to the adoption of this pronouncement by members of the American Medical Association attending the reference committee hearing.

Your committee unanimously approves this revised pronouncement of the Board of Trustees, suggests that the principles in the future be referred to as "Relation of Physicians and Hospitals" and that the House of Delegates commend the Board for its arduous study and constructive recommendations relative to the revised "Code."

Funds for Medical Research: Surveys of the sources of money for medical research which have been conducted to date have given only a partial picture of the funds available, have concentrated primarily on governmental grants and have ignored, for the most part, contributions of free time by scientists and gifts of private individuals. Many scientists are alarmed at the lack of funds for free research, that is, funds for scientific research not connected with any particular disease such as cancer, multiple sclerosis and so forth. This lack needs to be pointed up if it indeed exists. Data uncovered by a comprehensive survey of all time and money being given for medical research would provide valuable guidance to philanthropic institutions and individuals in the most useful giving of funds for medical research.

In view of these facts, the Board of Trustees through its Committee on Research plans to conduct a preliminary survey of (1) the sources of funds, both public and private, now available for medical research; (2) the amount of free time being donated to medical research, and (3) the fields of medical research receiving funds and in what proportion.

The Board reports this matter to the House of Delegates and requests concurrence in this project.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Warren W. Furey, Chairman, presented the following report, which was adopted:

Your committee heartily concurs in the recommendation of the Board of Trustees relative to this matter and recommends its approval.

survey of deaths of small children and infants resulting from ingestion of household products not labeled as poisonous. The Board of Trustees reports this matter to the House of Delegates and requests the concurrence of the House in the development of this project.

REPORT OF REFERENCE COMMITTEE ON HYGIENE AND PUBLIC HEALTH

Dr. Charles L. Farrell, Chairman, presented the following report, which was adopted:

Your reference committee strongly endorses the supplementary report of the Board of Trustees on Poisonous Household Products and recommends concurrence.

Relation of Physicians and Hospitals: After exhaustive study and careful consideration of the several reports previously rendered relative to the relation of physicians and hospitals, the Board is submitting for consideration of the House of Delegates a substitute report, as follows:

RELATION OF PHYSICIANS AND HOSPITALS

On June 9, 1949 the House of Delegates approved a Report of the Committee on Hospitals and the Practice of Medicine as revised by the reference committee; in December, 1949 the House by motion reaffirmed the principles of such report but re-referred it to the original committee for revision; in June, 1950 the House of Delegates approved, as amended by the reference committee, the further report of the Committee on Hospitals and the Practice of Medicine and in December, 1950 an Addendum to such report recommended by the Judicial Council.

The Board of Trustees has had these reports under study for the past year and is of the opinion that they need clarification. Accordingly, the Board of Trustees recommends that there be substituted for all those reports referred to in the first paragraph hereof the following statement to be known as:

GUIDES FOR CONDUCT OF PHYSICIANS IN RELATIONSHIPS WITH INSTITUTIONS

So far as it can be determined on the basis of study made by the Bureau of Legal Medicine and Legislation of the American Medical Association, as a matter of law the corporate practice of medicine is illegal in most states. In almost all instances the classic example given by the courts of the type of corporate practice of a profession that is illegal is the instance in which a corporation hires a professional man and then sells his services to the public on a fee basis for the profit of the corporation. Such exceptions as there are refer to statutory legislation in several states permitting certain modifications of this general law. It must also be remembered that fee splitting with a corporation is just as unethical as fee splitting with another physician.

In addition to being guided by the laws of the various states, physicians in their relationships with hospitals must be guided by the Principles of Medical Ethics of the American Medical Association. Those sections of the Principles which have a distinct bearing on these relationships are as follows:

> Chapter I, Sec. 3. "Groups and Clinics.—The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual physicians, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession."
>
> Chapter III. Article VI. Sec. 2. "Conditions of Medical Practice.—A physician should not dispose of his service under conditions that make it impossible to render adequate service to his patients, except under circumstances in which the patients concerned might be deprived of immediately necessary care."
>
> Chapter III. Article VI. Sec. 3. "Contract Practice.—Contract practice as applied to medicine means the practice of medicine under an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, whereby partial or full medical services are provided for a group or class of individuals on the basis of a fee schedule, or for a salary or for a fixed rate per capita.
>
> "Contract practice *per se* is not unethical. Contract practice is unethical if it permits of features or conditions that are declared unethical in these Principles of Medical Ethics or if the contract or any of its provisions causes deterioration of the quality of the medical services rendered."
>
> Chapter III. Article VI. Sec. 6. "Purveyal of Medical Service.—A physician should not dispose of his professional attainments or services to any hospital, lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit exploitation of the services of the physician for the financial profit of the agency concerned. Such a procedure is beneath the dignity of professional practice and is harmful alike to the profession of medicine and the welfare of the people."
>
> In conclusion, the Principles of Medical Ethics states: "These principles of medical ethics have been and are set down primarily for the good of the public and should be observed in such a manner as shall merit and receive the endorsement of the community . . ."

The duties of the Judicial Council are specified in the Constitution and By-Laws and among those duties the following is prescribed:

> "The Council shall have jurisdiction on all questions of medical ethics and the interpretation of the laws of the Association.
>
> "The Council at its discretion may investigate general professional conditions and all matters pertaining to the relations of physicians to one another and to the public, and may make such recommendations to the House of Delegates or the constituent associations as it deems necessary.
>
> "The Council shall have authority to request the President to appoint investigating juries to which it may refer complaints or evidence of unethical conduct which in its judgment are of greater than local concern. Such investigating juries, if probable cause for action be shown, shall submit formal charges to the President, who shall appoint a prosecutor to prosecute such charges against the accused before the Judicial Council in the name and on behalf of the American Medical Association. The Council may acquit, admonish, suspend or expel the accused."

The primary obligation of both physicians and hospitals is to serve the best interest of the patients. The decision as to the ethical or unethical nature of practice must be based on the ultimate effect for good or ill on the public as a whole. All of the various questions involved in the relationship between physicians and hospitals, both legal and ethical, particularly questions dependent on local conditions, must be considered in the first instance at the local level because of the various differences which of necessity exist in the many sections of the country.

One of the factors that have aggravated physician-hospital relationship is the inclusion of medical services in the contracts of voluntary hospital service plans. The medical profession is fostering voluntary health insurance, and we believe that nothing should be done to disturb this very important and essential program. However, the American Medical Association has reaffirmed many times through its then Bureau of Medical Economics, its Judicial Council and the House of Delegates the principle that hospital service plans should exclude all medical services, and the contract provisions of such plans should be limited exclusively to hospital services. At the same time, so that there would be no misunderstanding as to which services should or should not be included, the House of Delegates has stated that ". . . if hospital service is limited to include only hospital room accommodations, such as bed, board, operating room, medicine, surgical dressings and general nursing care, the distinction between hospital service and medical service will be clear." (Proceedings of the San Francisco Session of the House of Delegates, 1938, p. 31.) Past actions of the House of Delegates give every reason to reiterate that radiology, anesthesiology, pathology and physiatry constitute the practice of medicine.

In order to initiate a method for remedying this situation, it is recommended that Blue Shield and Blue Cross be requested to cooperate to the extent of writing all new contracts in such a manner that Blue Shield will cover insurable medical services and Blue Cross will cover insurable hospital services. It is hoped that the professional and hospital authorities and the voluntary prepayment plans will cooperate in furthering these recommendations.

Since the physician and hospital are interdependent, it is incumbent on both to be interested in all phases of their scientific and financial relationships. This means that the professional staff of the hospital has very definite responsibilities toward not only other members of the professional staff, whether active or courtesy, but also toward hospital management. The recommendations of the staff concerning medical matters are usually accepted by the management of the hospital through its board of managers or trustees. It must also be remembered that to be approved for residencies in specialties by the American Medical Association and the American College of Surgeons, certain requirements are mandatory to the institution, among them adequate pathologic and radiologic coverage. As a rule, the staff of a hospital elects an executive committee or works under an appointed executive committee to advise the lay officers of the institution on purely professional matters, and recommends who may or questioned the right of physicians to deduct entertainment ex- nses for income tax purposes, contending that such expenditures are unethical. The Council is informed that the deducti- ility of similar expenditures has been permitted where the payer is a lawyer. The Council knows of no reason why a fferent ruling should apply when the taxpayer is a physician. The Council expresses no opinion with respect to the legal pects of the question but does wish to recall to the attention the House of Delegates a statement that was published in e Journal for Feb. 3, 1951, beginning on page 323, which s prepared by the Bureau of Legal Medicine and Legislation d dealt with the physician's Federal income tax. In that state- nt appears references to instances in which the deductibility expenses incurred for entertainment purposes has been per- tted when such expenses were incurred by an actor and by a yer. The Bureau of Legal Medicine and Legislation is receiv- an increasing number of inquiries from physicians whose ductions of entertainment expenses have been questioned. This rifying statement by the Council may be of much help to se physicians.

DEPENDENCE OF PHYSICIANS ON EACH OTHER

Sections 1 and 2 of Article II, Chapter III of the Principles Medical Ethics, entitled Professional Services of Physicians to ch Other, read as follows:

> Dependence of Physicians on Each Other. Section 1.—As a general , a physician should not attempt to treat members of his family or self. Consequently, a physician should cheerfully and without recom- se give his professional services to physicians or their dependents if are in his vicinity.
>
> Compensation for Expenses. Sec. 2.—When a physician from a dis- e is called to advise another physician about his own illness or about of one of his family dependents, and the physician to whom the ice is rendered is in easy financial circumstances, a compensation that at least meet the traveling expenses of the visiting physician should proffered him. When such a service requires an absence from the stomed field of professional work of the visitor that might reasonably xpected to entail a pecuniary loss, such loss may, in part at least, be ided for in the compensation offered."

f a physician or his dependents have insurance providing bene- for medical or surgical care, then in the opinion of the Ju- al Council a physician who renders such service may accept insurance benefits without violating the provisions of Chap- III, Article II, Sections 1 and 2 of the Principles of Medical ics above quoted.

APPEAL PROCEDURE

he Council would like to emphasize the details of the pro- ure to be followed in effecting appeals authorized under apter X, Section 4 (I) of the By-Laws. This emphasis is ught to be advisable at this time in order that delays in con- ration of appeal cases be reduced to a minimum. The atten- of members is redirected to the fact that in considering cases perly appealable, the Council may consider only questions law and procedure, not of fact. Before the Council may as- e jurisdiction of a case, evidence must be submitted that the rieved member has exhausted all procedures available to him ler the provisions of the constitutions and by-laws of the com- ent and constituent associations of which he is a member. effecting an appeal, the aggrieved member must file with the airman of the Council six copies of an appeal statement, or ef, setting forth clearly the basis advanced by the member as reason why the Council should assume jurisdiction and take ion. A copy of this statement or brief must be forwarded at same time to the appropriate officer of the constituent asso- tion from the decision of which the appeal is taken. The pres- By-Laws provide that an appeal can be taken at any time thin six months "immediately following the date of decision the constituted authority of a constituent association." The uncil feels that it would serve to expedite appeal procedure the By-Laws were amended to require that the appeal be ected within a period of sixty days rather than six months. e Council also feels that justice will be better served if, on an peal being perfected, the decision of the constituent association re stayed pending the final decision of the Council. The Coun- hopes to have published in The Journal in an early issue a tailed statement relative to procedures to be followed in ap- als to the Council.

DR. JOHN H. O'SHEA

It is again our sad duty to report the death of a former member of the Council. Dr. John H. O'Shea of Spokane, Wash., was elected to the Judicial Council in 1933 and served continuously until 1948 when he suffered a cerebral accident. Until his illness he was constant in his attendance at our meetings. Realizing that he would never be able to resume his active work, he resigned from the Council in 1949. Dr. O'Shea was always intensely interested in the work of the Council and faithful in discharging all of his duties. His long service gave him a valuable insight into the principles of ethics, the laws of our Association and its many traditions. He was a man of substance, fine character and high ideals. Dr. O'Shea brought to the deliberations of the Council an atmosphere of the forward characteristics of the great northwest section of our country. He was charitable in his judgment but never compromised with willful wrong-doing. In his long service he contributed greatly to the work of the Council and in his passing our members feel a great sense of personal loss.

Respectfully submitted,

Edward R. Cunniffe, Chairman.
H. L. Pearson Jr.
J. B. Lukins.
Louis A. Buie.
Walter F. Donaldson.

Report of Reference Committee on Miscellaneous Business

Dr. Warren W. Furey, Chairman, presented the following report, which was adopted:

Your reference committee notes with approval the accomplishments of the Judicial Council and commends its members for their effort. The report was discussed and considered favorably. Your reference committee recommends approval of the sections of the report entitled Entertainment Expenses and Dependence of Physicians on Each Other. Your committee concurs in the recommendations of the Judicial Council with reference to Appeal Procedure and further recommends that this portion of the report be referred to the Committee on Constitution and By-Laws for implementation. Your reference commmittee notes with extreme satisfaction the dignified memorial to Dr. John H. O'Shea and heartily concurs in the sentiments expressed. It recommends approval.

The Vice Speaker stated that, in accordance with the recommendation of the reference committee, the portion of the report of the Judicial Council dealing with Appeal Procedure was referred to the standing Committee on Constitution and By-Laws.

Report and Supplementary Report of Council on Medical Education and Hospitals

Dr. H. G. Weiskotten, Chairman, presented the report of the Council on Medical Education and Hospitals (see The Journal, Nov. 24, 1951, pages 1273-1278) and a mimeographed supplementary report which dealt exclusively with the Revised Essentials of an Acceptable Medical School. (Because of limitation of available space, the supplementary report is not submitted herewith; copies will be ready for distribution within a short time.) The report and supplementary report of the Council were referred to the Reference Committee on Medical Education and Hospitals.

Report of Reference Committee on Medical Education and Hospitals

Dr. Joseph D. McCarthy, Chairman, submitted the following report, which was adopted section by section and as a whole, as amended:

Accreditation of Hospitals: A portion of the report of the Board of Trustees was assigned to your reference committee, it having to do with a report on the Joint Commission for the Accreditation of Hospitals. In order that this subject may be considered in toto by the House of Delegates at this time, your committee will combine the Board's recommendations along with that portion of the report of the Council on Medical Education and Hospitals entitled "Hospital Standardization" and a portion of the supplementary report of the Board of Trustees.

Coordinating Committee: Dr. Elmer L. Henderson, Chairman of the Coordinating Committee for the National Education Campaign, submitted a report from his Committee to the Board of Trustees on December 3. This report was approved by the Board of Trustees and Dr. Henderson has been requested to present it to the House of Delegates.

The Board of Trustees voted to continue for another year the present Coordinating Committee, with the addition of Dr. John W. Cline, President of the American Medical Association, as a member.

The report of the Reference Committee on Legislation and Public Relations on this portion of the supplementary report of the Board of Trustees will be found following the Report of the Coordinating Committee on page 1693.

Resolution on Free Choice of Physicians for Federal Employees: With reference to the Resolution on Free Choice of Physicians for Federal Employees, which was adopted by the House of Delegates in June, 1949, the Board of Trustees wishes to report that several meetings have been held between Dr. J. Stanley Kenney of New York, who introduced the resolution, and representatives of the Association's Council on Industrial Health and of the New York Employees' Compensation Commission. After much discussion, it was agreed by all those who participated in the conferences that to press for the principle involved, by the approach mentioned in the resolution, would be unwise, and it was recommended that no action be taken at this time for the accomplishment of the resolution.

Resolutions on Publicizing American Medicine: In accordance with the Resolutions on Publicizing American Medicine, introduced by Dr. Edward P. Flood of New York in June 1951, the Department of Public Relations, to which the resolutions were referred, has prepared 26 slogans which are available to physicians for use in advertising space purchased in journals, annuals and programs of educational, welfare, religious and eleemosynary groups. The headquarters office will be glad to supply these slogans on request.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. R. B. Robins, Chairman, presented the following report, which was adopted:

Resolutions on Publicizing American Medicine: Your reference committee approves these resolutions and recommends their adoption.

Resolution on Costs of all Technical and Professional Training: In Atlantic City in June 1951 Dr. E. F. Hoffman of California presented a resolution relative to the amortization for federal income tax purposes of the costs of all technical and professional training. This resolution was submitted to the Bureau of Legal Medicine and Legislation and the Council on Medical Education and Hospitals, and the attached memorandum has been furnished the Board of Trustees by the Director of the Bureau of Legal Medicine and Legislation. It is submitted to the House of Delegates for such consideration as it may think necessary in the premises.

There was referred for comment to the Council on Medical Education and Hospitals and to the Bureau of Legal Medicine and Legislation by the Executive Committee of the Board of Trustees a resolution presented to the House of Delegates at the Atlantic City, 1951, meeting by Dr. E. F. Hoffman of California relative to the amortization for federal income tax purposes of "*the costs of all technical and professional training.*" The resolution calls attention to the fact that business concerns may annually depreciate capital assets for income tax purposes and purposes in effect that the cost of professional education received by physicians and others *in a like category be considered a capital asset* to be amortized for tax purposes.

Only one question was submitted to the Council and to the Bureau for comment, namely, "whether the establishment for tax purposes, of the costs of all technical and professional training is practical and whether such information will be available." The Bureau has no information on which to base an answer to this question but the Council, through its Secretary, Dr. Anderson, feels that it would not be too difficult to establish the costs of a medical education at least by recent graduates. Tuition costs could readily be determined as well as the costs of books and equipment. The cost of housing and meals could likewise be determined but there may be some question as to whether expenditures of this sort would be taken into consideration in determining the total amount to be amortized. The same question may also be raised with respect to traveling expenses incurred in attending school. The major portion of the costs of a medical education, however, may be ascertained without too much difficulty.

Quite aside from the question of the determination of costs, there
other aspects of the matter that should be considered. In order to jus
support of the proposal embodied in the resolution, its benefits wo
have to be limited to those taxpayers who themselves paid for th
medical education. It would seem rather indefensible to suggest tha
taxpayer be permitted to amortize for tax purposes the costs of a medi
education when someone else paid for that education, such as the fa
of the taxpayer. Furthermore, business concerns are permitted to de
ciate capital assets to offset deterioration and obsolescence. It will
somewhat difficult to draw an analogy between that procedure and the
proposed in the resolution, for even though a medical education
deteriorate it would be impossible to fix any rate of depreciation or
evaluate it in terms of money.

The House of Delegates is already committed to the proposition that
costs of postgraduate study should be *deductible* for federal income
purposes and an application has been filed with the Office of the C
missioner of Internal Revenue as an initial step to effectuate the H
action. This application is based, in part, on the contention that
expenses are incurred to keep up to date a physician's "stock-in-tra
or, in other words, to prevent deterioration. It would seem to be in
sistent to argue that the cost of medical education should be amort
on the hypothesis that such education is a capital asset and at the s
time contend that the expenses of postgraduate education are an *ordi*
and necessary business expense and not costs in obtaining a capital a
The two positions would be somewhat difficult to harmonize.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOU BUSINESS

Dr. Warren W. Furey, Chairman, presented the following
port, which was adopted:

The Resolution on the Costs of all Technical and Professio
Training, originally introduced in Atlantic City in June 1951,
submitted to the Bureau of Legal Medicine and Legislation
the Council on Medical Education and Hospitals. The statem
was made that the accomplishment of the resolution was
practical and unobtainable. The report by the Bureau of L
Medicine and Legislation was approved by your reference c
mitteee, and it recommends approval of the report.

Report of the Judicial Council

Dr. Edward R. Cunniffe, Chairman, presented the follow
report of the Judicial Council, which was referred by the Spea
to the Reference Committee on Miscellaneous Business:

To the Members of the House of Delegates of the Ameri
Medical Association:

This report covers the work done by the Judicial Cou
since the midwinter meeting, which was held in conjunction w
the House of Delegates session in Cleveland in December 19
There was a subsequent meeting held on April 19, 1951 an
third held in conjunction with the annual session of the Ho
of Delegates in Atlantic City in June. At that session a sh
report was made on matters referred from the meeting held
previous December in Cleveland. There were two meetings
the Judicial Council at that time. The fourth meeting of
Council was held in Chicago on Oct. 9, 1951. At these meeti
the usual routine business was transacted which consisted
an examination of those applying for Fellowship whose el
bility was questioned, the recommendation of candidates
Affiliate Fellowship, and the consideration of many requests
decisions and opinions concerning the ethics of practices wh
were either already followed or were contemplated by
writers. A great majority of these queries were answered by
Chairman, who expressed his personal opinion with the assura
that the decision of the entire Council would be forthcomi
At the fifth meeting, held in Los Angeles on December 2,
Council heard an appeal from the decision of a constituent st
medical association. A second meeting, on December 3, was c
cerned entirely with routine business such as outlined abo

ENTERTAINMENT EXPENSES

The Judicial Council has been asked to express its opini
with respect to the ethical aspects of expenditures made
physicians for the entertainment of other physicians. The Cou
cil does not consider such expenditures as *per se* unethical. The
are circumstances under which a professional obligation m
rest on a physician to entertain other physicians. It is a usu
and necessary concomitant of the practice of medicine. It is ce
tainly not an uncommon practice and is recognized by the pr
fession generally as entirely proper and justifiable.

The opinion of the Council was requested on this matter b
cause governmental tax authorities in several jurisdictions ha

Graduate Training: The great amount of work covered in the continuation study of graduate training programs may be attested to by the fact that from October 1, 1950 to September 30, 1951, the Council's field representatives visited 574 hospitals for the purpose of reviewing and evaluating 238 internship programs and 1,437 residency programs. The Council's program envisages that every hospital approved for internship and residency training will be inspected at least once every two years.

The supply and distribution of interns has proven to be a difficult problem for solution. Your reference committee would point out that for many years the House of Delegates has received resolutions having to do with this subject. A special committee was appointed by the House of Delegates under the chairmanship of Dr. William Bates of Pennsylvania to study the many ramifications incident to this matter and presented a report to the House of Delegates in 1949. This report has been most helpful to the Council.

A Resolution on Approval of Internships from the Oregon State Medical Society was received by the House at this session. This, along with many other similar resolutions, the report of Dr. Bates' Committee and the material now in the hands of the Council will be turned over to a committee recently appointed by the Board of Trustees and known as the Advisory Committee on Internships. This committee held its first meeting in September 1951, at which time the overall subject was reviewed. Plans are now in process for the future development of the study, the results of which will not be forthcoming for at least another year because of the tremendous amount of detail.

It is interesting to note that the number of hospitals approved for residency training has increased from 1,071 in 1950 to 1,120 in 1951, and that residency programs in general practice increased from 32 in 1950 to 66 in 1951, an increase of 34.

In the Council's report it is pointed out that the Council has worked in close collaboration with the American Board of Internal Medicine and the American College of Physicians for the purpose of evaluating approved residency programs in internal medicine. This study has been aided to a considerable degree by a contribution of $1,500 from the American College of Physicians and another of $1,000 from the American Board of Internal Medicine. These two organizations are to be commended for their direct support and interest.

Technical Schools: Your committee has been impressed with the work being done by the Council on Medical Education and Hospitals in collaboration with the Council on Physical Medicine and Rehabilitation relating to the personnel, training facilities, standards and curricula of technical schools. This study in the mind of your committee has been long overlooked, and it is good to know that these studies will be continued. It is appreciated by all concerned that those who would choose this vocation should not be hampered by the demand that they hold a college degree. Definite principles for the guidance of those conducting technical schools will be forthcoming in the near future.

Collaboration with Other Agencies: It is noteworthy that the Council on Medical Education and Hospitals is increasing its efforts to collaborate with other agencies interested in the many phases of medical education. This endeavor has become one of the most significant parts of the Council's program in terms of time, energy and importance.

Annual Congress on Medical Education and Licensure: Your committee would like to call the attention of the House of Delegates to the fact that on February 11 and 12, 1952, the Congress on Medical Education and Licensure will meet in Chicago. This meeting is one from which stems constructive information which in turn has been applied to the betterment of medical education and the licensing of physicians. Your committee suggests that those interested in these subjects attend these sessions.

The remainder of the report of the Council on Medical Education and Hospitals is purely informative.

Supplementary Report of the Council on Medical Education and Hospitals: This supplementary report points out that during the past year the Council has been engaged in a periodic revision of its "Essentials of an Acceptable Medical School." This work has been completed and the Council requests that the House of Delegates adopt these Essentials. The "Essentials of an Acceptable Medical School" was first approved by the House of Delegates of the American Medical Association in 1910, since which time 8 revisions have been made. Copies of this report have been distributed to the members of the House of Delegates. Your committee has given considerable study to its contents. Your committee, suggests that the third paragraph of section "III Faculty" be edited to read:

"Reasonable security of tenure must be assured in order that the personnel of the faculty may have adequate stability. Salaries of full time members of the faculty should be sufficient to enable them to support themselves and their families without the necessity of diverting time and energy to other occupations."

Your committee would also like to call attention to the statement made in section "X Curriculum," which is as follows: "No rigid curriculum for accomplishing these objectives can be prescribed." To this your committee heartily subscribes.

Your committee would like to commend the Council on Medical Education and Hospitals for the work completed in furthering improvements in medical education and hospital standardization. The Council has done a tremendous amount of work and in the opinion of your committee has done an admirable job.

Report and Supplementary Report of Council on Scientific Assembly

Dr. Henry R. Viets, Chairman, presented the report of the Council on Scientific Assembly (see THE JOURNAL, Nov. 24, 1951, pages 1278-1279) and the following supplementary report, both of which were referred by the Speaker to the Reference Committee on Sections and Section Work:

The Council on Scientific Assembly met with the section secretaries on October 16, 1951 in Chicago. Another meeting of the Council was held on December 3 in Los Angeles. This supplementary report deals with the principal business transacted at these meetings.

1952 ANNUAL SESSION

The request from the Smith, Kline and French Laboratories for permission to televise at the Chicago Annual Session was granted. The time schedule for the General Scientific Meetings and the section meetings was revised and will be put into effect at the Chicago Session. The General Scientific Meetings wil be held all day on Monday and on Friday morning. The sections will meet both mornings and afternoons, on Tuesday, Wednesday and Thursday. It is hoped that this arrangement will obviate the difficulties encountered for many years by sections meeting on Friday afternoon, after the closing of the Scientific Exhibit at noon. The programs of both the General Scientific Meetings and the section meetings are well developed at the present time with speakers of national importance on timely topics of interest to the medical profession in general.

1952 CLINICAL SESSION

The general plan adopted, but not used, for the Clinical Session that was to have been held in Denver in 1950 will again be put into effect at the session to be held in the same city in December 1952. The Council has already conferred with Dr. William B. Condon, Chairman of the Local Committee on Arrangements, in regard to the program and will meet with his committee in April 1952, in Denver, to consider the program in detail.

1953 ANNUAL SESSION

The Council has considered the preliminary plans for the New York Annual Session in 1953. As that year will mark the 300th anniversary of the founding of New York City and a Tercentenary Celebration is planned by the city, the Council would suggest that an historical presentation, by exhibit and lectures, of three hundred years of New York medicine might be made a feature of the meeting.

Respectfully submitted,

HENRY R. VIETS, Chairman.
STANLEY P. REIMANN.
ALPHONSE MCMAHON.
CHARLES H. PHIFER.
CARL A. LINCKE.
MICHAEL E. DEBAKEY.
SAMUEL P. NEWMAN.

Organizational plans which will set this Commission in motion have been completed, the commission to convene in Chicago on Dec. 15, 1951 for its first meeting. The Commission will be made up of 18 members, six representing the American Medical Association, six the American Hospital Association and three each from the American College of Physicians and the American College of Surgeons. Those on the Commission representing the American Medical Association are: Drs. Gunnar Gundersen and Stanley Truman for terms of three years; Drs. Dwight A. Murray and Herman G. Weiskotten for terms of two years, and Drs. Rolland Whitacre and Julian P. Price for terms of one year. These members of the Commission representing the American Medical Association are truly representative of the administrative, general practice and specialty departments of the American Medical Association and, because of their qualifications, it is hard to conceive that their efforts will not be crowned with success.

Your committee visualizes the wide scope of the problems which will be placed before this body. For instance, the questions besetting hospital accreditation along with kindred problems will be but a beginning. Your committee is in entire accord with the ideas relating to the purpose of the Commission, with the apportionment of members from the respective representative organizations who will make up the Commission and with the organizational plans.

Financial Support of Medical Education and Report of the American Medical Education Foundation: Again your committee has taken the liberty of combining two reports in the belief that it will make for better correlation. The gist of the comments to be found in the first portion of this report will be found in the report of the Council under the heading "Financial Support of Medical Education," and in the report of the American Medical Education Foundation.

Considerable discussion was devoted to this subject. It was pointed out that there are many focal points through which contributions of physicians for financial support of medical education are channeled. These agencies are on local, state and national levels. Many physicians have contributed to one or more of these agencies; some earmark their contribution for a particular medical school. It is suggested that the names of donors with the amount contributed be relayed by these agencies to the Foundation so that all contributions may be acknowledged. If this is done, it will be shown that the number of physicians contributing to this cause will be greatly increased over those making direct donations to the fund. If this is done, it will be most helpful in attracting the attention of many within and outside the allied professions to the fact that the physicians of the United States are not only backing the movement vocally but with their hard cash as well, which may in turn prompt them to forward their contributions to the fund.

Projecting the aims of the Foundation into the future, the plans for the distribution of the fund to medical schools annually shape up as follows: (a) Equally divided grants between the respective medical schools (present plan); as the fund grows (b) per capita grants based on enrolment at the respective medical schools, and (c) special grants where special needs are designated. In the future all contributions earmarked for a particular medical school will be turned over to that school along with its proportionate share of the general fund.

There should be set up in the constituent medical associations committees which would try to obtain contributions from all of their members. Your committee commends and agrees with the suggestions contained in the extemporaneous remarks on this subject delivered by Dr. Elmer L. Henderson to the House of Delegates on Tuesday, December 4.

In the report of the Council on Medical Education and Hospitals the following statement occurs: "The gap between unmet needs and available funds has been narrowed to a point where if the National Fund for Medical Education and the American Medical Education Foundation can provide an annual fund of from five to ten million dollars, the gap that remains for many schools will be all but eliminated." With this in mind, it should be a stimulus to all of us not only to give but to give more than we have given in the past.

For clarification it should be pointed out that the National Fund has been conceived as an agency to raise funds on a wholesale basis from organized groups, whereas the Foundation is designed to raise funds specifically from the medical professio The two agencies work in close relationship, this being attest to by the fact that members of the Board of Directors of t Foundation serve on the Advisory Council of the Fund.

Your committee is of the opinion that this project shou have the sympathy and encouragement of every member of t medical profession, to the end that all physicians contribu liberally each year to the fund.

On the matter of contributions by doctors to the Americ Medical Education Foundation the attention of the House called to the fact that the revision of the By-Laws which p vides that Fellowship status will be discontinued means a l to the American Medical Association of approximately $350,0 This money could well be used by the American Medical E cation Foundation. It is recommended that the Board of Trust explore the feasibility of reactivating the Fellowship status recognition of those doctors who annually contribute, as l erally as they can, to the American Medical Education Foun tion.

Brochures with subscription blanks have been distributed the Convention Hall during this Clinical Session and th should be made available to every county medical society this country so that local committees may utilize them in effo to obtain subscriptions to the fund.

Report of the Council on Medical Education and Hospit There were three resolutions referred to the Council on Me cal Education and Hospitals during the annual 1951 session h in Atlantic City. The first had to do with the multiplicity medical meetings with particular reference to the requirem of attendance at hospital staff meetings; the second recommen that at least eight of the 24 months' general practice residen be devoted to surgery four of which would embrace operat room experience, and the third recommended that the Cou set up standards of qualifications for physicians who wo apply radium in hospitals. These resolutions have had the c sideration of the Council. The Council recommends that resolutions, because of their complexities, be referred to newly appointed Joint Commission on Accreditation of Hospit for further study. Your reference committee is in agreem with this plan.

Medical Education and National Defense: Your commit would remind the House of Delegates that the Council has e barked on a plan which will maintain "a flow of well trai physicians adequate to meet the needs of both the armed fo and the civilian economy during partial or complete mobili tion."

Survey of Medical Education: The Survey of Medical Edu tion by the Committee on the Survey of Medical Educat under the sponsorship of the Council on Medical Education a Hospitals and the Association of American Medical Coll has been in progress for the past two years. It has entaile tremendous amount of work which is still unfinished. The fore, it will not be possible to publish the complete report pr to the spring of 1952. It might be pointed out that the S committee on Preprofessional Education of the Survey of Me cal Education has made an intensive study during the past y of preprofessional education. The committee has visited appro mately 100 colleges and universities offering such educatio opportunities. A detailed report of this study will be forthco ing in the near future. Your committee would also like to po out that detailed information has been obtained by the Coun on Medical Education and Hospitals from 19 medical scho offering preceptorships, a report on this study appearing in t 1951 Educational Number of THE JOURNAL. The *Committee* the Survey of Medical Education is also investigating precept ships and will present its findings in its final report.

Foreign Medical Schools: The Council, collaborating w the Association of American Medical Colleges, has made a tailed study of foreign medical schools for the purpose of eval ating their curricula. It is interesting to note that the origin list of 38 schools published in February 1950 has been panded to 49 with the recommendation that their graduates given consideration when applying for licensure on the sa basis as graduates of approved medical schools in the Unit States. This list of acceptable foreign medical schools is of valuable aid to licensure boards throughout the United Stat

Your reference committee appreciates the great amount of work done and the time spent in preparing the Amendments to the Constitution and By-Laws, and desires to commend the standing committee for thorough and efficient performance of an arduous task. Your reference committee approves all of the amendments and recommendations presented by the standing committee in Sections B and D of its report, which are herewith presented in detail:

AMENDMENTS TO THE CONSTITUTION

1. Article 6, Section 2: This matter was held over, under the rule, from the June 1951 session at Atlantic City, being an amendment to the Constitution, and is, in reality, a composite of several resolutions introduced at that time. Its effect is to add to the membership of the House of Delegates the Assistant Secretary of the American Medical Association and two delegates elected by the Student American Medical Association as ex officio members without vote, and to give the five immediate Past Presidents of this Association voting membership.

The standing Committee on Constitution and By-Laws has recommended that "that portion of the amendment which provides that five immediate Past Presidents of the American Medical Association shall be voting members of the House of Delegates" be rejected. The standing committee believes that, "so far as possible, the voting power of the House of Delegates should be limited to elected delegates; the committee recognizes the propriety of delegate representation from the Armed Forces and the Veterans Administration but believes that extension of such voting power to non-elected representatives is unwise." Your reference committee concurs in this recommendation, and points out that at present all Past Presidents are members of the House without vote. The amended section would then read: "Sec. 2.—The House of Delegates is composed of delegates elected by the constituent associations and by the sections of the Scientific Assembly and of delegates from the Medical Departments of the United States Army, the United States Navy, the United States Air Force, the United States Public Health Service and the Veterans Administration, appointed by the Surgeon-General or Chief Medical Director, as the case may be, of the respective service. The general officers, the Past Presidents of the Association, the General Manager, the Assistant Secretary, the Editor of The Journal of the American Medical Association, the chairmen of the several Councils and two delegates elected by the Student American Medical Association shall be ex officio members of the House of Delegates without the right to vote."

2. Article 6, Section 3 of the Constitution: Add the words "of the American Medical Association" after the words "active members" in the third line of this Section, so that this sentence will read: "Sec. 3.—The number of delegates from the constituent associations shall be proportional to the number of active members of the American Medical Association in the respective associations as provided in the By-Laws." This is an obvious clarification, and your committee recommends its adoption.

These are the only amendments to the Constitution on which your committee has had to take any action. The balance of this report deals with amendments to the By-Laws.

AMENDMENTS TO THE BY-LAWS

3. Chapter II, Section 2.—Dues. In the first line of this Section, insert the words "for active members" after "annual dues." Seventh line, insert the word "membership" before the word "dues" at the beginning of the sentence, and at the end of this sentence add, after the word "Association," the following: "unless a Member requests another scientific journal published by the American Medical Association in lieu of The Journal of the American Medical Association." Change the fourth sentence of this Section to read: "The Board of Trustees may excuse the following members from payment of dues, provided they are fully or partially excused from the payment of local dues by their component and constituent associations:"

Amend subsection (D) of this Section to read: "A Member temporarily in the Armed Forces. Dues will be remitted from January 1 or July 1 following the date of the Member's entrance into military service, regardless of local dues exemption."

Amend subsection (E) to read: "Members may be excused, on request, from the payment of American Medical Association dues, regardless of local dues exemptions, on January 1 following their 70th birthday."

Amend the last paragraph of this Section by substituting the date "June 1" for the date "December 31" in the second line. This sets the deadline for delinquency. This amendment was recommended by the Board of Trustees for administrative reasons, since the present delinquency date, "December 31 of the year for which dues are prescribed," is so late that the membership list for one year cannot be determined until the next ensuing year.

4. Chapter III.—Disciplinary Action. In the third sentence, delete the words "the House of Delegates on the recommendation of" and the word "and" following the words "Judicial Council" and add after the phrase "expel any member" the phrase "of the American Medical Association." Delete, also, the last sentence of this Chapter, which begins "The hearing . . ." Chapter III will then read: "In all controversies between a Member and his component society or constituent association, an appeal may be made to the Judicial Council on questions of law and procedure only, but not of fact. The appeal shall be perfected within six months following the date of decision by the constituted authority of the constituent association in question. In addition to such disciplinary action as may be taken under the constitution and by-laws of the component society and constituent association to which the Member belongs, the Judicial Council, after due notice and hearing, may censure, suspend or expel any Member of the American Medical Association for an infraction of the Constitution or these By-Laws or for a violation of the Principles of Medical Ethics."

These changes are suggested because, in its present form, the wording conflicts with the duties of the Judicial Council as outlined in Chapter X.

5. Chapter IV, Section 2, (A) (2) Service Fellows. About the middle of this Section, after the words "Veterans Administration," add the words "and the Indian Service," and in the eighth line delete the word "its" and substitute the words "their respective," and add an "s" to the word "Director" in the following line, so that the first sentence of this subsection will read: "(2) Service Fellows.—On approval of the Judicial Council, commissioned medical officers of the United States Army, the United States Navy, the United States Air Force or the United States Public Health Service, who have been nominated by the Surgeon General of the respective services, and the permanent medical officers of the Veterans Administration and the Indian Service, who have been nominated by their respective Chief Medical Directors, may become Service Fellows." Note that this refers to Fellows. This will be changed, along with the balance of the By-Laws, when amendments are adopted to provide for a single membership classification.

6. Chapter IX, Section 1 (A). Delete from the last two lines the phrase "session of the House in which he is to serve" and substitute therefor the phrase "date on which he is to assume office." This is to obviate an awkward situation that might theoretically arise, as a Delegate actually is in office on January 1 of the year for which he is elected, although a session is not ordinarily held until June.

7. Chapter IX, Section 1 (B). Delete the end of the first sentence after the word "appointment." This clause is now obsolete.

8. Chapter IX, Section 3 (C) (2). Change the word "attachés" to the phrase "members of the staff."

9. Chapter X, Section 1 (A). Add after the words "Standing Committees" the word "Councils" in parentheses.

Chapter X, Section 4. Add the word "Councils" in parentheses after the title "Standing Committees." In subhead (5) of this Section, change the word "Committee" to "Council."

10. Chapter X, Section 4 (B).—Change the letter (B) to (A) and delete the final clause of the first sentence of the second paragraph, beginning "except that . . .", so that the sentence will end at the word "expires." This clause is now obsolete.

In the last sentence of this paragraph delete the words "the Secretary of the Association and the Editor of The Journal," since these officials are already members of all standing committees as provided in another section of the By-Laws, and substitute the phrase "an ex officio member" for the present phrase "ex officio members.".

11. Chapter X, Section 4 (B). In the sixth line of the fourth paragraph insert after "Board of Trustees" the phrase "selected by the Board," and after the word "Council" in the next line add the phrase "except that the President and the Trustee member shall be ex officio members without vote."

Report of Reference Committee on Sections and Section Work

Dr. T. C. Terrell, Chairman, presented the following report, which was *adopted:*

Your reference committee studied the report of the Council on Scientific Assembly as well as the supplementary report of that Council. The committee wishes to recommend that the Council on Scientific Assembly proceed with its plans for a suitable program embodying the tercentennial celebration of New York during the 1953 Annual Session in New York City. Your committee accepted both the report of the Council on Scientific Assembly and its supplementary report, and wishes to commend the Council in its present policy of trial variations in the routine meeting dates of the general and section meetings during the annual sessions.

Report and Supplementary Report of Council on Medical Service

Dr. James R. McVay, Chairman, presented the report of the Council on Medical Service (see The Journal, Nov. 24, 1951, pages 1279-1281) and the following abstract of a supplementary report, mimeographed copies of which were distributed among the members of the House of Delegates. (The complete supplementary report will appear in the Official Proceedings of the House of Delegates, which is published separately.) The report and supplementary report of the Council were referred to the Reference Committee on Insurance and Medical Service.

ABSTRACT OF SUPPLEMENTARY REPORT

As a standing committee of the House of Delegates the Council on Medical Service reports at each session, both annual and clinical.

At this time I should like to invite your attention to a montage depicting the four pilot "You and Your A. M. A." programs. Mention is made in the Board of Trustees report concerning the success and future of these programs.

I should also like to submit to the House of Delegates an laboration of the section of the Council's report having to do with the Physician Placement Service activities. At the annual session in June 1951 the House approved four recommendations for expanding the Association's activities in the placement field. The Council has followed through on these recommendations and, through its Committee on Extension of Hospitals and Other Facilities, has taken steps to carry out these recommendations. At this time I shall not read the details in regard to our suggestions but copies are available to members of the House.

Memorial To Dr. A. W. Adson

This report would not be complete without a word of appreciation of the services of Dr. A. W. Adson, who was stricken while attending the North Central Conference in Minneapolis and died the following day, November 12, 1951. In addition to his outstanding scientific attainments, he gave unstintingly of his time and energy to perpetuate and further the high standards of the medical profession.

Dr. Adson was a leader in the creation of the Council on Medical Service in 1943 and served on the Council from its origin until 1948. Part of that time he was its Vice Chairman and more recently served as chairman of the Council's Committee on Prepayment Hospital and Medical Service. He will be missed by all members of the Council, by the members of the House of Delegates and by his many friends throughout the country who have had the privilege of his counsel and friendship.

Respectfully submitted,

James R. McVay, Chairman.
Elmer Hess, Vice Chairman.
Jesse D. Hamer.
Joseph D. McCarthy.
Thomas A. McGoldrick.
H. B. Mulholland.
John W. Cline.
E. L. Henderson.
David B. Allman.
Mr. Thomas A. Hendricks, Secretary.

Report of Reference Committee on Insurance and Medical Service

The material from the Council on Medical Service was considered under the several headings given in its report.

The subject of Voluntary Health Insurance as presented in the published report, as well as in the Suggested Amended Statement, subsequently added by the Council and included in its supplementary report, is approved by your committee without additional change or correction. The subject of Federal Medica Services is presented by the Council. Your committee approve of the presentation.

The subject of Physicians Placement Service, as well as a supplementary report received by your committee from the Counci on Medical Service, ably discusses the problem of physicia placement. Your committee compliments the Council on th thoroughness with which this important subject was investigate and approves of the report as presented.

On the subject of Maternal and Child Care, your committe approves of this as presented but wishes to reaffirm further th committee's firm belief in private care through a private insu ance carrier where possible. It holds that ample private faciliti exist or could readily be provided, without federal interferenc for maternal and child care.

The Care of the Indigent is a fundamental, crucial proble that must be solved. Your committee congratulates the Counc on Medical Service for its work on this all important proble and approves of its efforts to date.

Your committee further wishes to compliment the Council o Medical Service on its efforts to develop liaison with other o ganizations. It is through a united effort that progress is being a will be made towards the goal of improved medical care.

Your committee studied with deep interest the Loan Kits us by the Council on Medical Service in its various present tions over the country on its general topic of "You and Yo A. M. A." We believe such presentations should be encourag and expanded as opportunity affords so that all members of t medical profession the country over may know and understan the organization and workings of the American Medical Ass ciation.

Report of Committee on Constitution and By-Laws

Dr. Louis A. Buie, Chairman, presented a 23 page report the standing Committee on Constitution and By-Laws, whic was divided into four sections: A, B, C and D. Section A had do exclusively with amendments to the Constitution and t By-Laws so as to establish the single membership classificati which was recommended by the House of Delegates at t annual session in June 1951. The Speaker declared that the would be no referral of Section A of the report, since the amen ments included therein must lie over for final action until t next session of the House. Section B presented for final actio amendments to the Constitution submitted at the June 1951 se sion. Section C included amendments to the Constitution, exclusive of those under Section A, presented for the first tim at this session of the House of Delegates, which must lie ove until the June 1952 session. Section D presented amendmen to the By-Laws which could be acted on at this session, and recommendation that the Resolution on Emeritus and Retire Membership introduced at the 1951 annual session be n adopted.

The Speaker referred Sections B and D of the report to th Reference Committee on Amendments to the Constitution an By-Laws, declaring that Section C, as well as Section A, mus lie over, without referral at this session, until the June 195 session.

Report of Reference Committee on Amendments to the Constitution and By-Laws

This report covers Sections B and D of the report of the standing Committee on Constitution and By-Laws. These sections o the report were referred by the Speaker. Sections A and C o the report must, under our regulations, lie over for action unti the next session of this House of Delegates.

and its constituent medical associations. We must maintain the interest and the friendly cooperation of the many thousands of organizations whose support we have won in our campaign against regimentation. But the election year ahead is perhaps the most critical year of the medical profession's existence as a free society, dedicated to the health of a nation, unhampered by politics. Before this time next year, the die will be cast as to who will be responsible for the health of Americans in the future, whether medical men or politicians of socialistic persuasion. The character and caliber of the men elected to Congress next year and to the high administrative offices of our Nation will determine that vital issue. With the same sincerity of purpose which has guided medicine in its crusade against socialization, we believe that the doctors of America, exercising their rights as individual citizens, are determined to help decide the outcome of the fundamental question as to whether this Nation shall surrender to socialism, or shall remain a free nation, dedicated to the principle of human liberty.

It is apparent that Americans expect such help and such leadership in their home communities from doctors who have led the three year crusade to turn the edge of socialism. During the months ahead, this committee intends to urge doctors to exercise their precious privileges as alert and responsible citizens. Every doctor will be meticulously advised that his medical society, as an incorporated organization must not participate in election activities. But every doctor will be as carefully advised as to what he may do legally as an individual citizen who cares about the course of his country to help determine that course. We intend to urge doctors, as independent individuals, to study the background and the beliefs of every candidate for public office, irrespective of party labels or partisan considerations. We intend, frankly, to urge doctors, as good citizens, to support and encourage the public service of men and women of high moral integrity, who know the values of individual responsibility and who advocate and practice the precepts of Americanism, not socialism nor any other foreign-born ism.

As you know, Whitaker and Baxter have been retained on a half time, counselling basis to direct this work.

This we believe to be the only appropriate culmination to the work of preserving the freedom of the medical profession and, at this crucial time in American affairs, we believe this to be the greatest contribution we can make to our country.

In the annals of our profession and as future generations judge us, we believe that it shall always stand to the honor of this House of Delegates and as a tribute to the practicing physicians of this era that when we faced up to the issue of state socialism, we had the courage to resist appeasement and to refuse to compromise either our medical principles or our belief in the basic principles of American freedom.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. R. B. Robins, Chairman, presented the following report, which was adopted:

Report of the Coordinating Committee and the Supplementary Report of the Board of Trustees Regarding the Coordinating Committee: Your committee approves of this report and recommends its adoption. Again we express our appreciation of the splendid report submitted.

Report of American Medical Education Foundation

Dr. Elmer L. Henderson, President, presented the report of the American Medical Education Foundation (see THE JOURNAL, Nov. 24, 1951, pages 1281-1282) and the following extemporaneous supplementary report, which were referred to the Reference Committee on Medical Education and Hospitals:

At the interim session last December in Cleveland, the Board of Trustees of the American Medical Association made a contribution of a half million dollars to medical education. Shortly after that time, the American Medical Education Foundation was formed. We had as a nucleus at that time the half million dollars contributed by the Board of Trustees of the American Medical Association and a few thousand dollars contributed by the officers of the Association and members of this House of Delegates. At the same time and on the day that the original contribution was announced, Medical Economics contributed $5,000 in cash and $5,000 in advertising space.

We had hoped that the early part of this year we would be able to report at least a million dollars contributed by the medical profession of this country, but we have been far from our million dollars even up to this time. In addition to the half million dollars contributed by the American Medical Association, up to Nov. 23, 1951, $265,401.85 has been contributed. From November 23 to November 28, $1,371 was contributed. You will note that that is far below our million dollar goal for this year.

Among the contributions, there were 37 donations from lay people, 1,361 from individual doctors out of our membership of approximately 140,000. The organizations which contributed numbered 25. I am happy to say that when I came in this room this morning I was stopped by Dr. Henry S. Ruth and notified of a contribution of $2,500 from the American Society of Anesthesiologists. There have been a number of contributions from organizations that I have announced previously before this House of Delegates. For instance, in June I announced a contribution of $10,000 from the Woman's Auxiliary to the American Medical Association, which was certainly a very liberal contribution from a group that has such limited funds. Since that time several other organizations have contributed. There have been some state medical societies that have contributed. Among such contributions, the greatest from any state society was $102,955 contributed by the members from California. That is by far the largest contribution that we have received from any state organization or from the various doctors of any state. It ranges from that down to nothing. There are three states in the Union where there has not been a single doctor who has contributed to this fund.

Since it was brought to the attention of the officers and the Board of Trustees that a few had neglected to contribute, every one of them has contributed. But there are a very large number of members of this House of Delegates who have not contributed, and I hope before we leave this meeting we shall have a contribution from every member of the House. We have got to prove to the folks in Washington who are trying to regiment us that we are in earnest, that we are determined to support medical education. If the Federal Government ever takes control of medical education, it is not going to be long until they will have full control of the medical profession, and the only way that we can defeat that is to support medical education.

The National Fund for Medical Education, headed by the Hon. Herbert Hoover as Honorary President, has done a great deal toward raising funds and at this time is making more progress than ever. We joined with them in July, at which time we furnished $640,882.90, and a distribution was made to every four year medical school in this country of $15,000, and to every two year school of $7,500. That was the initial contribution from the combined two groups. We had hoped by the first of next year to make another distribution, but our funds have been coming in very slowly recently. However, we are encouraged, due to the fact that we have been notified by quite a number of state medical societies that committees have been formed to solicit funds from the members, and some have notified us that they have quite a little money on hand, which we hope to receive before the end of the year. But, gentlemen, I hope that each and every one of you will take this matter seriously and not only donate to this fund yourself but also go back home and see that committees are formed and see that more support is given this movement. It is imperative that we do not fall down on this movement for collection of funds for medical education.

The report of the Reference Committee on Medical Education and Hospitals on the above report will be found in the report of the reference committee following the report of the Council on Medical Education and Hospitals on page 1688.

At the beginning of the next paragraph substitute the word "Council" for the words "Standing Committee." Delete the entire second sentence of this paragraph beginning with the words "At the 1951 Annual Session. . . ." This sentence is now obsolete. In the tenth line of this paragraph add after the words "Board of Trustees" the phrase "selected by the Board," and change the word "committee" in the next to the last line of the paragraph to "Council."

12. Chapter X, Section 4 (F). Delete the word "subcommittees" in the second line, replacing it with the words "special committees."

In the same Section 4, subsection (H), in place of the phrase "a report," in the second line, substitute the phrase "an annual report" and add a new sentence at the end of this paragraph, as follows: "Only urgent special reports shall be submitted at the annual session."

Reletter the subsections "C" to "I" inclusive, in Section 4, each respectively with the preceding letter of the alphabet.

13. Chapter X, Section 4 (I) (5). Substitute for the phrase "standing committee" the word "Council."

14. Chapter XII, Section 1 (B). Substitute for the phrase "Scientific Assembly" the phrase "annual session."

15. Chapter XII, Section 1 (C). Delete the words "and of the Board of Trustees" at the end of the paragraph. This is provided for in Chapter XIII under "Composition of the Board of Trustees."

16. Chapter XII, Section 2 (A). Delete the words "and the Board of Trustees" at the end of this paragraph (A).

17. Chapter XIII, Section 1. In the fifth line of this Section add the words "the Assistant Secretary" before the words "the Treasurer," and add in the same sentence of the same Section, after the words "the Editor of The Journal," the words "and others at the invitation of the Board."

18. Chapter XIV, Section 1. Change the words "Scientific Assembly" in the third line of this Section to the words "Annual Session."

A Resolution on Emeritus and Retired Membership introduced at the June 1951 session of the House of Delegates was referred to the standing Committee on Constitution and By-Laws for consideration. The standing committee recommends that the resolution be not adopted, in view of the fact that the present Constitution and By-Laws provides for Associate Membership in the American Medical Association for those members of constituent associations who are not eligible for active membership, and for exemption from dues of those active members who are over the age of seventy or are retired from practice. In the opinion of the standing committee, therefore, the present Constitution and By-Laws already provides categories of Membership similar to emeritus and retired membership. Your reference committee concurs in this opinion and recommends that the resolution be not adopted.

On motions duly made, seconded and carried, after discussion, the proposed amendments to the Constitution and to the By-Laws were adopted, as was the report of the reference committee section by section and as a whole.

Introduction of Delegates from Student American Medical Association

The Speaker introduced to the House of Delegates the delegates of the Student American Medical Association, Mr. James Allen Henderson of the University of Oregon and Mr. David Buchanan of the University of Illinois.

Report of Coordinating Committee

Dr. Elmer L. Henderson, Chairman, presented the following report of the Coordinating Committee, which was referred to the Reference Committee on Legislation and Public Relations:

Mr. Speaker, Members of the House of Delegates:

Three years ago, on Dec. 1, 1948, in a momentous session at St. Louis, which should long be remembered by every doctor who values his right to practice in freedom, this House of Delegates adopted a Statement of Policy which may well be called American Medicine's Declaration of Independence. It was a ringing declaration of belief in medical responsibility and in voluntary action, as opposed to compulsion, in meeting the problem of providing prepaid medical care for the American people. It was a forthright declaration, too, that American medicine would fight to defend and maintain its freedom. We were in great difficulty when that Statement of Policy was adopted, with the serious threat hanging over us that a nationwide system of socialized medicine would be enacted before we could even mobilize our forces and inaugurate the National Education Campaign which the House of Delegates had authorized. This committee, which had been directed to organize and supervise the national campaign of public education, met and worked for months in a continuous state of emergency and there were many who told us that we had started too late, that we should have bowed to the inevitable and sought a compomise with those in the Government who were determined to take over control of medical practice.

On this third anniversary of medicine's Declaration of Independence, it is important that we make realistic appraisal o what we have achieved in order to be very sure of where w stand today and what should be our course for the future.

In the prosecution of our campaign, medicine has accomplished all of the objectives we set ourselves at the outset, and more. The destructive legislation designed to create a Government-directed system of compulsory health insurance wa stopped well within our time limit. Constructive programs i scores of fields have been set in motion or emphatically strengthened. A strong, new measure of public approval and friendl understanding has been earned for our profession by reaso of the fact that doctors carried their case directly to the America people. All the many objectives attained, the methods used t accomplish the work and the costs involved have been reporte in detail at each meeting of this House during the three yea period, in order that all members would be closely advised of th campaign's vicissitudes, its triumphs and its progress towar ultimate success.

Perhaps the most significant figures which could be cited i this report are the most recent compilations of the number o Americans who are protected today under Voluntary Healt Insurance. These figures furnish the most conclusive proof o medicine's conviction that "the voluntary way is the America way." The latest figures disclose that in the three years since ou nationwide campaign of education was launched, there hav been 25,000,000 additional enrolments in the Voluntary Healt Insurance plans of the country, and that today approximatel 77,000,000 people in the United States have some form of prepaid health protection. The American people are thus demonstrating in splendid fashion that they believe, with us, in Voluntary Health Insurance as opposed to compulsory Governmen dominated plans.

The only other figures important to record here today concern our campaign finances. As you will recall, our first year' campaign, which encompassed the first nationwide distributio of informative material, cost approximately $1,500,000. In th second year, when our program included the very successf national advertising campaign, our expenditures totaled ju under $2,500,000. This year we were able to reduce our expend tures to about $500,000. For the coming year's work, due to th progress which has been made, we have been able to cut ou budget to less than a quarter of a million dollars.

The work of the Campaign Coordinating Committee in th year ahead will be of a somewhat different order from that o the past. We must, of course, continue to be alert and ready fo any threats of compulsory health insurance or other legislatio designed to regiment the medical profession. Our campaign organization must be geared to combat such proposals and to win

As the members of this House of Delegates are aware, th present national administration is expected to make a vigorou renewal of its demand for compulsory health insurance legislation in the first month of the coming session of Congress. I should also be noted that Gov. Earl Warren of California, a declared candidate for the Republican nomination for President recently has renewed his agitation for compulsory health insurance. There is no partisanship in American medicine's approach to this problem and every doctor should be advised that Gov. Warren's record on this issue, is just as destructive to medical freedom as that of the present national administration.

We must, of course, do all in our power to support and encourage the broad program for improved medical care and service, which is being guided by the American Medical Association

Red Cross Special Study Committee: The committee is in receipt of a communication from Mr. James C. Nicholson, Executive Vice President of the American National Red Cross, to the effect that on November 19 the Board of Governors of the Red Cross saw a "need for an analytical and objective study of the policies, plans and procedures of the program at the national and local levels, together with the program's relationship to the resources and other responsibilities of the Red Cross." The Board of Governors therefore authorized the president of he Red Cross to "appoint a committee, whose membership shall nclude representatives of the Board of Governors, the Committee on Medical Policies and Procedures, and the chapters (the resident to designate the Chairman). The Committee's duties hall be to study the blood program for the purpose of determining the effectiveness of present policies, plans and proedures at the national and local levels in light of present and oreseeable future commitments, and to make such recommenations as may seem appropriate. The Committee shall make s report to the President for such consideration as he may etermine to be desirable by the Board of Governors."

We are not advised as to the names of the members of this ommittee. We offer the full cooperation of the American Medial Association Committee on Blood Banks. The recommendaons of this special committee could go far toward the limination of some of our recurring problems.

Armed Forces Blood Donor Program: Developing considerble concern at the exhaustion of its World War II reserve of ried plasma, the Department of Defense on August 2 issued directive from which the following is quoted:

"3. Accordingly, the Department of Defense will begin immediately;

"a. A continuous and vigorous campaign, in conjunction with the Red ross, to persuade the civilian and military population to contribute whole ood to the Armed Forces.

"b. To establish an Armed Forces blood donor program within the amework of the overall campaign, the primary purpose of which shall to obtain blood from service personnel on military bases within the ntinental United States. Civilian employees will be invited to particiate.

"4. The Red Cross has agreed to coordinate the collection of blood, imarily from the civilian population, through its existing facilities, operating blood banks, and additional Defense Centers established by the d Cross with the Department of Defense funds. Full cooperation by echelons of the three Services is urged in convincing the civilian pulation and military personnel of the vital military necessity of suprting this program.

"5. The responsibility for promotion, publicity and public information this campaign, plus any free or paid advertising, is assigned for direcn and programming to the Directorate of Public Information, Office the Secretary of Defense. It is desired that both headquarters and field blic information offices of the Services lend their full and wholearted support.

"6. The Armed Forces blood donor portion of the overall program ll be under the policy guidance of the Armed Forces Medical Policy ouncil, Office of the Secretary of Defense. Responsibility for general rection and control of this military portion of the overall program, its mprehensive coordination, integration of shipping schedules and quotas laboratories, necessary reporting procedures, and technical guidance, is signed to the Directorate of the Armed Services Medical Procurement gency, Main Navy Building, Washington 25, D. C., to which all local med Forces blood donor programs must be submitted for approval ior to actual collection of blood in order to avoid waste. Existing edical facilities and personnel should be used to the greatest possible tent. In addition, when practicable and within reasonable geographical oximity, the Armed Forces blood donor program should be coordinated th the local Red Cross facilities or cooperating blood banks. The gency and nature of this program require direct communication, which ould be authorized. Necessary funds will be made available by the irectorate from the Department of Defense Blood and Blood Derivatives und. It is understood that blood collected in connection with the Armed orces blood donor program becomes government property and will be ipped to designated facilities as prescribed."

A clarifying memorandum issued on Oct. 9, 1951, within the epartment of Defense and signed by W. Randolph Lovelace I, M.D., Chairman, Armed Forces Medical Policy Council, ontained the following:

"2. The following policies on civilian participation in this program are rnished for your information and guidance:

"a. Civilians living in areas adjacent to a military reservation on which blood donor center has been established may donate blood to the Armed orces Blood Donor Program at the military center on the same basis s civilian employees of the installation, provided no other facilities exist n the area for this purpose or pending their development.

"b. It is not considered desirable from a policy standpoint for blood onor facilities under the auspices of the military departments to be stablished outside military reservations.

"c. Contractual arrangements with independent blood banks or other civilian groups for the collection of blood in connection with the Armed Forces Blood Donor Program should not be undertaken by the Blood Group, Armed Services Medical Procurement Agency, or any other military agency. Where such arrangements are considered desirable, the cooperation of the American Red Cross should be requested in accordance with existing agreements."

Initially, the use of the term "Armed Forces Blood Donor Program" led to some public confusion as to its location in the overall program, but a perusal of the quotations above from the Department of Defense directives should eliminate any such confusion.

In the thirty days following the directive of August 2, the Department of Defense, with the assistance of a publicity expert employed for the purpose, organized a nationwide publicity campaign employing all media for the development of a public consciousness of responsibility for blood donation. Great credit is due to the wholehearted cooperation and assistance of all segment of the press, radio and entertainment world as well as that of public-spirited organizations of all kinds. At the time of the beginning of armistice negotiations in Korea, blood collections, which had been on the increase, began to diminish. The response to the publicity program has been great. The most difficult part of this task now lies ahead since the nation is under the necessity of maintaining a continuing high level of donations month after month, year in and year out, for a minimum of three years, even without the outbreak of widespread hostilities or the occurrence of a great emergency within our borders as a result of enemy action.

The American Medical Association has the responsibility of assisting in the maintenance of the balance of the program between military, civil defense and civilian needs, and physicians must accept the role of serving continuously as propagandists for maintenance of blood donations for all of these purposes in all parts of the country. Donated blood must and should be routed in one of four directions: (1) As whole blood for the Armed Services; (2) To plasma processing laboratories to build up plasma reserves for the Department of Defense; (3) To plasma processing laboratories for civil defense, and (4) For continuing daily usage for civilian needs. The need in each of these four directions is pressing and continuous planning and revision of plans will be necessary throughout the program.

As recommended by the American Medical Association in June 1951, physicians and their families should lead the way as blood donors; some medical societies have already promoted this effectively.

Federal Civil Defense Administration: Some of the relatively small funds which have become available to the Federal Civil Defense Administration may be expended for plasma reserves as well as for very important reserves of equipment requisite for large scale bleeding in the event of local disaster. The special technical manual "Civil Defense Blood and Blood Derivatives Program" probably will be published in December and will become generally available. The American Medical Association again urges on all those in authority, both in planning bodies and appropriating bodies, that full consideration be given to all the known needs of the populace in regard to civil defense.

Health Resources Advisory Committee: Under the Office of Defense Mobilization there has been created a Health Resources Advisory Committee, of which Dr. Howard Rusk of New York is chairman. This committee has set up a subcommittee on blood, and your committee is furnishing assistance to both of these committees.

The Office of Defense Mobilization has a large responsibility in respect to the balance in our economy regarding both the needs of the civilian population and of the national defense, including civil defense. This office, headed by Mr. Charles E. Wilson, has responsibilities which are very great and possesses considerable authority under the President of the United States. The programs it plans are of far-reaching significance; in respect to the blood program it has been the duty, as well as the desire, of this committee to offer the maximum assistance which the American Medical Association can render. It is probable that any planning of the Office of Defense Mobilization in this field will be announced at a reasonably early date. It is our belief that such planning could potentially lead to an early solution of many of the problems which have proved vexing.

Other Recommendations: (1) Conservation of Blood: The committee believes that whole blood should be used whenever and wherever there are positive medical indications for its use, and that due consideration should be given, also, to the contraindications to its employment and to the well known hazards resulting from the use of whole blood. Likewise, physicians should study the indications in which the use of blood fractions would be as good as or even superior to the administration of whole blood fractions, such as plasma, irradiated or dried, packed red cells, resuspended red cells and serum albumen. A physician's obligation to his patient demands the avoidance of the abuse of blood and blood products. From the overall standpoint, the use of blood fractions where indicated will increase the utility of a pint of blood. As more and more laboratories are equipped to fractionate blood it will be less necessary to resort to commercially separated fractions. It is recommended that THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, in the discretion of the Editor, publish suitable articles relating to the indications and contra-indications for the use of blood and blood fractions, the hazards inherent in their use and the medical responsibility for the conservation of blood, a precious human resource available only from the veins of human beings and impossible to produce in any factory.

(2) Blood Replacement: Furnishing of blood without stressing the obligation to replace it leads to a lack of appreciation both on the part of the recipient and too often on the part of the physician ordering the blood of the difficulties involved in getting it in the first place. It is the definite responsibility of every physician ordering the use of blood to see to it that those interested in the patient replace in the bank or collection center the blood which has been used. Blood banks cannot operate unaided, and the cooperation of every physician employing the resources of a blood bank is an essential factor in maintaining its solvency in blood. There is sufficient evidence that too many physicians fail to discharge this responsibility, and it is therefore again called to their attention in order that their patients may never lack for needed blood.

(3) Blood Type Cards: The practice prevailing in many blood banks, including the Red Cross Centers, of furnishing donors with a small card bearing name and blood type should be carried out generally. For every blood donor, for whatever purpose the blood is given, there should be prepared a card which can be furnished to him bearing this blood type information.

(4) Genuine Two-Way Cooperation: Your committee has been working to develop the principle thtat the National Blood Program is a cooperative program of great organizations and that due credit should be given at all times to all participating organizations. Some of the problems which have arisen may be attributed to the tendency of the Red Cross in some places to dominate in administrative and publicity matters to the discouragement of genuine two-way cooperation. Your committee has assisted in the resolution of difficulties such as these in some areas. Your committee recommends that the Red Cross furnish a certificate of participation suitable for display to each cooperating blood bank.

(5) Copies of This Report: Your committee recommends that a copy of this report, after adoption by the House of Delegates, be sent to each of the following: (*a*) The Health Resources Advisory Committee of the Office of Defense Mobilization; (*b*) The Chairman of the Armed Forces Medical Policy Council, Office of Secretary of Defense; (*c*) Director of Health and Special Weapons, Defense Division, Federal Civil Defense Administration; (*d*) Medical Director of the American National Red Cross; (*e*) Chairman of the Special Study Committee for the Blood Program of the American National Red Cross; (*f*) Chairman of the Committee on Blood Banks of the American Hospital Association; (*g*) President of the American Association of Blood Banks, and (*h*) Secretaries of state medical associations and Chairmen of State Committees on Blood Banks.

Respectfully submitted,

LEONARD W. LARSON, Chairman.
HERBERT P. RAMSEY.
JOHN W. GREEN.
JAMES R. REULING.
DEERING G. SMITH.
JAMES Q. GRAVES.
JAMES STEVENSON.
WILLIAM D. STOVALL.

REPORT OF REFERENCE COMMITTEE ON HYGIENE AND PUBLIC HEALTH

Dr. Charles L. Farrell, Chairman, presented the following r port, which was adopted:

Your committee also received the report of the Committee (Blood Banks to the Board of Trustees. Your reference committ heartily commends the Committee on Blood Banks for an e cellent report. However, inasmuch as the shortage of qualifi personnel is the basic problem in providing inspection and tec nical advice to blood banks and federal legislation could r possibly correct this deficiency, your reference committee reco mends that the last sentence in the next to the last paragra under the heading "Status of the National Blood Program" revised to read "It is recommended that consideration be giv to methods of providing additional inspection service includi the deputizing of state departments of health as inspectors wh they possess qualified personnel in this field."

Inasmuch as blood derivatives such as gamma globulin, fibr ogen et cetera are important resources the demand for whi is increasing, and human blood is the only source of these sential preventive and therapeutic agents, your reference co mittee recommends that No. 4 of the recommended uses human blood be expanded to read: "For continuing daily us for civilian needs, including fractionation of appropriate blc donations to provide gamma globulin, fibronogen, serum al men and other essential derivatives."

Inasmuch as the public, as a result of having been educa to the life-saving value of blood, on occasion brings pressure the physician to administer blood where it is not definitely in cated, your reference committee heartily commends the Co mittee on Blood Banks for its forthright statement regarding conservation of blood, the necessity for its replacement and physician's obligation to avoid abuse of blood and blood pr ucts. The committee recommends the adoption of the report the Committee on Blood Banks as amended.

Report of Special Committee of House of Delegates to Review Organizational Structure of the Standing Committees of the House

Dr. Robertson Ward, Chairman, presented the following port, which was referred to the Reference Committee on Misc laneous Business:

At the June 1951 session of this House of Delegates, a s plementary report of the Board of Trustees concerning a cha in composition of the Council on Medical Service was conside by the Reference Committee on Amendments to the Const tion and By-Laws. That reference committee reported a sub tute resolution to the House of Delegates, which was adopte

"That a special committee of the House of Delegates be pointed by the Speaker to review the organizational structure the standing committees of the House of Delegates, especially their relation to the Board of Trustees, and report to the Ho of Delegates at the next interim session in Los Angeles."

Pursuant to that resolution, the Speaker of the House of De gates appointed a committee composed of Drs. Warren W. Fur Chicago; James R. Reuling, Bayside, N. Y.; George A. Unfi Pueblo, Colo.; Edgar V. Allen, Rochester, Minn.; Harold Gardner, Pittsburgh; George F. Lull, Chicago; John W. Cli San Francisco, and Robertson Ward, San Francisco, as Ch man.

The committee has made a careful study through extens correspondence and personal interviews of the attitudes a opinions of the members of the Standing Committees, subco mittees of the Standing Committees, members of the headqu ters staff and the Board of Trustees, and, on the basis of t study, presents the following conclusions and recommendatio

CONCLUSIONS

1. An organization cannot function effectively unless it h one individual as its responsible executive officer, who delega junior executive authority to staff employees assigned to vario councils and committees. The Board of Trustees of the Americ Medical Association should be responsible to the House of De gates and the membership for all activities of the Associatic and there should be no boards, commissions or councils wit the Association having equal status with the Board of Trustees a status independent of the Board. When the lines of authori

are clearly established through the responsible executive officer to the Board of Trustees and the House of Delegates, confusion and uncertainty are eliminated and personnel morale improved.

2. The Constitution and By-Laws of the American Medical Association clearly provide for a Board of Trustees with adequate executive authority and power to direct the affairs and activities of the Association between meetings of the House of Delegates. Article 8 of the Constitution reads:

"The Board of Trustees shall have charge of the property and financial affairs of the Association and shall perform such duties as are prescribed by law governing directors of corporations or as may be prescribed in the By-Laws."

Under the By-Laws, "Chapter X.—Committees of the House of Delegates Section 3. Relation of Board of Trustees to Committees," the Board of Trustees is given definitive and unequivocal authority with respect to these committees. This Section reads:

"Committees that function during the interval beween sessions of the House shall be under the direction of the Board of Trustees."

3. This committee believes that there has been some misunderstanding on the part of both the Standing Committees of the House of Delegates and the Board of Trustees with respect to their relationship and proper lines of communication. It is apparent that the Board of Trustees has been reluctant to interpret literally the provisions of Section 3, Chapter X of the By-Laws because of a feeling that it might be overstepping its authority. It is also obvious that in some instances a Standing Committee of the House of Delegates has interpreted that status to mean that the Board of Trustees had relatively little control over its activities.

4. It is apparent that the programs of the Standing Committees are at times not given sufficient publicity in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION so that many members are not aware of the work being accomplished.

5. A member of the Trustees serves ex officio as one of the members of the Standing Committees. In this capacity he is forced to vote both with the Standing Committee and with the Board and thus is placed in the position of plaintiff and judge.

6. During the course of its investigation, your special committee has observed that only the Board of Trustees is limited in its terms of office. It believes that the policy embodied by the limitation of terms of office is sound, since it prevents a self-perpetuating small group from dominating a committee.

RECOMMENDATIONS

1. That this House of Delegates express its appreciation to the Board of Trustees for the general excellence of the program being developed under its direction, and that it direct the Board of Trustees to conduct the affairs of the Association and coordinate all activities of Standing Committees as provided in the Constitution and By-Laws, especially Section 3, Chapter X of the By-Laws quoted above.

2. That differences of opinion that may arise among Standing Committees concerning the scope of their respective areas of activity be resolved by the Board of Trustees.

3. That the programs of the Standing Committees be given adequate publicity in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION by the submission of informative reports from the Standing Committees concerned.

4. That any Trustee member of a Standing Committee of the House of Delegates be ex officio without vote.

5. That a ten year limit be placed on the terms of office of members of Standing Committees of the House of Delegates, to be made retroactive to Jan. 1, 1947.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Warren W. Furey, Chairman, presented the following report, which was adopted:

The discussion on this report was one of commendation and approval of the recommendations made by the Special Committee. The only question raised in reference to the report had to do with the ten year limit on the terms of office of members of Standing Committees of the House of Delegates. It is the recommendation of your reference committee that this paragraph be changed to read:

"That a limitation similar to that imposed on the Board of Trustees by the By-Laws be placed on the terms of office of members of Standing Committees of the House of Delegates, and that the matter be referred to the Committee on Constitution and By-Laws to make the necessary adjustment."

Your committee recommends approval of the report as a whole, as amended.

Resolution on Honoraria for President and President-Elect

Dr. Julian P. Price, South Carolina, presented the following resolution:

WHEREAS, The positions of President and President-Elect of the American Medical Association have assumed greater and greater importance during recent years; and

WHEREAS, The men who fill these positions are being called on so frequently for addresses and conferences throughout the country that it is taking them away from their personal work for long periods of time; and

WHEREAS, These men are giving this time, without any reimbursement except for the payment of actual expense in travel and sustenance, resulting in a marked reduction in personal income; and

WHEREAS, This has brought about a condition whereby only men who are on a salary or who have extra financial reserves on which to draw are able to accept these positions without a serious financial sacrifice to themselves and their families; and

WHEREAS, Such a condition could deprive the American Medical Association of the services of men whose leadership is needed; and

WHEREAS, It is the custom with certain large institutions to pay their nonsalaried officers a per diem honorarium for time spent on official work away from their personal businesses; and

WHEREAS, It is believed that the vast majority of the members of the Association would be glad to have a small fraction of their dues go toward the payment of such a per diem honorarium to these men who are leading their Association; therefore be it

Resolved, That this House of Delegates of the American Medical Association looks with favor on the payment of a per diem honorarium, in addition to expenses, to the President and President-Elect of the American Medical Association for time spent in the work and activities of the Association while away from their homes, and requests the Board of Trustees to give the matter careful consideration and to put such a plan into effect if feasible.

Resolution on Honorarium for President of American Medical Association

Dr. R. B. Robins, Arkansas, presented the following resolution, which also was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The President of the American Medical Association devotes most of his time to the duties of his office at great financial sacrifice; and

WHEREAS, It is becoming the custom of other large national organizations to compensate their presidents for loss of time from their regular occupations; therefore be it

Resolved, That the House of Delegates instruct the Board of Trustees to grant the President an honorarium of not less than five thousand dollars and not more than ten thousand dollars in addition to the regular per diem and travel allowance.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Warren W. Furey, Chairman, submitted the following report, which was adopted:

Two resolutions relating to this same subject were considered. The first was presented by Dr. Julian P. Price, South Carolina, in reference to honoraria for the President and President-Elect, and the second by Dr. R. B. Robins, Arkansas, entitled Honorarium for President of American Medical Association. There was considerable general discussion by a large group. Feeling was expressed that such officers should be given liberal per diem honoraria. Your reference committee approves the liberal per diem allowance and recommends that the amount be left to the discretion of the Board of Trustees. It recommends approval of the resolution presented by Dr. Julian P. Price.

Resolution on Medical Care Insurance on Service Basis for Dependents of Members of Armed Forces

Dr. R. L. Novy, Michigan, presented the following resolution, which was referred to the Reference Committee on Insurance and Medical Service:

WHEREAS, Dependents of members of the Armed Forces at times need medical care under circumstances that involve financial hardships, lack of adequate governmental facilities or both; and

WHEREAS, The physicians of the United States through their sponsored prepayment plans are able to provide care to such dependents on a service basis; and

WHEREAS, Many citizens entering military service already have protected their dependents against costs of illness through voluntary insurance; and

WHEREAS, Blue Shield and other medically sponsored plans enable their members to receive high quality medical care with free choice of physician; and

WHEREAS, Labor and industry generally have recognized that medical insurance benefits for dependents are important in developing better employe morale; now therefore be it

Resolved, That if in the independent judgment of the Department of Defense or Congress the welfare of our preparedness program requires that dependents of members of our Armed Forces receive medical care on a service basis, then the medical profession stands ready to provide such service through Blue Shield and other medical society sponsored plans.

REPORT OF REFERENCE COMMITTEE ON INSURANCE AND MEDICAL SERVICE

Dr. Raymond W. McKeown, *Chairman, submitted the following* report, which was adopted:

The Michigan delegation presented a Resolution on Medical Care Insurance on Service Basis for Dependents of Members of Armed Forces. After thorough deliberation your committee approved of the Michigan resolution.

Resolution on Fluoridation of Water Supplies

Dr. S. E. Gavin, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Hygiene and Public Health:

WHEREAS, There is conclusive and acceptable evidence that the ingestion of small amounts of fluorides during the period of tooth enamel formation produces a harder, more caries resistant enamel, thereby substantially and safely reducing the incidence of dental caries; and

WHEREAS, The fluoridation of water is a most effective approach to improving health through the prevention of dental decay and is economically advantageous to the public as well as the individual; and

WHEREAS, The fluoridation of public water supplies is approved and recommended by the American Public Health Association, the United States Public Health Service and the American Dental Association as in the interest of better health; now therefore be it

Resolved, That the House of Delegates of the American Medical Association endorse the principle of fluoridation of all public water supplies that are deficient in fluoride.

REPORT OF REFERENCE COMMITTEE ON HYGIENE AND PUBLIC HEALTH

Dr. Charles L. Farrell, *Chairman, submitted the following* report, which was adopted:

Your reference committee received two resolutions regarding the fluoridation of water supply, one submitted by Dr. Stanley Osborn of the Section on Preventive and Industrial Medicine and Public Health, and one by Dr. S. E. Gavin for the State Medical Society of Wisconsin. Your committee has heard testimony and reviewed literature on the subject and submits the following resolution as a substitute:

WHEREAS, Carefully controlled studies have demonstrated that fluoridation of water supply has been definitely beneficial in the reduction of dental caries in the younger age group; and

WHEREAS, The Council on Pharmacy and Chemistry has reported that fluoride is nontoxic in community water supplies up to one part per million; and

WHEREAS, The addition of fluoride to community water supplies seems to have merit; therefore be it

Resolved, That the House of Delegates of the American Medical Association endorse the principle of fluoridation of community water supplies.

Resolution on Purchase of Property in Washington

Dr. S. E. Gavin, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The Washington office of the American Medical Association is recognized as a highly important information and research center serving members of Congress, government officials and agencies, members of the Association and others; and

WHEREAS, The effectiveness of this office would be greatly enhanced by convenient location and appropriate library and research facilities to provide more adequately for study, analysis and reporting in circumstances demonstrating not only the ideals and dignity but the efficiency of the Association; and

WHEREAS, The location and the cost of maintaining desirable rental property will be a continuous problem for the Association; therefore be it

Resolved, That the House of Delegates of the American Medical Association urge the Board of Trustees to purchase suitable property in Washington, D. C., to serve as a permanent headquarters for the Washington office of the Association.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Warren W. Furey, Chairman, presented the followin report, *which was adopted:*

This matter was discussed and your reference committee, afte due consideration, *reports support of the resolution* in principl but recommends the following changes in the resolution to rea as follows:

Resolved, That the House of Delegates of the American Medical Ass ciation authorize the *Board of Trustees* to consider the purchase of su able property in Washington, D. C., at an opportune time to serve as permanent headquarters for the Washington office of the Association.

Your committee approves of the resolution as amended.

Resolution on Emergency Seating of Alternate Delegates

Dr. *John J. Curley, Massachusetts*, submitted the followin resolution, which was referred to the *Reference* Committee o Amendments to the Constitution and By-Laws:

WHEREAS, The House of Delegates of the American Medical Associatic has expressed its opinion that all states and territories should be rep sented at all times in sessions of the House of Delegates; and

WHEREAS, The House of Delegates approved a change in the Constit tion and By-Laws of the American Medical Association at its 1951 annu session whereby in emergencies a responsible state officer may designa an alternate to represent a delegate, if such delegate is taken ill or call away from a meeting of the House of Delegates; and

WHEREAS, It is often difficult to get a state officer, namely the Preside or Secretary of a state or territorial association, to give a written crede tial to an alternate; and

WHEREAS, Often the President or Secretary of a state or territorial ass ciation is not present at the meetings of the House of Delegates; and

WHEREAS, Some state and territorial associations elect a specific alterna for each delegate to the meetings of the House of Delegates; therefo be it

Resolved, That in case of emergency as designated by the House Delegates and in case a responsible officer of a state or territorial medic association cannot give written credentials to an alternate of that sta or territorial medical association, a majority of the delegates of such sta or territorial medical association shall be allowed to designate any du *elected alternate to represent that* state or *territorial medical* associatic for the remainder of the meeting of the House of Delegates. In the stat or territories where one to three represent the above mentioned asso ations, the single member or the two remaining members shall be permitt to choose the alternate to represent their state or territory if a responsib state or territorial officer cannot be reached to designate the alternate represent the absent delegate.

REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO THE CONSTITUTION AND BY-LAWS

Dr. Leo F. Schiff, Chairman, presented the following repo which was adopted:

The resolution presented by Dr. John J. Curley for the Mass chusetts delegation, proposes a method of designation of a su stitute delegate when, in emergency, the regularly elected del gate or alternate cannot serve and a responsible officer of constituent state or territorial medical association cannot reached in time to furnish written credentials for such substitu

Although an amendment to the By-Laws adopted at the annu session in 1951 would seem to authorize appointment of a del gate for a constituent association under certain emergency cond tions, Section 2 of Article 6 of the Constitution states: "Th House of Delegates is composed of delegates *duly elected* by th constituent associations. . . ." In the opinion of your com mittee, the action requested cannot be taken without amen ment of the Constitution. Further, your committee believes th the third paragraph of Section 1 (D) of Chapter IX of the By Laws is not in accordance with the Constitution, and therefo recommends that the resolution be referred to the standin Committee on Constitution and By-Laws and, further, that th committee be requested to review Section 1 (D) of Chapter I of the By-Laws in reference to its constitutionality.

Resolution on Fluoridation of Public Water Supplies

Dr. Stanley H. Osborn, Section on Preventive and Industria Medicine and Public Health, submitted the following resolution which was referred to the Reference Committee on Hygiene an Public Health:

WHEREAS, Accumulated evidence indicates a sound basis for the fluorida tion of public water supplies for the control of dental caries; and

WHEREAS, All evidence to date supports this promising preventive denta health measure wherever it has been instituted; therefore be it

Resolved, That the House of Delegates of the American Medical Asso-iation approve the fluoridation of public water supplies as a safe, eco-omical and effective method of reducing the prevalence of dental caries f the people.

The report of the Reference Committee on Hygiene and Pub-ic Health on the above resolution will be found following the esolution on Fluoridation of Water Supplies presented by Dr. avin of Wisconsin on page 1698.

Resolution on Congressional Investigation of the Teaching of Collectivism in Schools

Dr. Eugene F. Hoffman, California, presented the following solution, which was referred to the Reference Committee on egislation and Public Relations:

WHEREAS, There has been some misunderstanding concerning the resolu-n adopted by the House of Delegates in June 1951, calling for a ongressional investigation of the teaching of collectivism in our schools; it

Resolved, That the American Medical Association hereby reaffirms its lief in and support of the American public school system as a bulwark our constitutional republic and that system must exercise its proper nction of disciplining and instructing our youth in order that they on e attainment of maturity may assume their rightful positions as respon-le and productive citizens; and be it further

Resolved, That the attention of every American is once again directed the dangerous inroads on our national thinking already achieved by e insidious philosophy of collectivism. Those educators who have seen is danger and are opposing it deserve our hearty commendation and thusiastic support. Those who have attempted to pervert our school stem from its true educational function to that of indoctrination should relieved of further opportunity to achieve their goals.

REPORT OF REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS

Dr. R. B. Robins, Chairman, submitted the following report, hich was adopted:

The committee approves of the resolution and recommends its loption.

Resolution on Death of Dr. James Edgar Paullin

Dr. Eustace A. Allen, Georgia, presented the following reso-tion, which was adopted by a unanimous rising vote on motion ly made, seconded and carried:

American medicine has been fortunate in having great men as its leaders ing the past fifty years. Dr. James Edgar Paullin was among those o did much to elevate the standing of our profession to its present ition. His apprenticeship was served with Sir William Osler and the s and ambitions of his great teacher were emulated throughout his fessional career. Dr. Paullin's contributions to medical education, earch, national defense and organized medicine will not be surpassed any one of our time. Integrated with his professional ability was a rm personality which endeared him to all who were associated with him.

To lament the passing of one so great is the usual pattern of such a olution. More fitting for Dr. Paullin's passing, however, is an expression gratitude for his years of service to American medicine. He served many years in the House of Delegates and was President of the merican Medical Association in 1943.

Longfellow, with his poetic ability, has well described Dr. Paullin's pact on American medicine in the following lines:

> "So when a great man dies,
> For years beyond our ken
> The light he leaves behind him lies
> Before the paths of men."

The end came as he wished, suddenly, while working among his friends d associates of many years and with his family; therefore be it

Resolved, That the House of Delegates of the American Medical Asso-tion wishes to express its feeling of an irreplaceable loss in the death Dr. James Edgar Paullin on August 13, 1951; and be it further

Resolved, That a copy of these resolutions be forwarded to the family our deceased friend.

Resolutions on Death of John F. Hayes

Dr. H. G. Hamer, Indiana, presented the following resolutions, hich were referred to the Reference Committee on Miscel-neous Business:

WHEREAS, In the death of John F. Hayes, the medical profession has st a friend and champion whose wise and valiant efforts on its behalf ave entitled him to the lasting gratitude of the profession; and

WHEREAS, The medical profession of the State of Indiana in particular kes special pride in the fact that he was born in this state, and for at reason would like to have the privilege of initiating the action through hich a memorial to him may be preserved not only in the records of he Indiana State Medical Association, but also in the records of the merican Medical Association; now therefore be it

Resolved, That the permanent records of the Indiana State Medical Association shall include this resolution in which is incorporated the following statement regarding him:

John F. Hayes, whose death occurred on Sept. 17, 1951, leaves an inspiring record of achievements which have made the country, and particularly the medical profession of America, deeply his debtor. He was born in Indiana and graduated from the Indiana Law School in 1898. He expected from his childhood to earn his way in the world and not have it opened out before him because of the fortunes of birth or the favors of gratuitous patronage. He became a competent stenographer and in that capacity was employed by the late Senator Albert J. Beveridge, whose achievements have entitled him also to undying fame as one of the great statesmen and authors of America.

Mr. Hayes was not content to do what was merely within the call of duty of his employment. Beyond the call of only that duty he studied intensively the subjects covered by his stenographic notes. He not only did the manual work of typing, but contributed brilliantly to the very language of such legislation as the Federal Meat Inspection Act, the Tariff Commission Act and child labor legislation.

This country could not function and our liberties be preserved if people were indifferent to politics. It is the means through which self-government is carried on. From 1909 to 1912, Mr. Hayes was the secretary of the Indiana State Republican Committee. Senator James E. Watson of Indiana, on being elected to the Senate in 1916, appointed Mr. Hayes as his secretary, in which position he served until 1935 when he entered into the law practice in Washington, D. C., which he continued until his death.

For many years he was associated with the Bureau of Legal Medicine and Legislation of the American Medical Association, in which position he served with the same quiet, unostentatious efficiency as in every other position he occupied.

The life and work of Mr. Hayes stands as the proof that modesty and contentment with one's own soul's applause may be retained by a person and still that person may render a distinguished political service in America. Senator James Watson said of him, "To the ability and industry of John F. Hayes in the discharge of his duties, I owe much of my success in public life."

The name of John F. Hayes should be cherished in the memory of the medical profession of Indiana and of the whole United States and of all who knew him or may ever read this memorial, as a man who has in quietness and modesty demonstrated, to the inspiration of all, how much may be accomplished through "one man's plain truth to manhood and tained in this resolution; and be it further

Resolved, That the Indiana delegation to the House of Delegates of the American Medical Association be authorized and instructed to present a motion in that House to adopt a resolution to accept and make a part of the records of that Association the memorial to John F. Hayes contained in the resolution; and be it further

Resolved, That a copy of this resolution be sent to his widow, Mrs. Mary Carson Hayes, and to his son, John Hamilton Hayes, with the sympathy and condolence of the members of the Indiana State Medical Association.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS

Dr. Warren W. Furey, Chairman, presented the following report, which was adopted:

Your reference committee concurs in the sentiments of the Resolution on Death of John F. Hayes and recommends approval of the suggested recording of the memorial.

Resolution on Deferment of Chiropractic Students

Dr. A. S. Giordano, Indiana, submitted the following resolution, which was referred to the Reference Committee on Medical Military Affairs:

WHEREAS, It has been reported that on September 27, 1951, under the Universal Military Training and Service Act, a regulation was promulgated under which students of chiropractic were made deferable on the basis that they were students of a healing art and should be included among deferable students, such as students of engineering, chemistry, medicine, dentistry and other scientific subjects; and

WHEREAS, Other students who are made deferable must be students of recognized schools and colleges maintaining standards of sound educational merit, while no school of chiropractic exists in America that maintains educational standards the equivalent of the standards maintained in the other schools in which deferable students are enrolled; and

WHEREAS, It has been scientifically demonstrated that chiropractic is without merit as a healing art and that no school of chiropractic gives training adequate to prepare any of its students for service useful to mankind as practitioners of any art of healing; and

WHEREAS, Chiropractors, without first acquiring or attempting to acquire adequate preparation in the nature of true scientific study, are continuously engaged in an effort to obtain unmerited recognition in the Armed Forces and the civilian population of the United States as properly trained practitioners of a healing profession and are trying to accomplish their purpose solely through lowering the standards of education and training presently required for such recognition; and

WHEREAS, Heretofore no recognition has been given to chiropractors in the Armed Forces of the United States, and chiropractic services are not used in treating wounds or diseases in the public health services nor in the Armed Forces of the United States; and

Whereas, Whatever is done to lower the standards of medical care, either in the Armed Forces or in the civilian population, is against the best interests of the public and for that reason should be vigorously opposed and resisted; and

Whereas, Anything that is done by the Government, which may be construed as something in the nature of recognition of merit in chiropractic, will certainly be immediately seized upon and used by chiropractors for propaganda purposes in behalf of their own commercial interests but to the disadvantage of the public; therefore be it

Resolved, That the Indiana State Medical Association hereby protests against any regulation under which students of chiropractic may be deferred on that ground under the Universal Military Training and Service Act; that the association recommends that chiropractic students be eliminated from the groups who are deferable under that law; that the Indiana delegates to the American Medical Association be, and hereby are, instructed to present to the next meeting of the House of Delegates of the American Medical Association a resolution of the same nature as this one and work for its adoption; and be it further

Resolved, That a copy of this resolution be mailed to the President of the American Medical Association and to the presidents of the various state medical association and also to the members of the Senate and House of Representatives from the State of Indiana, to the Surgeon General of the United States, to the Secretary of Defense of the United States and to the President of the United States.

Report of Reference Committee on Medical Military Affairs

Dr. H. L. Pearson Jr., Chairman, submitted the following report, which was adopted:

For the resolution presented to the House by the Indiana Delegation pertaining to the deferment of chiropractic students under the Military Training and Service Act your committee presents the following substitute resolution:

Whereas, The Universal Military Training and Service Act of 1951, as amended, provides for the possible deferment of students of chiropractic, among others, under the Selective Service System; and

Whereas, It has been scientifically demonstrated that chiropractic is without merit as a healing art and that there is no current need in the Armed Forces for graduates of schools offering such instruction; therefore be it

Resolved, That the American Medical Association hereby protest against the promulgation of any regulation by the Selective Service System under which students of chiropractic may be deferred under the Universal Military Training and Service Act of 1951, as amended.

Resolution on Medical Fees

Dr. George Braunlich, Iowa, submitted the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Whereas, It is self-evident that to increase medical or hospital fees because a patient is covered by insurance is unfair, discriminatory, inflationary and contrary to fair play; therefore be it

Resolved, That it is unethical for a physician to increase his fee because that fee is to be paid by an insurance company, directly or indirectly.

Report of Reference Committee on Miscellaneous Business

Dr. Warren W. Furey, Chairman, presented the following report, which was adopted:

This resolution was discussed at length. It is the opinion of the reference committee that the substance of this resolution is already contained in the Principles of Medical Ethics, and it is the feeling of the reference committee that it could be handled readily at the local level by ethics and grievance committees. Your committee, therefore, recommends that the resolution be not adopted.

Resolution on Cancellation of Delinquent Dues

Dr. J. Duffy Hancock, Kentucky, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Whereas, The American Medical Association has distinguished itself as a guardian of the health and medical welfare of the people and has demonstrated its vigor and effectiveness in the battle against compulsory insurance; and

Whereas, It is most desirable that the American Medical Association not only maintain but increase its capacity to carry on the battle against disease, quackery and socialism; and

Whereas, Its policy of requiring all members of state medical associations up to and including 1950 to pay 1950 American Medical Association dues of $25.00 before being able to join the American Medical Association in 1951 or any subsequent year arouses resentment on the part of some of the members and has a tendency to reduce its usefulness; and

Whereas, This policy not only creates antagonism for the American Medical Association but also generates ill feeling for the state association officers who attempt to collect back American Medical Association dues; and

Whereas, This policy is creating much additional and unnecessary work and correspondence for the state medical association officers; therefore be it

Resolved, That the House of Delegates rescind its action and allow a encourage all members in good standing of state medical associatio before or during 1950 who did not pay American Medical Associatio dues in 1950 to join the American Medical Association in 1951 or su sequent years without penalty or prejudice.

Report of Reference Committee on Miscellaneous Business

Dr. Warren W. Furey, Chairman, presented the following r port, which was adopted:

The implications of this resolution were considered at leng and discussed freely by representatives of many state delegation by officers and by members of the American Medical Associ tion. It is the feeling of your reference committee that blank remission of dues as contained in the resolution might crea further misunderstanding and confusion. Your committee reco nizes that a solution of this problem which would permit co tinuous enlargement of the membership should be encourag It therefore recommends a substitute resolution:

Resolved, That the House of Delegates give to the Secretary of t American Medical Association the authority to negotiate with each st organization separately as to the method of correcting misunderstandi which exist relative to the collection of 1950 dues only.

Resolution on Blue Cross Benefits for Use of Physicians' Office Facilities

Dr. J. Duffy Hancock, Kentucky, submitted the following res lution which was referred to the Reference Committee on I surance and Medical Service:

Whereas, Blue Cross hospitalization insurance plans are usually limi by enabling acts to pay benefits to hospitals only; and

Whereas, It appears desirable from both an economic and pu service aspect that such plans should pay benefits when subscribers m use of physical facilities and supplies in a physician's office in lieu being admitted to a participating hospital where similar facilities are av able; and

Whereas, Many medical services for which subscribers now request a mission to a hospital could be equally well rendered in a physician's of with consequent reduction in the total claim against Blue Cross; and

Whereas, In many areas additional costs are incurred transporting patient to a hospital when the emergency care could more properly a efficiently be rendered in a local physician's office; and

Whereas, Revisions in Blue Cross policies to provide for payment physicians for use of their own office facilities, equipment and suppl only, not including professional services, which may be covered un Blue Shield plans, would result in a savings to Blue Cross plans and resultant conservation of the funds available for benefits of their insur now therefore be it

Resolved, That this House of Delegates instruct its Council on Medi Service to confer with the Blue Cross Commission in an endeavor effect a revision in Blue Cross plans that will provide for payment to p sicians for use of their facilities, but not services, when such facilities used in lieu of hospital facilities under an agreed fee schedule.

Report of Reference Committee on Insurance and Medical Service

Dr. Raymond M. McKeown, Chairman, presented the f lowing report, which was adopted:

The resolution introduced by the delegate from Kentucky w most thoroughly discussed. The substance of the Kentucky re lution namely, interrelationships between Blue Cross and Bl Shield, is of deep interest and concern to all physicians over th country. However, it was felt by your committee that the exists procedural technic by which these differences can settled at the state level. It was further felt that through a stron ly united medical profession such problems as existed he could readily be cleared. The resolution from Kentucky was n approved.

Resolution on Medical Care of Veterans

Dr. James Z. Appel, Pennsylvania, presented the followi resolution, which was referred to the Reference Committee o Legislation and Public Relations:

Whereas, The American Medical Association has welcomed the opp tunity to contribute to the medical care of veterans through the mediu of the Veterans Administration hospitals within the nation, wishing to its share in assuring the finest care to all who have sustained disabili or illness in defense of their country; and

Whereas, Proper and amicable relationship of the doctors of the nati with the Veterans Administration is essential for the provision of su first quality care to patients in these institutions; and

Whereas, Blue Shield Plans and other facilities for voluntary prepa medical care insurance have been established as cooperative enterprises doctors and the public, and many veterans are subscribers or beneficiari of such medical care insurance plans; and

Whereas, It is an established fact that in spite of regulations to the contrary, veterans with non-service-connected disabilities and illnesses and who are subscribers or beneficiaries of medical care insurance plans are being hospitalized in Veterans Administration hospitals without valid reference to their obvious ability to finance medical care; therefore be it

Resolved, That this House of Delegates of the American Medical Association instruct the Board of Trustees of the American Medical Association to attempt, through proper channels, to have legislation introduced into the Congress of the United States which would have the effect of canceling the present inequities now permitted under the law and would provide hospitalization, necessary transportation and domiciliary care to all veterans for service-connected disabilities, and for non-service-connected disabilities to render similar care only in those cases of proven inability to pay either by cash or by prepayment insurance.

Resolutions on Use of Veterans' Facilities by Veterans with Non-Service-Connected Disabilities

Dr. James P. Wall, Mississippi, submitted the following resolutions, which also were referred to the Reference Committee on Legislation and Public Relations:

Whereas, When the adoption of The American Constitution was under discussion, John Adams, "The Father of the Constitution," uttered this truism: "You have certain rights antecedent to all earthly governments; rights that cannot be repealed or restrained by human legislation; rights derived from the Great Legislator of the Universe"; and

Whereas, Among these rights, guaranteed by the Constitution, is the right of appeal and petition; and

Whereas, The American citizen is entitled to and demands the privilege to express his views on all matters that affect him and is very reluctant to yield this interest to pressure groups, however well organized, motivated by aggrandizement, nurtured by the long exercise of special privilege; and

Whereas, The veterans of our armed services are entitled to the lasting regard of the citizenry, for they have given and been given that we might live and have an abundant life; if such a veteran has suffered a disability because of his term of service, it is agreed by all that it is the solemn obligation of his Government to rehabilitate him as far as possible to his state of comfort and usefulness before his duty with the armed forces; the soldier who on his discharge from duty has no disability, actual or exaggerated, due to his services in the armed forces, is not and should not be the beneficiary of tax money for the relief of illness acquired after a period, when such illness cannot be connected with his term of service in the Armed Forces, because a soldier's patriotism should be for the perpetuation of his Government and not for pecuniary gain; and

Whereas, Dependent on the different localities of the Nation, the Veterans Hospitals' beds are occupied by veterans with non-service disability from 66 per cent to 83 per cent of the hospitals' bed capacity; such a veteran's occupancy of such a bed is a form of paternalism or even an entering wedge to the socialization of medicine and should not be tolerated; there are voluntary insurance plans that are adequate to care for the non-service veterans' disability; therefore be it

Resolved, By the House of Delegates of the American Medical Association, in interim session in Los Angeles, California, December 4-7, 1951, that we do whole-heartedly commend the United States Veterans' Administration in its most laudable effort to rehabilitate veterans with service-connected disability, but we strongly deprecate the use of the Veterans' Facilities by veterans without service disabilities; and be it further

Resolved, That a copy of this resolution be forwarded to the proper committee of the Congress that has the consideration of veterans' legislation.

Resolution on Medical Care of Veterans

Dr. C. M. Hamilton, Tennessee, introduced the following resolution, which also was referred to the Reference Committee on Legislation and Public Relations:

Resolved, By the House of Delegates of the American Medical Association that we recommend to the Congress of the United States the adoption of a program of medical and hospital benefits for veterans as follows:

Part 1. That the veterans who require hospitalization for the following types of disabilities be eligible for services in veterans' hospitals:

A. Service-connected disabilities.
B. Tuberculosis.
C. Mental illness.
D. Other forms of chronic illness which require hospitalization for more than ninety days.
E. Disabilities in dispute as to whether service-connected or not.

Part 2.

A. That a standard medical and hospital insurance policy be purchased at government expense for the benefit of every veteran who is unable to pay the premium cost of such coverage.
B. That the insurance coverage embrace disabilities which require hospitalization, excepting those outlined in Part 1, and disabilities which are covered by compensation laws or other forms of public liability.
C. That "the ability to pay" for such insurance coverage be determined on the basis of "the taxable income" of the veteran as determined for federal income tax purposes.
D. That the Congress of the United States determine the income level at which the veterans would cease to be eligible for this benefit.
E. That the insurance policy be written on an annual basis.
F. That the government, through existing agencies, issue checks to eligible veterans which are payable only for purposes of such insurance coverage, and cashable only when signed by the veteran and countersigned by an approved insurance company.

Report of Reference Committee on Legislation and Public Relations

Dr. R. B. Robins, Arkansas, presented the following report, which, after discussion, was adopted:

The resolutions introduced by Dr. J. P. Wall, Mississippi, regarding veterans' facilities for non-service-connected disabilities, the resolution presented by Dr. James Z. Appel, Pennsylvania, regarding medical care of veterans and the resolution presented by Dr. C. M. Hamilton, Tennessee, regarding medical care for veterans, which cover the same basic subject, were read and considered with deep interest, they have been the subject of extensive discussion at the hearings before this committee. Particularly we wish to commend Dr. H. H. Shoulders of Tennessee for the persevering, conscientious, earnest effort he has made toward a solution of the complex problem with which we are faced in dealing with non-service-connected disabilities of veterans and their medical care.

Inasmuch as this problem concerns many groups, such as veterans' organizations, voluntary hospital associations, civilian medical care, voluntary insurance organizations and many others, this committee recommends that the entire problem be referred to the Board of Trustees. It further recommends that the Board, at an early date, create a special committee to consider this complex problem in conference with other groups involved at the top flight or policy making level. Your committee realizes that this is a matter which requires persistent, continuous study, and definitely urges the Board of Trustees to make a report of the activities of the special committee at the June session in Chicago.

Resolutions on Critical Materials

Dr. J. Stanley Kenney, New York, introduced the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

Whereas, The strength of our nation depends in large measure on the health of the American people, both those in the Armed Forces and those in our vital industrial and agricultural economies; and

Whereas, Health and medical services are highly essential activities directly supporting national defense; and

Whereas, Manpower available for civilian medical care is decreased in times of national emergency, making hospitals more necessary as a means of extending the available medical skills; and

Whereas, The amount of controlled materials provided for proposed new construction projects is insufficient to maintain the necessary level of hospital construction; therefore be it

Resolved, That the American Medical Association urgently requests the establishment of a high degree of priority for materials for construction of hospitals and health facilities and for fabrication of medical equipment and supplies where need can be shown, so that our national health can be properly maintained; and be it further

Resolved, That this resolution be transmitted to the Director of Defense Mobilization.

Report of Reference Committee on Miscellaneous Business

Dr. Warren W. Furey, Chairman, presented the following report, which was adopted:

Your reference committee discussed the contents of the Resolutions on Critical Materials and is in sympathy with the recommendations. It therefore recommends approval of the resolutions.

Resolutions on Deficient Teaching Programs of Dermatology and Syphilology of Some Medical Schools

Dr. Everett C. Fox, Section on Dermatology and Syphilology, introduced the following resolutions, which were referred to the Reference Committee on Medical Education and Hospitals:

Whereas, The American Medical Association is interested in well-trained general practitioners of medicine; and

Whereas, Dermatology and syphilology constitute a large segment of the practice of medicine as a whole; and

Whereas, Eight per cent of all admissions to military hospitals during World War II were dermatologic patients; and

Whereas, Twelve to fifteen per cent of all questions in Queries and Minor Notes in The Journal of the American Medical Association pertain to dermatology and syphilology; and

Whereas, *It has come to the attention of this Section that there is a* wide disparity in regard to the allotment of time devoted to the teaching of dermatology and syphilology, verging almost to complete neglect in some medical colleges; therefore be it

Resolved, That the Section on Dermatology and Syphilology of the American Medical Association deplores the deficient teaching programs of dermatology and syphilology of some medical schools; and be it further

Resolved, That this resolution be brought to the attention of the House of Delegates of the American Medical Association, the Board of Trustees, the Council on Medical Education and Hospitals and the Special Committee on Medical Education.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION AND HOSPITALS

Dr. Joseph D. McCarthy, Chairman, submitted the following report, which was adopted:

The Council on Medical Education and Hospitals has requested that these resolutions be turned over to the Council so that the recommendations contained therein may be put in force. Your committee recommends the adoption of these resolutions.

Resolution on Approval of Internships

Dr. W. W. Baum, Oregon, read a Resolution on Approval of Internships (see THE JOURNAL, Nov. 24, 1951, page 1241), which was referred to the Reference Committee on Medical Education and Hospitals.

The report of the reference committee will be found in the third paragraph under the sideheading "Graduate Training" following the report and supplementary report of the Council on Medical Education and Hospitals on page 1689.

Resolutions on Proposed Amendment to By-Laws to Include General Practitioner Award

Dr. John F. Burton, Oklahoma, introduced the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws:

WHEREAS, The American Medical Association since 1948 has selected a "General Practitioner of the Year" and made an appropriate presentation to him; and

WHEREAS, This presentation has been a fitting and proper tribute to the general practitioner of the year and through him a tribute to the dedication to mankind of the members of the medical profession; and

WHEREAS, This recognition by the American Medical Association of the very real contributions of general practitioners to the health of the people of this Nation has inured to the benefit of the people and the profession; therefore be it

Resolved, That Division Three of the By-Laws be and is hereby amended by the insertion after the present Chapter XV, of the following words and figures which shall be designated Chapter XVI.

"CHAPTER XVI.—GENERAL PRACTITIONER'S AWARD

"Section 1. BOARD TO ESTABLISH AWARD.—The Board of Trustees shall prepare and arrange for the presentation annually, at the Clinical Session, of a suitable General Practitioner's Award of the American Medical Association, to a Member of the Association selected by the House of Delegates as General Practitioner of the Year in accordance with such procedure as the House of Delegates may prescribe."; and be it further

Resolved, That present chapters in Division Four be renumbered as Chapters XVII, XVIII, XIX and XX consecutively.

REPORT OF REFERENCE COMMITTEE ON AMENDMENTS TO THE CONSTITUTION AND BY-LAWS

Dr. Leo F. Schiff, Chairman, presented the following report, which was adopted:

The resolutions presented by Dr. John F. Burton, Oklahoma, propose an amendment to Division Three of the By-Laws to provide for the annual presentation of a General Practitioner Award. Your committee feels that it is inadvisable at this time to amend the By-Laws for this purpose. This award was established by action of the House of Delegates and has been continued each year. The authority given by this action of the House is sufficient to continue the practice so long as it may seem advisable. Your committee therefore recommends that these resolutions be not adopted.

Resolution on Place of Interim Sessions of House of Delegates

Dr. George A. Woodhouse, Ohio, presented the following resolution which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, It has been customary for the House of Delegates to hold its interim session during the clinical session of the American Medical Association; and

WHEREAS, This has required excessive travel on the part of many delegates who seldom have time to attend the clinical sessions; and

WHEREAS, This requires travel on the part of many members of the staff of the Chicago office of the American Medical Association to some distant city and the shipment of many records and supplies from Chicago, entailing considerable expense to the Association; therefore be it

Resolved, That the present plan of holding the annual clinical session of the American Medical Association at various geographical centers throughout the country should be continued, but the annual interim session of the House of Delegates should not be held at the time and place of the clinical session as it would be more practical for the House of Delegates to hold its interim business session in the city of Chicago, preferably during the month of December.

REPORT OF REFERENCE COMMITTEE ON MISCELLANEO BUSINESS

Dr. Warren W. Furey, Chairman, submitted the follo
report, which was adopted:

There was considerable free discussion of the advant
and disadvantages of the clinical session and the concurrent
ing of the House of Delegates. The reference committee un
stands that the Council on Scientific Assembly is now stud
the problem. It is the feeling of the committee that the Co
should further study the problem, considering the necessit
delegates and officers coming to both meetings, of the fin
involved and the travel difficulties encountered. Your comm
therefore, recommends no action at this time.

Resolutions on Health Problems of the Older Work

Dr. Donald Cass, California, introduced the following
lutions, which were referred to the Reference Committe
Industrial Health:

WHEREAS, Manpower requirements for defense industry have neces
the employment of many older age workers; and

WHEREAS, Prolongation of life induces an aging population with ch
demands for health, employment and retirement; and

WHEREAS, These trends strongly influence future demands on the m
profession in general and occupational medicine in particular; the
be it

Resolved, That the Council on Industrial Health extend its intere
activities in the investigation of the health problems of the older w
and be it further

Resolved, That this project receive essential financial support; and
further

Resolved, That the Council report its findings to the House
earliest opportunity.

REPORT OF REFERENCE COMMITTEE ON INDUSTRIA HEALTH

Dr. Millard D. Hill, Chairman, presented the following r
which was adopted:

The committee recommends the adoption of this resol

Message from Miss Hattie A. Niehoff

The Speaker informed the House of Delegates regard
message received from Miss Hattie A. Niehoff, as follows:

Shortly after the conclusion of the June session, I had a
delightful letter from our good friend, Miss Hattie Niehoff
said that she was quite disturbed and naturally unnerv
the presentation of the purse to her from the members o
House of Delegates and her friends, and she had not for
presented her thanks. She asked me to do that today.

Presentation of General Practitioner's Medal to Dr. A. C. Yoder

Dr. John W. Cline, President, introduced to the Hou
Delegates Dr. A. C. Yoder, Goshen, Ind., was was e
General Practitioner of the Year by the House on Dece
4, and presented to him the gold General Practitioner's M
Dr. Yoder addressed the House briefly.

Presentation of Citation to Dr. Kellogg Speed

Dr. E. J. McCormick, Trustee and Chairman of the Adv
Committee on Scientific Exhibit, introduced Dr. Kellogg S
Chicago, and presented him with a citation for his conduct
the years of the Association's Exhibit on Fractures.

Broadcast by N. B. C.

Dr. Elmer L. Henderson, Past President, announced tha
National Broadcasting Company will put on on Sunday,
cember 9, a thirty minute "live" broadcast of activities of
American Medical Association at the Los Angeles *Clinical*
sion, which will be of no expense whatever to the Associa

The House of Delegates extended a vote of thanks to
National Broadcasting Company for this delightful gesture

Motions of Appreciation

On motions duly made, seconded and carried, express
of appreciation were made to the Co-Chairmen of the L
Committee on Arrangements, Drs. J. Walter Scott and J.
Ludwig, the City of Los Angeles, and the local Chambe
Commerce, and a rising vote of thanks was given to the
ordinating Committee of the American Medical Association
the splendid public program on the night of Wednes
Dec. 5, 1951.

MEDICAL NEWS

CONNECTICUT

Sociologist Appointed to Pediatric Department.—The Yale University School of Medicine has appointed for the first time a sociologist to the staff of its department of pediatrics "to add o the effectiveness of medical care for children." The sociologist, who will hold the rank of research assistant, will actually have a special sociology internship in pediatrics. The appointment, which is supported by the Russell Sage Foundation, is for one year but will be renewable if results are promising. Because the rend of modern knowledge emphasizes the importance of treatng the patient as a "whole person" and not merely as a "sick ody," it is believed that the effect of the hospital environment n the sick child and on his family needs reevaluation and that he services of a sociologist will be of value.

LLINOIS

Open State Narcotic Clinics.—The Illinois Department of Public Health has opened two state narcotic clinics in Chicago. The rst is located at Provident Hospital on Chicago's South Side, nd the second at the University of Illinois Research and Eduational Hospitals on the West Side. Another is to be opened n the North Side as specified in an act passed by the last general assembly. These clinics were created primarily for the revention of drug addiction among Chicago youths and the reabilitation of addicts who have received treatment elsewhere. perating expenses are to be underwritten by the state health epartment, which made an appropriation of $90,000 for setting p the clinics. At Provident Hospital the clinic is staffed by a sychiatrist, a clinical psychologist, a psychiatric social worker, nd a field social worker. Dr. Walter A. Adams, head of the sychiatric staff, is director there. It will be conducted as an utpatient center handling about 30 patients weekly, giving such rvices as psychiatric, psychological, and medical counseling. will be a source of information to parents who believe their ildren may be using drugs. The rehabilitation program will onsist of counseling and assisting persons discharged from uch sources as the U. S. Public Health Service's hospital for arcotic victims at Lexington, Ky., and the Chicago House of orrection.

The Narcotics Research Clinic at the University of Illinois ill provide special study and treatment in about 30 selected ases per year to gain some information about the causes that ad adolescents to become drug addicts. Dr. Irene C. Sherman, ssistant professor of psychiatry, is director of the clinic.

Chicago

New Infant Station.—The new $192,000, 40-bed infant station Michael Reese Hospital was dedicated by members of Infants' id November 25. Infants' Aid, the women's organization that made possible the first premature infant station of the hospital years ago, is reported to have contributed more than $200,000 the nursery since its founding.

University Appointments.—Dr. Henrietta M. Herbolsheimer, eputy director of the Illinois Civil Defense Agency, has resigned to join the faculty of the University of Chicago as assistant professor of preventive medicine. Before joining the civil efense staff she had served as medical administrative assistant Dr. Roland R. Cross, director of the state department of ublic health.

KENTUCKY

Grants for Heart Research.—Two grants totaling $15,035 have been awarded for heart disease research by the U. S. Public Health Service to the University of Louisville School of Medicine. One grant of $5,635 will be used by Sheppard M. Walker, Ph.D., associate professor of physiology, to investigate the "chemical changes affecting the mechanical and electrical response of muscles," and the other of $9,400 was awarded Dr. Charles A. Woerner, associate professor of anatomy, for research in "the relation of fat metabolism to hardening of arteries."

LOUISIANA

New Surgical Society.—Surgeons of the medical schools of Tulane and Louisiana State universities have organized the New Orleans Surgical Society. Besides conducting scientific meetings, the group will make an annual trip to some other medical center. Officers elected to serve for the ensuing year are Dr. Alton Ochsner, president; Dr. James D. Rives, vice-president; Dr. Samuel A. Romano, treasurer; Dr. Marshall L. Michel, secretary; Dr. H. Reichard Kahle and George Burdette, members-at-large of the board of directors.

MICHIGAN

Research in Hematology.—A three-year grant to the Children's Hospital of Michigan in Detroit has been made by the Playtex Park Research Institute, New York, for the purpose of aiding research in certain phases of hematology. Dr. Julius Rutzky, New York, will carry out investigations in iron metabolism, prevention of iron deficiency anemia, and other hematologic problems under the direction of Dr. Wolfgang W. Zuelzer, director of laboratories for the hospital. Playtex Park Research Institute is a nonprofit, public service foundation sponsored by the International Latex Corporation for the support of research in the field of childhood diseases.

MINNESOTA

Personal.—Dr. Philip S. Hench and Edward C. Kendall, Ph.D., Rochester, were honored at a testimonial dinner November 29 at Coffman Memorial Union, University of Minnesota, Minneapolis. Each was presented with a special citation for distinguished service by the board of regents of the university. The ceremony was planned in conjunction with the nation-wide symposium on rheumatic fever held at the university.

State Rehabilitation Group.—The Minnesota Rehabilitation Association was formed at a recent meeting in Minneapolis to promote the welfare of the handicapped through improvement of standards of professional workers who serve them; encouragement of adequate facilities for treatment, education, and rehabilitation; education of the community to the problems of the handicapped; and sponsorship of programs that advance their welfare. Dr. Russell H. Frost, superintendent of Glen Lake Sanatorium, Oak Terrace, is president of the new group and Alice M. Christian, counselor of handicapped students at the University of Minnesota, is secretary.

NEW JERSEY

Shortage of Nurses Closes One Floor of Hospital.—Shortage of nurses was given as the reason for the announcement November 28 that one floor of the Margaret Hague Maternity Hospital at the medical center in Jersey City would close December 1. The closing would reduce the capacity of the hospital from 350 to 300 beds.

Hospital Unit for Alcoholics.—St. Michael's Hospital in Newark will open the first of the year a six-bed hospital unit for alcoholics. A fee of $85 will be charged for a five-day stay, three of actual treatment and two during which patients will see Alcoholics Anonymous members, who will supervise rehabilitation after patients are released.

---

hysicians are invited to send to this department items of news of general nterest, for example, those relating to society activities, new hospitals, ducation and public health. Programs should be received at least three weeks before the date of meeting.

NEW YORK

Personal.—Dr. Harry C. Storrs, Thiells, was honored at the annual luncheon of the Welfare League for Retarded Children November 24, for 40 years of service to the mentally retarded. Dr. Storrs has been associated with Letchworth Village for 21 of those years as senior director. Letchworth Village, an institution for the care and treatment of the mentally retarded, has 3,800 patients.

Medical College Appointments.—Dr. William L. Holt, assistant clinical professor of psychiatry at Harvard Medical School and associate in psychiatry at the Boston Psychopathic Hospital, has been appointed professor and director of the department of psychiatry at Albany Medical College and psychiatrist-in-chief to Albany Hospital. Dr. Thomas F. Frawley, formerly research fellow in medicine at Harvard Medical School and assistant in medicine at Peter Bent Brigham Hospital, Boston, has been appointed director of the section of endocrinology and metabolism, a newly created subdivision of the department of medicine. Prior to his Albany appointment, Dr. Frawley was associated with Dr. George W. Thorn at Harvard in studies of adrenal cortical physiology, corticotropin (ACTH), and cortisone.

New York City

Dean for Graduate Studies.—Dr. James E. McCormack has been appointed associate dean for graduate studies and assistant professor of medicine at Columbia University College of Physicians and Surgeons. Dr. McCormack has served in the United States Office of Scientific Research and Development with the Committee on Medical Research, and was executive director in 1948-1950 of the Committee on Medical Science of the Research and Development Board in the Department of Defense. He remains a consultant to the board. Dr. McCormack was associate in medicine at George Washington University in 1948. In 1950 he was appointed associate dean and assistant professor of medicine at the Post-Graduate Medical School of New York University. He has been on the visiting staff of Bellevue and University hospitals.

Home Care Program Saves City Funds.—Public health nurses of the department of health assigned to the home care service program of the city health and hospital departments have saved the city more than $750,000 in the first nine months of this year and have freed 220 beds for acutely ill patients in Queens General and Triboro hospitals, the Bureau of Public Health Nursing reported December 2. Most of the more than 300 patients cared for at home are older persons suffering from heart disease, cancer, and other long-term chronic illnesses. The home care program was inaugurated by the city health and hospital departments in November, 1948. In Queens in the first nine months of this year health department public health nurses made 11,147 home visits to patients who are under medical supervision of the Queens General and Triboro hospitals. Service given saved 51,482 patient-days in Queens General and 17,194 patient-days at Triboro in these months. Care for these patients in the hospitals for this time would have cost the city $801,684.80. The health department budgeted $46,880 for its work in the home care service program, but actually spent less on the program.

OKLAHOMA

Imposter Fined in Federal Court.—Conviction of James Allen Nolen, self-styled "M.D." and operator of Radium Springs Sanitarium, Salina, for shipping misbranded drugs was reported November 18 by the Food and Drug Administration, Federal Security Agency. Found guilty on 20 counts, Nolen was fined $2,000 and placed on a year's probation. The defendant treated patients in his bath house "sanitarium" and sent them home with various types of medicines, some worthless and others dangerous. Among the latter were concoctions containing sulfathiazole and habit-forming drugs, with no warning to protect the patient from injury. It was also brought out at the trial that Nolen instructed diabetics to stop the use of insulin, which he claimed was unnecessary if they took his medicines. As to Nolen's medical status, the U. S. attorney said that the defend ant had filed a license which showed the applicant to have bee born in 1842, although Nolen is obviously not now 109 yea old. He charged that the defendant had filed his father's licens four years after the latter had died. He also brought out th the defendant had been denied a license to practice medicine the Oklahoma State Board of Examiners. This application w based on Nolen's claim that he was licensed in 1906 by the chi of the Cherokee Indians.

PENNSYLVANIA

Plaques for Centenarians.—For the fifth consecutive year t Medical Society of the State of Pennsylvania will present fram testimonials to all residents of the state who attain their 100 birthday during 1952. The testimonial plaques have been p sented by officers of the various county medical societies to Pennsylvanians. Relatives, friends, and family doctors are urg to send the names and addresses of Pennsylvanians who w become 100 years old during 1952 to the Medical Society of State of Pennsylvania, 230 State St., Harrisburg.

Philadelphia

Personals.—Dr. Francis G. Harrison, associate professor urology, has been promoted to professor of urology and chi of the department at the Graduate School of Medicine, Univ sity of Pennsylvania, and urologist at the Graduate Hospital the University of Pennsylvania.

Hospital Trust Fund.—Jewish Hospital has been awarded trust fund of nearly $900,000, the income from which is to used for "some specific purpose" to be determined by the exec tor and hospital officials, according to the will of Martin Fran 90-year-old retired manufacturer of children's clothing, who di July 6. In his will Mr. Frank suggested that the money be us by the hospital for the erection of a wing or ward devoted the treatment of specific diseases or for scientific research. also bequeathed $500 to endow a room at the hospital memory of his parents.

Appointments at Jefferson Medical College.—The followi appointments at Jefferson Medical College became effective the beginning of the school year: Dr. David M. Davis becar emeritus professor of urology and Dr. Theodore R. Fetter w appointed Nathan Lewis Hatfield Professor of Urology a head of the department; Dr. James R. Martin, emeritus p fessor of orthopedic surgery, was appointed associate dean the college, and Dr. Robert Bruce Nye, who has been assista professor of medicine, became assistant dean. Dr. Martin Sokoloff was appointed acting director of the department diseases of the chest, succeeding Dr. Burgess Lee Gordon, wh resigned to accept the presidency of the Woman's Medic College of Philadelphia. Dr. Hobart A. Reimann's resignatio as the Magee Professor of Medicine and head of the departme of experimental medicine was accepted by the board of trustee effective October 15.

TEXAS

Child Development Center.—A number of Galveston Count and Texas agencies have cooperated to establish the Child D velopment Center for Galveston County. The new center wi have special quarters provided by the Galveston school system Funds for the initial effort have been given by the Hogg Foun dation for Mental Hygiene and by the Galveston County Crip pled Children Society. The Child Development Center will b under the direction of Dr. C. Christopher Morris, II, associat professor of pediatrics at the University of Texas Medica Branch, Galveston; Willie M. Verniaud, department of pedi atrics of the medical branch, will be clinical psychologist The Child Development Center will be operated in close co ordination with the teaching, research, and service activities o the department of pediatrics of the University of Texas Medica Branch, Galveston, under the general direction of Dr. Arild E Hansen, chairman. All Galveston County schools are cooperating in the new venture.

Southwest Texas Medical Assembly.—The International Medical Assembly of Southwest Texas will be held at the Municipal Auditorium in San Antonio, January 22-24, under the presidency of Dr. Thomas H. Sharp, San Antonio. The preliminary program ists the following speakers, most of whom will present at least four papers. Their names and the titles of one of their lectures are as follows:

Richard B. Cattell, Boston, Management of Hyperthyroidism.
Raymond W. McNealy, Chicago, Newer View of Large Bowel Surgery.
Dwight E. Harken, Boston, Recent Developments in Heart Surgery.
Henry L. Bockus, Philadelphia, Some Cardiovascular Gastrointestinal Interrelationships.
H. [illegible] r, Mich., Management of Upper Gastro- [illegible]
Rolland J. Whitacre, Cleveland, Practical Points in Anesthesia for the Part-Time Practitioner.
Vincente Pardo Castello, Havana, Cuba, My Experience with the Modern Treatment of Syphilis.
John C. Burch, Nashville, Tenn., Urological Injuries in Gynecological Surgery.
Newell W. Philpott, Montreal, Canada, Clinical Management of the Toxic Patient.
Phillips Thygeson, San Jose, Calif., Eye Manifestations of Dermatological Diseases.
Guy A. Caldwell, New Orleans, Minor Injuries of the Lumbar Spine and Coccyx.
Mercer G. Lynch, New Orleans, Causes of Hoarseness.
Malcolm B. Dockerty, Rochester, Minn., Modern Concepts Regarding Carcinoma of the Uterine Cervix.
Malcolm R. Hill, Los Angeles, Precancerous Lesions Encountered in Routine Anorectal Examination.
Edward B. Neuhauser, Boston, Diagnosis and Treatment of Malignant Disease in Children.
George F. Lull, Chicago, What Do I Get for My AMA Dues?
Paul V. Woolley Jr., Detroit, Familiar Problem of "Fever of Unknown Origin."
Lt. Col. Gerald M. McConnell, Washington, D. C., Evaluation of Atomic Weapons Casualties.

he registration fee of $20 may be mailed to the assembly, P. O. ox 2445, San Antonio.

UERTO RICO

Medical Association Program.—The Medical Association of uerto Rico held its annual meeting December 12-16 at its eadquarters in Santurce, under the presidency of Dr. A. Oliveras-Guerra. Guests of honor included the following physiians: Alton Ochsner, New Orleans; Richard A. Kern, Philaelphia; Walter Freeman, Washington, D. C.; Tinsley R. Harson, Birmingham, Ala.; Henry G. Poncher, Chicago; Henry J. umen, Philadelphia; Meredith F. Campbell, New York; Andrew . Banyai, Milwaukee; W. Guernsey Frey, Forest Hills, N. Y.; Maurice B. Visscher, Minneapolis; Max P. Cowett, New York; Arthur D. Ecker, New York, and Joe V. Meigs, Boston.

GENERAL

Dr. Brown Wins Dana Medal.—Dr. Edward V. L. Brown of Chicago is the 1951 winner of the Leslie Dana Medal, a national ward given annually for outstanding achievement in preventing lindness. Dr. Brown, senior attending ophthalmologist at Presbyterian Hospital, was selected for recognition by the Associaon for Research in Ophthalmology after being recommended y the National Society for the Prevention of Blindness. The t. Louis Society for the Blind annually awards the medal stablished in 1925 by Mr. Leslie Dana of St. Louis. The medal was presented to Dr. Brown at a dinner in the Hotel Chase, St. Louis, December 7. Dr. Brown formerly was professor of ophthalmology at both the University of Chicago and the Uniersity of Illinois. He is a member of the board of the Illinois Society for the Prevention of Blindness.

Group Psychotherapy Meeting.—The annual conference of the American Group Psychotherapy Association, formerly the American Group Therapy Association, will be held January 4-5 at the Hotel New Yorker in New York under the presidency of Dr. Lewis H. Loeser, Newark, N. J. In addition to papers to be presented, there will be panel discussions Friday on applications of group psychotherapy to prophylaxis, guidance and education; group psychotherapy in private practice, and group psychotherapy in mental hospitals and in child guidance, respectively. At the luncheon meeting on Saturday speakers will be Mrs. Clara Savage Littledale, editor, *Parents Magazine*, New York; Dr. Howard W. Potter, professor of psychiatry, State University of New York College of Medicine, and Dr. Lawson G. Lowrey, associate psychiatrist, Vanderbilt Clinic, Presbyterian Hospital, New York.

International Research Center for Chemical Microbiology.—This center was recently opened in Rome under the direction of Prof. E. B. Chain, F.R.S. It is attached to the Istituto Superiore di Sanità, the chief center for medical research and drug control of the Italian Government. A symposium on bacterial growth and its inhibition was held June 25-30 on this occasion, with the participation of some 20 scientists. The symposium was sponsored jointly by the Istituto Superiore de Sanità, the Council for the Coordination of International Congresses of Medical Sciences, and the World Health Organization. The center, which is recognized by WHO as an international center, will provide international research and training facilities in antibiotics. Its new laboratories contain large-scale pilot plant facilities for the production in substantial amounts of substances of microbiological origin and biochemical interest for research purposes.

Pathology Registry of Nutritional Diseases.—A registry of pathology of nutritional diseases has been established as a unit of the American Registry of Pathology of the Armed Forces Institute of Pathology in Washington, D. C., under the auspices of the Committee on Pathology of the National Research Council. The purpose of the registry is to provide for the accumulation and maintenance of pathologic materials and case records related to nutritional diseases. The registry will provide consultation service in the field of nutritional pathology and prepare teaching material for loan to qualified students and institutions. The cooperation of all individuals and institutions is invited. The registry has been authorized to receive any documented material sent by physicians, hospitals, laboratories, or other reliable sources. Further information may be secured from Dr. Herbert Pollack, 70 East 77th St., New York, or the Registry for Nutritional Pathology, Armed Forces Institute of Pathology, Washington, D. C.

Congress on Obstetrics and Gynecology.—The Fifth American Congress on Obstetrics and Gynecology will be held in Cincinnati March 31 through April 4 at the Netherland Plaza Hotel, sponsored by the American Committee on Maternal Welfare. More than 100 obstetricians and/or gynecologists are expected to take part in the program. In addition there will be 20 participants in the two public health meetings and more in the nursing section. Arrangements have been made for submission of written questions, either by mail or at the congress. The medical section program is headed by Dr. Woodard D. Beacham, New Orleans, in cooperation with the general program chairman, Dr. Nicholson J. Eastman, Baltimore. Chairman of the public health section is Dr. Herman N. Bundesen, Chicago. Congress registration fees are $5 for members and $10 for nonmembers. Information can be obtained by writing to Mr. Donald F. Richardson, Executive Secretary, American Committee on Maternal Welfare, 116 South Michigan, Chicago 3.

Postgraduate Course in Anesthesiology.—The New England Society of Anesthesiologists has arranged six postgraduate lectures in anesthesiology. The mornings will be devoted to visits to Boston hospitals, followed by roundtable luncheon discussions at the Massachusetts General Hospital at 12:30 p. m. Afternoon lectures will be held in the Bigelow Auditorium of Massachusetts General Hospital at 2 p. m. Fee for the course is $5. Residents and medical students will be admitted without fee. The lectures are as follows:

January 5, Physiology of the Cardiovascular System and Its Relationship to Anesthesia, moderators: Dr. William S. Derrick, Boston, and Dr. John Abajian, Burlington, Vt., Discussion of Cardiac Surgery.
February 2, Physiology of the Respiratory System and Its Relationship to Anesthesia, moderators: Dr. William Martin, Worcester, and Dr. Ruth E. Anderson, Norwich, Conn., Discussion of Pulmonary Surgery.
March 1, Physiology of the Central Nervous System and Its Relationship to Anesthesia, moderators: Dr. Julia G. Arrowood, Boston, and Dr. John R. Lincoln, Portland, Maine. Discussion of Neurosurgery.
April 5, Physiology of the Metabolic System and Its Relationship to Anesthesia—including a discussion of kidney and adrenal surgery, moderators: Dr. Benjamin E. Etsten, Boston, and Dr. M. Gene Black, Holyoke, Mass.
May 3, Gynecology and Obstetrics and Their Relationship to Anesthetic Agents, moderators: Dr. Elihu Saklad, Providence, R. I., and Dr. Richard H. Barrett, Hanover, N. H.

For information address M. Gene Black, M.D., Chairman, Committee on Post Graduate Education, 575 Beech St., Holyoke, Mass.

DEATHS

Aycock, William Lloyd ⊕ Boston; born Feb. 25, 1889; University of Louisville (Ky.) Medical Department, 1914; associate professor of preventive medicine and hygiene at Harvard Medical School; formerly on the faculty of Harvard Medical School, Courses for Graduates; for many years in charge of the laboratories and field investigations of the Harvard Infantile Paralysis Commission; on the faculty of the Harvard School of Public Health; at one time professor of tropical medicine at the University of Vermont College of Medicine in Burlington, where he was from 1919 until 1931 director of the research laboratory of the Vermont State Board of Health; instructor in bacteriology at the New York Post-Graduate Medical School and Hospital in New York from 1915 to 1919; during World War I served as officer in charge of a base hospital laboratory and as epidemiologist for the American Expeditionary Forces; member of the Association for the Study of Internal Secretions, American Public Health Association, and the Society of American Bacteriologists; past president of the American Epidemiological Society; died in Boston City Hospital October 24, aged 62, of subarachnoid hemorrhage.

Gibson, Edward Thomas ⊕ Kansas City, Mo.; born in Kansas City, Kan., Jan. 17, 1881; University of Kansas School of Medicine, Kansas City, 1912; professor of psychiatry and neurology at his alma mater, where he had been chairman of the department from 1929 to 1947; from 1914 to 1916 taught in the depart of neuropathology and psychiatry at Harvard Medical School in Boston and was assistant physician at Boston Psychopathic Hospital; specialist certified by the American Board of Psychiatry and Neurology; an Associate Fellow of the American Medical Association; one of the founders of the Mental Hygiene Society in Kansas City; member of the American Psychiatric Association, Central Neuropsychiatric Association, Kansas City Academy of Medicine, and Kansas City Southwest Clinical Society; affiliated with Mercy Hospital, of which he had been staff president, St. Luke's, Research, and Neurological hospitals in Kansas City, Mo., and the University of Kansas Medical Center in Kansas City, Kan.; from 1916 to 1920 clinical director and pathologist at Connecticut State Hospital in Middletown; consultant in psychiatry for the U. S. Public Health Service; died October 18, aged 70.

Carter, Harold Robert ⊕ Captain, U. S. Army, retired, Denver, born in Battle Creek, Mich., April 11, 1907; College of Medical Evangelists, Los Angeles, 1932; entered the medical corps of the U. S. Army as a first lieutenant in August, 1937, and retired in October, 1942; certified by the National Board of Medical Examiners; specialist certified by the American Board of Psychiatry and Neurology; member of the Central Neuropsychiatric Association, American Psychosomatic Society, American Psychiatric Association, and American Academy of Neurology; fellow of the American College of Physicians; assistant professor of neurology (medicine) at the University of Colorado School of Medicine; affiliated with Denver Orphanage, National Jewish, Presbyterian, St. Luke's, Colorado General, Denver General, and Children's hospitals and Mount Airy Sanitarium; killed in an automobile accident October 28, aged 44.

Milkman, Louis Arthur ⊕ Scranton, Pa.; born in 1895; Temple University School of Medicine, Philadelphia, 1919; specialist certified by the American Board of Radiology; member of the Radiological Society of North America and the American College of Radiology; fellow of the American College of Physicians; past president of the Pennsylvania Radiological Society and the Lackawanna County Medical Society; at one time on the faculty of St. Thomas College, now known as the University of Scranton; served during World War I; impartial physician, occupational diseases, Pennsylvania State Department of Labor and Industry, Workmen's Compensation Board; roentgenologist for the Pennsylvania Tuberculosis Clinic; affiliated with Carbondale (Pa.) General Hospital, Clarks Summit (Pa.) State Hospital, West Side Hospital, and Mercy Hospital, where he died October 25, aged 56, of myocardial infarction.

Acker, William F., Monroe, Mich.; Detroit College of Medicine, 1901; member of the American Medical Association; served during World War I; for many years county physician; formerly city physician; served as chief-of-staff at Mercy Hospital; died in the University Hospital, Ann Arbor, November 9, aged 72 of bronchopneumonia.

Asper, Guy Philip, Chambersburg, Pa.; University of Maryland School of Medicine, Baltimore, 1903; formerly associated with the U. S. Public Health Service Reserve; served during World War I; for several years on the staff of the Veterans Administration Facility in Castle Point, N. Y.; died recently, aged 71, of arteriosclerotic heart disease.

Bagnulo, Edmund Gillis, Pittsfield, Mass.; Tufts College Medical School, Boston, 1935; plant physician at General Electri Company; member of the American Medical Association; affiliated with St. Luke's Hospital and Hillcrest Hospital, wher he died October 23, aged 42, of carcinoma of the colon.

Blake, James ⊕ Hopkins, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1901; an Associat Fellow of the American Medical Association; served on th staffs of St. Mary's, Eitel, and Maternity hospitals in Minneapolis; died October 28, aged 79, of arteriosclerotic hear disease.

Bowman, Dora Emma, La Grange, Ill.; College of Physician and Surgeons, Medical Department of Kansas City University Kansas City, Kan., 1901; died in Iola, Kan., August 30, aged 82, of injuries received in an automobile accident.

Broadbelt, Leedom Richard, Havertown, Pa.; Jefferson Medical College of Philadelphia, 1906; member of the America Medical Association; on the staff of Delaware County Hospita in Drexel Hill October 13, aged 67.

Burger, Harry Ernest, Beloit, Wis.; Northwestern Universit Medical School, Chicago, 1907; member of the American Medcal Association; served during World War I; died July 27, age 67, of coronary infarct and carcinoma of the hepatic colon wit metastases to the lungs.

Clark, Perry Jacob, Powell, Wyo.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1883; served o the staff of Memorial Hospital; died October 10, aged 91, o arteriosclerosis.

Cook, Orrin Simeon ⊕ Sacramento, Calif.; University of Calfornia Medical School, San Francisco, 1917; specialist certifie by the American Board of Radiology; member of the America Roentgen Ray Society, Radiological Society of North America and the American College of Radiology; served during World War II; for 25 years chief radiologist at Mercy Hospital, where he died October 24, aged 59, of carcinoma of the stomach with metastasis.

Corson, Filbert Richard ⊕ Atlantic City, N. J.; Medico-Chirurgical College of Philadelphia, 1913; served during World Wa I; died in Beesleys Point, October 13, aged 61, of cerebral hemorrhage and coronary occlusion.

Crist, Damon Ambrose, Dayton, Ohio; Ohio State University College of Medicine, Columbus, 1917; member of the American Medical Association; died October 7, aged 62, of Banti's disease.

Crocker, Elvis Wayne, Calhoun City, Miss.; University of Tennessee College of Medicine, Memphis, 1940; member of the American Medical Association; served during World War II; killed September 30, aged 42, in an automobile accident.

Cruzen, John Lewis, Barnes City, Iowa; the Hahnemann Medical College and Hospital, Chicago, 1899; member of the American Medical Association; served during World War I; died September 16, aged 75, of carcinoma of the gallbladder and liver.

⊕ Indicates Fellow of the American Medical Association.

DeLong, Charles Alanson, Gary, Ind.; Rush Medical College, Chicago, 1905; member of the American Medical Association; on the staffs of Mercy Hospital and Methodist Hospital, where he died October 23, aged 77, of nephrosclerosis and uremia.

Dickey, Robert Randolph, Minneapolis; Minneapolis College of Physicians and Surgeons, medical department of Hamline University, 1909; died October 28, aged 68, of cerebral hemorrhage due to hypertension.

Dowd, James Henry, Buffalo; Niagara University Medical Department, Buffalo, 1890; member of the American Medical Association; died October 29, aged 86, of arteriosclerosis.

Dowdy, Thomas Winfield ⊕ Oklahoma City; Fort Worth School of Medicine, Medical Department of Texas Christian University, 1912; at one time practiced in Wilson and was past president of the Carter County Medical Society; affiliated with Mercy and Polyclinic hospitals; died in Wesley Hospital October 10, aged 62, of gastrointestinal hemorrhage, peptic ulcer and arteriosclerosis.

Driver, Wilson Eliot, Norfolk, Va.; University of Maryland School of Medicine, Baltimore, 1893; fellow of the American College of Surgeons; member of the staff of the Hospital of St. Vincent de Paul and Leigh Memorial Hospital; one of the founders of the Norfolk General Hospital; died October 14, aged 81, of coronary sclerosis.

Duckering, Florence West, St. Petersburg, Fla.; Tufts College Medical School, Boston, 1901; member of the American Medical Association; fellow of the American College of Surgeons; formerly practiced in Boston, where she was consulting surgeon to the New England Hospital for Women and Children; died in Peterboro, N. H., October 25, aged 81, of abdominal carcinomatosis.

Forcey, Charles Budd ⊕ Sewickley, Pa.; Jefferson Medical College of Philadelphia, 1910; in 1929 member of the House of Delegates of the American Medical Association; died in Miller Hospital, St. Paul, Minn., October 26, aged 65.

Galbraith, Alexander ⊕ Palo Alto, Calif.; Rush Medical College, Chicago, 1899; an Associate Fellow of the American Medical Association; member of the Pacific Coast Oto-Ophthalmological Society; fellow of the American College of Surgeons; served on the staff of the Samuel Merritt Hospital in Oakland; was cited by President Truman for his work with the Selective Service system during World War II; died in Oakland October 13, aged 80.

Gerson, Benjamin Norton, St. Louis; National University of Arts and Sciences Medical Department, St. Louis, 1917; died October 17, aged 68, of hypertension and heart disease.

Gill, John Richard, Lovelock, Nev.; Minneapolis College of Physicians and Surgeons, medical department of Hamline University, 1900; member of the American Medical Association; served as mayor and as city and county health officer; veteran of the Spanish-American War; formerly associated with the Indian Service; died in Pershing County General Hospital, October 13, aged 77, of heart failure.

Goldman, Louis Charles ⊕ Ventnor, N. J.; Jefferson Medical College of Philadelphia, 1909; died in Atlantic City (N. J.) Hospital October 22, aged 65, of brain tumor.

Graham, Thomas Everett, St. Louis; Barnes Medical College, St. Louis, 1904; died in Missouri Baptist Hospital October 13, aged 74, of heart disease.

Gray, Richard Berchmans, Rensselaer, N. Y.; Albany (N. Y.) Medical College, 1910; served as health officer; died October 27, aged 63, of a skull fracture received in an automobile accident.

Grove, Robert Kellogg, Buffalo; Cornell University Medical College, New York, 1899; affiliated with Mercy and Charity Eye, Ear, and Throat Hospital of Erie County; died October 30, aged 76, of cerebral hemorrhage.

Growney, George Moore Jr. ⊕ Rochester, N. Y.; University of Buffalo School of Medicine, 1929; served during World War I; on the staff of St. Mary's Hospital; died in Elmira September 29, aged 51, of coronary occlusion.

Halderman, Charles Austin, Tipp City, Ohio; Ohio State University College of Medicine, Columbus, 1910; member of the American Medical Association; served as county health commissioner; for many years member of the county board of health; affiliated with Good Samaritan Hospital and the Miami Valley Hospital in Dayton, where he died October 23, aged 73.

Harney, Earl Lafayette ⊕ St. Petersburg, Fla.; Starling-Ohio Medical College, Columbus, 1911; member of the Ohio State Medical Association; died September 27, aged 65, of chronic myocarditis.

Hartzell, Thomas Bradford, Minneapolis; University of Minnesota College of Medicine and Surgery, Minneapolis, 1894; held a D.D.S. degree; member of the American Medical Association; past president of the American Dental Association; formerly on the faculty of his alma mater and the graduate school; affiliated with Northwestern Hospital; member of the medical section of the National Research Council; died in Jennings Memorial Hospital in Detroit August 26, aged 85, of coronary thrombosis.

Haschec, Walter ⊕ Newark, N. J.; Long Island College of Medicine, Brooklyn, 1937; died September 19, aged 41, of portal cirrhosis.

Hays, Hardie Rogers, Jackson, Miss.; Memphis (Tenn.) Hospital Medical College, 1906; member of the American Medical Association; served during World War I; formerly associated with the U S. Public Health Service; for many years member of the county health department; director of the bureau of communicable diseases for the state board of health from 1926 to 1928; on the staff of the Baptist Hospital; died October 22, aged 69.

Heaton, Elbert Ellsworth, Centerville, Iowa; College of Physicians and Surgeons, Keokuk, 1896; died September 4, aged 79, of diabetes mellitus.

Herman, Howard Hunter, Waynesville, Ohio; Cleveland University of Medicine and Surgery, 1897; fellow of the American College of Surgeons; past president of the Montgomery County Medical Society; for many years on the staff of Miami Valley Hospital in Dayton, where he died October 21, aged 79.

Hertzog, Lucy Stone ⊕ Chardon, Ohio; Homeopathic Hospital College, Cleveland, 1891; affiliated with Huron Road Hospital in Cleveland, where he died August 12, aged 81, of cerebral hemorrhage.

Higgins, Clarence Bertrand, South Easton, Mass.; Middlesex College of Medicine and Surgery, Cambridge, 1918; served on the staff of Harley Private Hospital in Boston; member of the American Medical Association; died September 20, aged 63.

Hilton, George Libby, Nashua, N. H.; College of Physicians and Surgeons, Baltimore, 1902; practiced in Bangor, where he served as city physician and as a member of the police commission and the board of health; died October 9, aged 75.

Hogan, John Vincent, Niagara Falls, N. Y.; University of Buffalo School of Medicine, 1910; member of the American Medical Association; affiliated with Memorial Hospital and Mount St. Mary's Hospital, where he died October 20, aged 63, of cerebral thrombosis and cirrhosis of the liver.

Honeycutt, Emery Highsmith, Miami, Fla.; Medical College of Virginia, Richmond, 1950; intern, Jackson Memorial Hospital; died in Clinton, N. C., July 13, aged 27, of carcinoma of the abdomen.

Hyde, Ximie Richard, Fort Worth, Texas; Fort Worth School of Medicine, Medical Department of Texas Christian University, 1915; member of the American Medical Association; specialist certified by the American Board of Radiology; formerly vice-president of the State Medical Association of Texas; past president and secretary of the Tarrant County Medical Society; member of the Radiological Society of North America and the American College of Radiology; affiliated with City-County Hospital; died recently, aged 58.

Isar, Jakob, Kew Gardens, L. I., N. Y.; Rheinische Friedrich-Wilhelms-Universität Medizinische Fakultät, Bonn, Prussia, Germany, 1915; died recently, aged 61, of arteriosclerotic heart disease.

Keene, Jacob Jay, Brooklyn; Long Island College Hospital, Brooklyn, 1903; died in Adelphi Hospital July 18, aged 80, of congestive heart failure.

Kohlhas, John Joseph ⊕ Buffalo; University of Buffalo School of Medicine, 1912; veteran of the Spanish-American War and World War I; died October 31, aged 67, of lymphosarcoma of the rectum.

Kress, William Jewett ⊕ Spokane, Wash.; Missouri Medical College, St. Louis, 1894; an Associate Fellow of the American Medical Association; died in the Santa Monica (Calif.) Hospital October 28, aged 78.

Law, Stanley Guy ⊕ Minneapolis; Rush Medical College, Chicago, 1930; member of the American Psychiatric Association and Industrial Medical Association; served during World War II; died near Siren, Wis., September 3, aged 49, of coronary thrombosis.

Lawrence, Watson Angus, Hartsdale, N. Y.; McGill University Faculty of Medicine, Montreal, Canada, 1909; served during World War I; for many years director of obstetrics at St. Agnes Hospital in White Plains; died November 5, aged 73, of heart disease and cirrhosis of the liver.

Lof, Anders Johan Oscar, Denver; University of Denver Medical Department, 1896; member of the American Medical Association; died October 5, aged 84, of hypostatic pneumonia, arteriosclerosis, and fracture of the femur.

Lynch, George David, DeWitt, N. Y.; Syracuse University College of Medicine, 1904; member of the American Medical Association; served as medical examiner for the New York State Department of Labor Compensation Bureau; formerly on the faculty of his alma mater; died October 13, aged 71.

McCoy, Earl Monroe, Central Islip, N. Y.; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1918; member of the American Medical Association; past president of the Suffolk County Medical Society and vice-president of the Long Island Associated Physicians; served during World War I; affiliated with Southside Hospital, where he died November 9, aged 56, of injuries received in an automobile accident.

McCoy, Raymond Howard, Tecumseh, Neb.; University of Nebraska College of Medicine, Omaha, 1948; member of the American Medical Association; served during World War II; died July 3, aged 26, of coronary thrombosis and poliomyelitis.

McNair, John Clement, Handsboro, Miss.; Medical Department of Tulane University of Louisiana, New Orleans, 1898; at one time county health officer; served during World War I; superintendent of the Natchez (Miss.) Charity Hospital from 1924 to 1928; died October 16, aged 79, of bronchiectasis and cardiovascular disease.

Macy, Otto E., Riverton, Wyo.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1899; died September 27, aged 80, of coronary thrombosis.

Maguire, Thomas Joseph, Medford, Mass.; Harvard Medical School, Boston, 1907; member of the American Medical Association; school physician and medical inspector for the board of health; on the staff of Lawrence Memorial Hospital; died October 10, aged 73, of uremia.

Marbel, Myer M. ⊕ Chicago; Chicago College of Medicine and Surgery, 1917; on the staff of the American Hospital, where he died November 19, aged 65, of ileus.

Markowitz, Irwin ⊕ Jersey City, N. J.; University and Bellevue Hospital Medical College, New York, 1915; specialist certified by the American Board of Urology; member of the American Urological Association; fellow of the American College of Surgeons; served overseas during World War I; on the staff of Christ Hospital and Margaret Hague Maternity Hospital; died October 20, aged 57.

Marshall, William R. ⊕ Aspinwall, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1922; served during World War I; school doctor; formerly on the faculty of the University of Pittsburgh School of Medicine in Pittsburgh, where he was affiliated with Mercy Hospital; died recently in Dunnville, Ont., Canada, aged 54, in a plane crash.

Mitchell, James Creighton, Charleston, S. C.; Medical College of the State of South Carolina, Charleston, 1890; member of the American Medical Association; served during World War I; died October 25, aged 87, of arteriosclerosis.

Molyneaux, Silas David ⊕ Binghamton, N. Y.; University of Pennsylvania Department of Medicine, Philadelphia, 1908; fellow of the American College of Surgeons; served during World War I; affiliated with Our Lady of Lourdes Memorial Hospital and Binghamton City Hospital, where he died October 14, aged 72, of myocardial infarction.

Moore, Homer Jackson ⊕ Surgeon, Lieutenant Commander, U. S. Navy, retired, Opa-Locka, Fla.; University of Texas School of Medicine, Galveston, 1941; served during World War II; retired in May, 1949; on the staff of North Dade Hospital; died in Jackson Memorial Hospital, Miami, September 28, aged 40, of peritonitis, hemorrhages, and pancreatic necrosis.

Nelson, Henry Walker ⊕ Ogden, Utah; Rush Medical College, Chicago, 1914; fellow of the American College of Surgeons; past president of the Weber County Medical Society; served during World War I; affiliated with Thomas D. Dee Memorial Hospital and St. Benedict's Hospital; died October 15, aged 69, of arteriosclerosis.

Nixon, Jesse Elsworth, Portland, Ind.; Medical College of Indiana, Indianapolis, 1904; member of the American Medical Association; served as county health officer; died in Jay County Hospital September 21, aged 76, of cerebral hemorrhage.

Peterson, Carl Adrian Rudolf ⊕ New York; Tufts College Medical School, Boston, 1920; on the staffs of the Columbus and St. Clare's hospitals; died October 28, aged 55.

Pillsbury, Edward Andrew ⊕ Frankenmuth, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; veteran of the Spanish-American War; on the associate staffs of St. Luke's, St. Mary's, and Saginaw General hospitals; charter member of the Frankenmuth State Hospital, of which he was a director; died October 9, aged 74.

Seyfarth, Clarence Alexander, Los Angeles; Northwestern University Medical School, Chicago, 1906; died in Methodist Hospital October 21, aged 70, of carcinoma of the liver.

Short, Nathan Green, Chicago; the Hahnemann Medical College and Hospital, Chicago, 1906; for many years a staff member of the city board of health; died in St. Luke's Hospital October 26, aged 76, of injuries received in a fall.

Wade, John Christopher, Oconto, Neb.; Sioux City (Iowa) College of Medicine, 1897; served during World War I; died in Sioux City, Iowa, September 27, aged 81.

Winslow, Benjamin Sabert, New Bedford, Mass. (licensed in Massachusetts in 1902); member of the American Medical Association; on the courtesy staff of St. Luke's Hospital, where he died November 2, aged 74, of coronary occlusion.

Yowell, Joseph William, Duvall, Wash.; University of Louisville (Ky.) School of Medicine, 1929; member of the American Medical Association; died September 21, aged 54, of coronary occlusion.

DIED WHILE IN MILITARY SERVICE

Dillon, Henry Joseph, Denver; University of Colorado School of Medicine, Denver, 1937; member of the American Medical Association; served during World War II; lieutenant colonel in the medical reserve corps of the U. S. Army, served with the 8,040th Army Unit in Nara, Japan, where he died August 14, aged 49, of a hemorrhage following an accident.

FOREIGN LETTERS

DENMARK

The Hospital Ship "Jutlandia."—With its return to Europe carrying wounded and convalescent soldiers, "Jutlandia" has completed an Odyssey that is Denmark's first official contribution to the United Nations. In his report to the Danish National Red Cross Society, Dr. Hans Tønnesen emphasizes the spirit of teamwork shown by his staff. Surgeons, physicians, psychiatrists, and neurologists set an example in collective action. By the end of June, 1951, some 1,200 casualties had been treated by the hospital ship staff, which had a lighter task than it had expected. It was from time to time free to extend the hospitality of the ship's services to colleagues from hospitals ashore and from other hospital ships, and these meetings provided an opportunity for discussing general principles of treatment and specific cases. Visits from the Americans were particularly important, since it was necessary to fit "Jutlandia" into an organization working smoothly with the fighting line at one end and the hospitals in Tokyo, Yokosuka, and the homeland at the other.

Dr. Tønnesen stresses the importance he has learned to attach o disciplined uniformity in place of undisciplined individualism. It had been feared at the outset that it might be difficult to get physicians from different fields to work harmoniously, but the staff succeeded in achieving a spirit of cooperation. According o the original plan, "Jutlandia" was to receive non-American United Nations contingents from the British Dominions and other countries, but most of the wounded men were Americans. The language differences gave some trouble, particularly Turkish and Greek. Dr. Tønnesen attributes much of the high morale of his patients to the fact that they were cared for by nurses nstead of by orderlies. Though the nurses had to live four to each bedroom, they managed to maintain a cheerful spirit at all imes. They worked for 8 to 10 hours a day in artificial light and a strenuous atmosphere. From time to time they took excursions ashore, from which they returned with flowers for their patients. At times, when the requirements of the wounded were not pressing, Korean adults and children were given medical reatment on board the ship, which flew the flags of Denmark, of the Red Cross, and of the United Nations.

Cure for Adiposity by Taxation.—At the central hospital in Svendborg, Dr. Bent Krarup and Dr. C. J. Schwensen have undertaken an analytical study of the weight of patients treated n this hospital in 1948 and 1949. After the elimination of 569 patients under the age of 15 and 147 other patients, they were eft with 2,429 patients over the age of 15. They were classified according to their ages and weights, and the "normal" weights at different ages were based on the figures of a life insurance company. These life insurance "normals" could not be regarded as the ideal, particularly for elderly persons, being based on average values. So the patients were allowed a 10% margin above these normals before being included among the overweight cases. According to this standard, 310 (12.8%) of the 2,429 patients were overweight. About two-thirds of these patients were over the age of 50. A study of 242 overweight patients showed that on the average each of them had spent nearly five days more in a hospital than the average for all the hospital patients. These 242 patients had been admitted to the hospital for reasons directly or indirectly, partly or entirely, concerned with their obesity. As many as 85 suffered from arthroses, and 141 from some form of heart disease. After discussing the association of adiposity with numerous other morbid conditions and the economic burden it imposes on the community, the authors of this study suggest that it is largely due to the carelessness and thoughtlessness of overweight persons. These persons, they said, should defray some of its cost through taxation on adiposity; those who were overweight would have to pay an extra premium for their insurance.

A Pernicious Anemia Census.—In 1939, Kirk and Geert-Jørgensen attempted a pernicious anemia census in Denmark, whose population is 4 million persons. They calculated that there were about 2,000 patients over the age of 65 in the country. Among 2,079 persons over the age of 60 whose blood they examined, there were 19 cases of pernicious anemia. In 1934 Meulengracht estimated that the number of such cases in Denmark was between 1,000 and 2,000. Dr. Johannes Mosbech has now taken up the same problem with the help of the U. S. Public Health Service. A member of the Institute for Genetics and Biology, University of Copenhagen, Dr. Mosbech has issued a questionnaire on the subject of pernicious anemia to 94 physicians in the county of Odense. All but two answered, giving the number of their pernicious anemia patients under treatment in December, 1950.

The 175 cases thus reported (105 women and 70 men) may be taken to include all the known cases in the county, for these physicians are able to keep in touch with all their patients, because their signatures are necessary for the renewal of prescriptions for pernicious anemia remedies. About one-third of the 175 cases had been diagnosed while the patients were in the hospital, and in 169 cases data were available with regard to the patient's age when the disease was first detected. It was found that the disease began most frequently among women between the ages of 50 and 60 and among men between the ages of 40 and 70. No seasonal variation could be discovered with regard to the time of the year at which the disease was diagnosed.

As far as the county of Odense is concerned, the pernicious anemia rate is put at about 0.1%. This rate increases with age: between the ages of 40 and 60 it is about 0.2%, and between the ages of 60 and 80 it is about 0.3%. If the findings for Odense are applied to the whole of Denmark, there would seem to be, at the present time, about 4,000 patients receiving treatment for pernicious anemia. In Odense alone about 15 new cases are diagnosed every year—a new case for every 10,000 women and for every 15,000 men, and in the whole of Denmark about 300 new cases are diagnosed yearly. Dr. Mosbech, whose study is published in *Ugeskrift for Laeger* for Sept. 27, 1951, concluded: "The present study has shown that in Denmark during the 25 years since treatment was introduced, there must be 4,000 patients who suffer from pernicious anemia and who benefit from the therapeutic advance made by Minot and Murphy."

TURKEY

Drug Addiction in Turkey.—Before World War I drug addiction was rarely encountered. With the influx of Russian refugees in 1919, drug addiction, mostly to cocaine, appeared and spread. During the occupation, 1918-1923, it was difficult to curb illicit traffic in narcotics, and it became necessary to set aside a pavilion for the treatment of drug addicts at the Istanbul-Bakirköy mental hospital.

According to a publication by Prof. Fahreddin Kerim Gökay, formerly of Istanbul University Department of Psychiatry, for many years chief of Bakirköy's 3,000-bed mental hospital, and currently governor and mayor of Istanbul, 1,534 patients, of whom 1,442 were men and 92 were women, were treated for drug addiction between 1940 and 1949. The ages of these patients were 15 to 19 in 7% of the cases, 20 to 34 in 56%, and 35 to 50 in 37%. Seventy-one per cent were addicted to heroin, 7% to hashish, 4% to opium, and 1% to morphine; the remaining 17% were addicted to various other kinds of narcotics. Of these patients 52% were unemployed or transient trades persons, 16% were workmen, 11% technicians, 7% car and truck drivers, 5% prostitutes, 3.5% housewives, 3% civil servants, 1.5% entertainers, and 1% students. Of all these, 32% were chronic drug addicts and 68% had taken drugs regularly for only a short time.

The control of narcotics is the concern jointly of the Ministry of Health and Social Assistance and the Ministry of Agriculture. The cultivation of opium and Cannabis indica is re-

---

The items in these letters are contributed by regular correspondents in the various foreign countries.

stricted, and the manufacture of heroin and cocaine is prohibited by law. The government controls the sale and export of raw opium. Smuggled narcotics are confiscated, and high fines and severe prison sentences await the offenders. Confiscated narcotics are immediately sealed and forwarded to the Ministry of Health for destruction (by incineration) under the supervision of a special body. Depots of drugs and narcotics, pharmacies, and drug stores are required by law to keep a book of accounts of the narcotics dispensed. The accounts are inspected by officers from the Ministry of Health at intervals. The maximum amount of drugs and narcotics a physician may prescribe is fixed; the daily dose prescribed is not to surpass half the amount of the maximum dose of any drug, and it may not be prescribed for more than five days, with the exception of codeine and ethylmorphine hydrochloride, for which pharmacists need not account. Proprietors of commercial pharmaceutic houses selling narcotics to persons other than pharmacy proprietors, and pharmacists guilty of dispensing narcotics without prescription, or who are guilty of faulty bookkeeping, are fined from £100 to £1,000 and sentenced to prison. Physicians, nurses, sanitary inspectors, midwives, or members of allied professions found guilty of violating the narcotics law are fined from £200 to £1,000 and sentenced to prison for two years; they are sentenced to five years in a penitentiary if death has occurred as a result of the violation. The licenses of those persons are temporarily, or permanently, withdrawn. The government is trying to control illicit production and traffic of narcotics by increasing its staff of officers and cooperating with international bodies for drug control.

Training School for Tuberculosis Nurses.—As a consequence of World War II, tuberculosis is now first in importance among public health problems in Turkey. The Ministry of Health and Social Assistance, in cooperation with the World Health Organization and the Turkish Anti-Tuberculosis Society, endeavors to train medical and health workers in modern antituberculosis methods. The first training school for tuberculosis nurses, with an enrolment of 30 students, was established in 1943, in temporary premises at the Istanbul Antituberculosis Society's 200-bed Istanbul-Erenköy Sanatorium. The training course was two years. As the Ministry of Health and Social Assistance had in recent years added 2,000 beds for tuberculous patients in its hospitals and sanatoriums, the need for more tuberculosis nurses became apparent. The new school building for the training of tuberculosis hospital and visiting nurses, with an enrolment of 100 students, was recently opened in ceremonies attended by the Minister of Health, Prof. Ekrem Hayri Üstündag, and Antituberculosis Association President Prof. Tevfik Saglam, Dr. Étienne Berthet, tuberculosis consultant of the WHO, and other prominent tuberculosis workers. The theoretical and practical course now takes three years; board, maintenance, and tuition are free; among the teaching staff are American and specialist nurses. The students study at the expense of either the Ministry of Health or the Antituberculosis Society and must work for a period of five years after termination of the course in the respective hospitals or institutions. After this period they must still continue in this branch of nursing.

ECUADOR

National Antimalarial Campaign in Ecuador.—As in other tropical countries, in Ecuador the incidence of malaria has been great. Moreover, malaria has been distributed solely through the lowlands: the coast, certain subtropical valleys, and to a lesser extent in the eastern zone, which forms part of the Amazon basin. The mountain zone, in which, owing to its favorable climate, the greater percentage of persons is found, has always been exempt from malaria, because the carrier mosquito, the Anopheles, can not adapt to the temperate climate of the mountains. However, the most important region, from an economic point of view, is the coast, where the majority of the exportable items and commodities are produced, such as rice, cacao, rubber, bananas, and balsa wood. In this region, according to mortality statistics, more than 10% of the deaths were caused by malaria. Thus, the number of those affected by the parasites must have been extremely large. More than 50% of the agricultural workers of the coast either were sick or had been sick with malaria, which reduced their output to such an extent that the national economy was affected.

These considerations led the National Congress to study a plan for a systematic campaign designed to eradicate malaria in Ecuador, and for this purpose it passed a law that was put into effect in 1949. This national campaign was directed by the eminent epidemiologist Dr. Juan Antonio Montalván, who had, a short time before, carried on specialized studies in the United States. The campaign was planned for completion in three years and its purpose was to destroy the infected mosquitoes and introduce control of the patients with malaria, so that, within tha period of time, the disease would be eradicated. The antimalaria campaign, which has proceeded according to plan, has consisted essentially of spraying with D. D. T., at six month intervals, al the houses and habitations in all malaria-infested places. In addition, the appropriate controls have been instituted over malaria patients. The first general spraying with D. D. T. took place at th end of 1949 and reached approximately 80% of the dwellings i malaria-infested places; that is, 32,000 urban houses and 71,50 rural houses, with a total of more than 25 million square meters which were sprayed with solutions and powders of D. D. T. an gamma benzene hexachloride ("gammexane") (this last insecticide in small proportion). This treatment reached 700,000 inhabitants in the cities and in the rural regions. The subsequen treatments with D. D. T. reached an even greater percentage o houses. The spraying with D. D. T., which in the first gener treatment had been carried out only to the height of 11 ft. o walls that were higher than that, was in subsequent treatment carried out completely, including the roofs and subfoundations In accordance with the original intention, the antimalarial campaign is drawing to an end; nevertheless, an extension will b necessary for some time to control any possible focus of infectio that may appear in the future.

The results of the campaign have been most interesting an effective. The relevant statistics disclose an abrupt diminutio in the incidence of malaria, beginning with the start of this campaign and a progressive diminution during the last two year showing a tendency to fall to zero. The greatest contrast is observed on comparing the statistics before 1949 with those fo lowing the first general treatment with D. D. T. Thus, f example, in investigations prior to treatment with D. D. T., was found that during the period of malarial transmission, that i from December to May, 22% of the samples, chosen at random contained plasmodia; while, in 18,300 samples, also chosen random but after the D. D. T. treatment, only 2.2% of parasit infection was found. In another investigation carried out at t Dispensario Infantil of Guayaquil, where the incidence malaria was great, after the treatment with D. D. T. it was foun that out of 2,778 blood samples, only 29 (1.04%) containe the malarial parasites. In the Luis Vernaza Hospital of Guayaquil, where the majority of the patients, not only from the city but also from most of the coast, are concentrated, a diminutio in the incidence of malaria was recorded amounting to approx mately 80%, and, in the supposed malaria patients who we being treated at that hospital, the reduction was 93%. Th diminution of morbidity due to malaria has been progressi during 1950 and 1951, and the directors of the campaign hop to be able to eradicate definitively this terrible disease, which ha prevented wider colonization of the fertile regions of the coas At the same time, the cost of the campaign has been relativel low, if it is compared with the cost incurred in similar operation in other countries. Treatment with D. D. T. has cost 0.10 sucre per square meter and 3.65 sucres per person (one dollar equa 15.15 sucres); this low cost is due to cheap labor and to the goo organization of the campaign.

Personal.—Dr. Teodoro Salguero was elected dean of th Faculty of Medicine of the Central University of Quito. D Salguero recently studied at the University of Michigan unde the auspices of the *Kellogg Foundation.*

CORRESPONDENCE

STUDENT AMERICAN MEDICAL ASSOCIATION

To the Editor:—Every doctor who takes a long-range view of American medicine should regard the formation of the Student American Medical Association with a sigh of relief. In the present floodtide of bureaucratic socialism, it can become one of the strongest sections of our dike against further governmental encroachments. It can also become an important medium for bringing the student into closer contact with the multitudinous problems he will encounter once he has entered into his own private practice.

On a national scale, this move has been long overdue. For too long a time, the medical student has been pushed straight from the classroom into the complicated maze of legal, financial, and ethical problems which confront the physician hanging out his shingle for the first time. By making the solutions to these problems part of his extracurricular education, we are helping the student to step into his practice as an oriented, well-adjusted person and as a genuine asset to his profession.

On a local level, I had anticipated this need as far back as 1938, when I sponsored the organization of the Student Medical Association at the College of Medical Evangelists in Los Angeles. For the past 13 years, this exceedingly active group has benefited socially and intellectually by its bimonthly meetings, which present the best speakers in a multitude of fields. Apart from earning of the latest advances in surgery, orthopedics, dermaology, and other fields, they learn how to invest their future profits for the greatest financial return, how to combat the dishonest patient, how to ethically and legally collect delinquent bills, how to play an important role in the combating of narcotic addiction, and how to manage many situations that will better enable the student to serve himself and his commmunity in the most advantageous manner.

Medicine has a tremendous variety of functions, of which he constant fight against socialized medicine is only a part. We believe in improvement of medical care and the furtherance of he art and science of medicine. It is therefore up to us to furnish hat connecting tie between organized medicine and the embryo physician to insure that he is familiar with medical life's general, over-all picture.

If it accomplishes nothing more, the S. A. M. A. will be exceedingly worth while in proving to the student that the American Medical Association is not an autocratic power—as he is too often led to believe—but rather a very democratic organization whose affairs are handled by elected representatives from their various districts. Its meetings are open and above board. All of its actions are intended to be for the best interests of the doctors whom it serves.

We should take it on ourselves to insure that members of this new organization have an opportunity to see for themselves what goes on in A. M. A. headquarters. They should know that each branch, each bureau, each officer has for its objective something for the advancement of the medical profession or the advancement of the American people's health.

It is never too soon to start educating the medical student in the American way of life. With the proper guidance, these students can and will make a significant contribution to their own best interests, as well as to that of the practicing physician.

DEATH FOLLOWING CORTICOTROPIN (ACTH) THERAPY

To the Editor:—In the editorial "Postpartum Necrosis of the Pituitary" (*J. A. M. A.* 146:653 [June 16] 1951), the statement is made that the role of corticotropin and cortisone in the treatment of pituitary insufficiency has not been determined. I know of the death of a 43-year-old white woman with Sheehan's disease 24 hours after the injection of 25 mg. of corticotropin. It raises the question of whether the injection of corticotropin, stimulating a dangerously depleted adrenal gland, might not be sufficient to bring about complete adrenal exhaustion with adrenal crisis and death.

This patient, in whom signs of pituitary insufficiency had developed after the birth of twins, 10 years earlier, was admitted to the hospital with high fever, sore throat, nausea, and vomiting. She improved with penicillin and supportive therapy. On the third hospital day she was given 25 mg. of corticotropin. The eosinophil count fell from 125 per cubic millimeter to 95 per cubic millimeter in four hours. The following morning she was found dead in bed. Autopsy revealed marked atrophy of the adrenals, thyroid, ovaries, and uterus. The cut surface of the pituitary gland revealed a large amount of fibrous tissue replacement.

The presence of long-standing anterior pituitary and secondary adrenal hypofunction appears to be well established by the clinical and pathological findings. In addition, the factor of the septic sore throat in bringing about further adrenal exhaustion is to be noted. If similar cases are reported, the danger of the use of corticotropin should be pointed out.

LOSS OF HAIR FOLLOWING PROPYLTHIOURACIL THERAPY

To the Editor:—At the instance of Dr. Morris Wilburne, I am submitting a statement on hair loss and pigmentation following the use of propylthiouracil. This occurred in a white man, 32, whose pretreatment basal metabolic rate was +51% and whose blood sugar curve showed diabetes mellitus with glycosuria (4+) in the fasting specimen. The height of the sugar curve one hour after administration of oral glucose was 600 mg. per 100 cc., with no return to the base line after three hours. He was underweight, the weight being 120 lb. and the height 68 in. The blood pressure was 130/80, the pulse rate varied from 96 to 133, and he had a bilateral nodular adenomatous goiter. He was given propylthiouracil, 100 mg. three times daily, in conjunction with strong iodine (Lugol's) solution, 4 minims (0.246 cc.) daily, and a diabetic regimen. Within two months, he noticed that his hair, beard, eyebrows, and lashes were rapidly falling out. One month later, his beard began to return, but it was noticed that, whereas the color had been a light brown, it was now white. At this time, the basal metabolic rate was +20%, the weight had increased to 134 lb., and the pulse rate was 96. He was sugar free. At this stage, the propylthiouracil was increased to 400 mg. daily, and the iodine solution to 8 minims (0.493 cc.). The fasting blood sugar was 122 mg. per 100 cc.

He had a first-stage (left lobe) thyroidectomy in May, five months after his first office treatment; the second stage resection of the right lobe was done two months later. During the period of hospitalization, and during other brief periods when the propylthiouracil was omitted, there was noted a temporary return of hair growth, but always the return was white.

MISSPELLING OF NAME SCHEFFEY

To the Editor:—I wish to call your attention to the misspelling of my name as Chief of Service in Obstetrics and Gynecology at Jefferson Medical College Hospital, as noted on page 423 of The Journal, Sept. 29, 1951, relating to approved residencies.

Lewis C. Scheffey, M.D.
Professor of Obstetrics and Gynecology
Jefferson Medical College and Hospital
Philadelphia.

MEDICAL MOTION PICTURES

Activity for Schizophrenia: 16 mm., black and white, sound, showing *time 20 min. Produced in 1950* for the Department of Medicine and Surgery by and procurable on loan from Presentation Division, Veterans Administration, Washington 25, D. C.

This film describes dramatically the employment of corrective therapy in the treatment of schizophrenia. It describes in detail the recovery of one patient from the time of his admission to a psychiatric hospital until the time of his discharge. His suicidal tendencies are overcome, electric shock therapy is administered, and the corrective therapist, under the guidance of the chief of psychiatry and the chief of physical medicine, provides individual and eventually group activities, which lead to abandonment of the suicidal attempts and gradual resocialization. It is mentioned that "corrective therapy is one of the keys which unlocks the prison of the sick mind" and that "physical movement is often the only means of expression for the schizophrenic." It is stressed that faith in the therapist is important. Occupational therapy is added to the therapeutic regimen, the patient is finally transferred from a closed to an open ward, and he starts group games involving increasingly complex social situations. There is a brief reference to the psychotherapy by the psychiatrist which finally leads to better acceptance by the patient of his parents. There is a dramatic first meeting with his parents and increased activity in occupational therapy, manual arts therapy, and the library; finally, the patient, all smiles, wins a baseball game and receives the approbation of the psychiatrist.

Despite the fine acting, good photography, and sustained drama, this film is misleading because it presents such a distorted view of the importance of corrective therapy. Specialists in psychiatry and physical medicine, who should play the leading role in the treatment of such patients, and also trained physical therapists and occupational therapists will undoubtedly resent the secondary role assigned to them in the recovery of this patient. Corrective therapists are usually graduates of physical education, with very limited special training in psychiatry and physical medicine. Obviously the faith placed by this patient in the therapist should have been placed in the psychiatrists and the other physicians who administered the medical care. The film is good entertainment but does not present a well-balanced picture of proper therapy for the schizophrenic patient. The photography is excellent, the acting is of a high order, and the script is interesting from start to finish.

Curare: Intocostrin, *d*-Tubocurarine Chloride, Mecostrin: 16 mm., color, sound, showing time 25 minutes. Produced by Billy Burke Productions, Hollywood, for and procurable on loan from E. R. Squibb & Sons, 745 Fifth Ave., New York 22.

This report type film is designed to demonstrate some of the basic pharmacological principles associated with the action of curare and to present some examples of its clinical application in surgery. After a repetition of the Claude Bernard experiment on the frog, electromyography is used on a human in order to demonstrate the peripheral action of curare. There are numerous short views of various types of operations, including general surgery and obstetrics, in which curare is employed. The dangers inherent in the use of curarizing drugs are well presented, and the technic of adequate artificial respiration under positive pressure is illustrated. It is candidly and correctly stated that the potential danger in the use of curare is related to lack of understanding of its action rather than to the drug itself.

While this film was not intended as an encyclopedia, it is felt that more stress should be placed on the proper selection and detailed management of patients receiving curare, in order to avoid misuse of the drug and fatalities. Early in the film, during the time that important material is presented by the narrator, the showing of uncorrelated views is distracting.

The simplicity of the technic for the administration of curare, as presented in this film, may mislead the uninformed. Only trained anesthesiologists can safely interpret and evaluate the use of curare as demonstrated, since they have sufficient knowledge of correct anesthetic procedures and safeguards for the administration of this potent drug. The photography and narration are excellent.

Bronchiogenic Carcinoma: 16 mm., color, sound, showing time 20 *minutes. Produced* in 1951 for the Department of Medicine and Surgery and procurable on loan from Presentation Division, Veterans Administration, Washington 25, D. C.

The stated purpose of this film is "to acquaint general practitioners and medical students with bronchiogenic carcinoma." It discusses rather briefly the high incidence of the disease an the symptoms, diagnosis, and treatment. One case is carrie through the steps of diagnosis, surgical removal of the lung and postoperative care.

Inasmuch as the purpose of the film is to acquaint the genera practitioner and the medical student with the clinical pictur of the disease, much more time should be spent on this phas of the subject and perhaps less time on the surgical technic, phase that is more particularly of interest to the thoracic surgeon The presentation of the clinical and x-ray findings is very limited and is not sufficient to give the viewer a good idea of th various manifestations of the disease. The importance of bronchoscopy as a diagnostic measure is stressed, but no mention i made of the fact that results of bronchoscopic examination ar positive in only about 25% of cases. The differential diagnosi of the patient with "virus pneumonia" was omitted, and in th very brief mention of cytology, the cytologic examination of th sputum was not mentioned. The presentation of the operatio entails good surgical technic, and the producers avoided the mistake of spending too much time photographing the preparatio of the skin and the details of making the exposure. In this case however, they failed to do what seems essential, namely, to sho the location of the incision in the patient's body and to orien the viewer in relation to the patient's body. This film does no fulfill the expectations aroused by the knowledge of those responsible for its production. The color quality of the print submitted for review is not good, thus the various anatomica structures are difficult to identify.

Weight Reduction Through Diet: 16 mm., color, sound, showing tim 15 minutes. Sponsored by the National Dairy Council in cooperation wit Michigan State College. Produced by the Jam Handy Organizatio Detroit. Procurable on loan from the National Dairy Council, 111 Nort Canal St., Chicago 6.

This film documents a weight reduction study conducted a Michigan State College. It opens with a brief foreword by Frederick J. Stare, M.D., of Harvard University, on the proble of overweight and several scenes that illustrate reasons why a overweight person should and might want to reduce. The r mainder of the film is devoted to actual photographs of t persons who took part in the program and a description of h the study was conducted. Cases illustrated include a group college students whose meals were taken at a training table a a group of non-students who followed their plans at home.

The film is scientifically accurate. It emphasizes the imp tance of dieting only under the supervision of a physician a illustrates the point that a person can have attractive appetizi meals even though he is on a reducing diet. This film would of interest mainly to persons exhibiting some interest in dietin to dieticians and home economists, and to home economi classes in schools. The photography and narration are sati factory.

Tattooing with Optical Iridectomy in Conical Cornea: 16 mm., colo silent, showing time 15 minutes. Produced by and procurable on loan fro Arthur Alexander Knapp, M.D., 907 Fifth Ave., New York, N. Y.

This film begins with 139 ft. of titles which describe the mea of restoring vision in eyes with corneal scars and deformities th seriously obstruct vision. Surgical procedures, such as excisio of the anterior layers of clouded cornea and iridectomy place so as to utilize a comparatively clear portion of the cornea, a briefly described. There follows a case history of a patient wi keratoconus. The corneal epithelium is abraded, and the centr portion of the cornea, to within 3 to 4 mm. of the limbus, i treated with solution which results in dense black staining. A iridectomy done at the limbus above will serve as a pupil, wi only slight astigmatism. The surgical dressing consists of a lubr cating ointment and a snug bandage. This film is designed to illustrate one method of treating corneal abnormalities that obstruc vision in an otherwise healthy eye. Its application is rathe limited. It could be shown to ophthalmologists interested i the author's technic of corneal tattooing but is not recommende as a teaching film. The photography is satisfactory.

Id.: II. Correlation of Post-Mortem Findings with Clinical Course of Disease in 101 Cases. G. K. Graham, J. A. Taylor, L. B. Ellis and others.—p. 532.

'reatment of Brucellosis.—Spink and associates made follow-up udies on 48 patients with bacteriologically proved brucellosis ho were treated with (1) a combination of streptomycin and ılfadiazine, (2) aureomycin, or (3) chloramphenicol. Brucella bortus was the cause of illness in 44 of the 48 patients. Among 1 patients treated with streptomycin and sulfadiazine, there 'ere 11 who promptly recovered and remained well, although ne of these had transitory bacteremia after treatment. Five dditional patients had positive blood cultures after treatment, lthough two of this group had no complaint of ill-health. Five thers had residual complaints of ill-health. Of 22 patients receiv-ıg aureomycin, 14 recovered promptly without a relapse; 3 atients had a relapse, 1 with a positive blood culture, and 5 atients were still in ill-health. Of eight patients receiving chlo-ımphenicol, two recovered completely; one showed no im-rovement; the bacteremia persisted in one, and four had esiduals of ill-health. This series included several patients with evere complications, such as spondylitis, suppurative arthritis, ıdiculitis, and subacute bacterial endocarditis. In every instance ıese complications were brought under control as a result of eatment. While this indicates a definite advancement in the ıerapy of brucellosis, a significant number of patients relapsed r had residual complaints of ill-health. Therapeutic investiga-ons should be made with the combination of dihydrostrep-mycin and aureomycin.

reatment of Pneumococcic Meningitis: Antagonism of Peni-llin and Aureomycin.—Among 43 patients with pneumococ-c meningitis treated with massive parenteral doses of penicil-n, 13 (30%) died. Among 14 similar patients treated with aureo-ıycin in addition to the same dose of penicillin, 11 (79%) died. o assure random sampling, alternate patients were selected for eatment with penicillin alone and for treatment with penicillin nd aureomycin combined. There was no essential difference be-veen the two groups with respect to age, the number of organ-sms in the spinal fluid, mental status, portal of entry, pneumo-occic complications, the presence of other diseases, or the day on which therapy was started. It is concluded that the poor results with the penicillin-aureomycin combination were not due to the chance inclusion of more severely ill patients in this group, nor did toxicity to aureomycin seem to account for the results. Rather, the evidence indicates that penicillin and aureomycin are mutually antagonistic when employed together in the treatment of pneumococcic meningitis. It appears unwise to use combinations of penicillin and aureomycin, terramycin, or chloramphenicol in treatment of patients with pneumococcic meningitis, or in treatment of any patients, even those with milder infections, in which antagonism has been shown in vitro. Consistently good results have been obtained in the treatment of pneumococcic meningitis with doses of 1,000,000 units of penicillin at two-hour intervals without use of the intrathecal route. Since good results have been obtained by the use of aureomycin therapy alone in pneumococcic meningitis, further studies should be made on the efficacy of aureomycin, terramycin, and chloramphenicol, without adjuvant penicillin.

Psychiatric Implications of Antabuse® Therapy.—This study evaluates the psychiatric implications of tetraethylthiuram disulfide (antabuse®) treatment of alcoholism, based on experience with 42 patients. In 8 of these 42 patients psychotic episodes developed, which were transitory in 5, responding promptly to the withdrawal of tetraethylthiuram disulfide and the use of mild sedation. Three were relatively prolonged. The projective, hostile person who feels threatened by help and who has diffi-

ɩn asterisk (*) before a title indicates that the article is abstracted.

culty in forming interpersonal relationships is usually not a desirable candidate for treatment with tetraethylthiuram disulfide. A history of psychotic epidoses or an indication of incipient psychosis contraindicates treatment with this drug. Borderline schizophrenic adjustments, as well as character neuroses with transitional schizophrenic components, should be watched for. Five of the eight psychotic responses occurred several weeks after the patient's discharge from the hospital, and indications of mounting anxiety usually had been observable during the earlier tetraethylthiuram disulfide alcohol reaction tests. Watching for this anxiety may be helpful in recognizing and managing psychiatric complications. Of the three other breakdowns, one emerged shortly after the third tetraethylthiuram disulfide alcohol test in the hospital (four weeks after the beginning of tetraethylthiuram disulfide medication), one occurred at the first test, and the third was manifested prodromally during the first test. The incidence of therapeutic success is highest when tetraethylthiuram disulfide treatment is employed with persons selected on the basis of psychiatric criteria of suitability. Ability to respond to psychotherapy also makes response to this drug likely. A considerable schizophrenic gradient was present in all patients who revealed tendencies toward psychotic reactions.

Transplantation of Ileum: *Experimental Study.*—In attempts to remove sigmoid and rectal lesions with preservation of the anal sphincter, new procedures are being devised and older ones modified. The authors of this paper suggest a method for restoring continuity of the large bowel with an interposed loop of ileum. Their work was done on nine dogs. A loop of terminal ileum was isolated by cutting the mesentery back to its root and dividing the bowel at each end. The continuity of the ileum was then restored by an open end-to-end ileoileostomy, and the mesentry was approximated. A rubber-shod clamp was left on the proximal end of the isolated ileal loop, while the distal end was occluded. The sigmoid colon was then divided. The proximal end of the ileal loop was swung over, and anastomosed to the descending colon. The mesenteries of the ileal loop and the descending colon were approximated down to the base of the mesentery of the descending colon. The mesentery of the sigmoid colon was incised and the rectum freed down to the anus. The ligature of the distal end of the ileal loop was secured to another ligature on the upper end of the sigmoid, which was to be resected. These two loops (the ileal transplant and the completely mobilized sigmoid) were replaced in the sacrum. Care was taken to carry the abdominal-pelvic dissection down into the internal sphincter. The perineal procedure was that of Swenson and Bill with a slight modification. Only four dogs survived, but the authors feel that the high immediate mortality should not detract from the value of the operation. The four surviving dogs, and all but one of those dying postoperatively, had viable ileal loops. Three animals with replacement of the rectum survived for relatively long periods, enjoying good healt
and were observed sufficiently long to evaluate stool habits. Tl
results indicate that continence may be obtained after a peri
of time, though only 1 cm. of rectum remains.

Cortisone and Survival of Homografts.—Homotransplantati
of pinch skin grafts was performed in 22 pairs of white albi
rabbits. One of each pair of rabbits was given cortisone, 4 n
per kilogram of body weight daily, and the other kept as
control. In all 22 controls the grafts healed primarily to
graft bed, but necrosis was well under way in many cases
the 6th day and was complete by the 10th to the 12th day in
cases. In 13 of the treated animals, the destruction of the gr
was definitely delayed at least during an observation period
from three to six weeks. These grafts remained viable,
there was continued epithelial spread from the graft border d
ing the period of observation. In two rabbits receiving cortisc
homografts were initially successful. However, in the third
fourth weeks, after the denuded area was epithelized, desqua
tion at the homograft sites occurred, native epithelium ap
ently replacing that of foreign origin. In another successf
treated animal, the grafts became completely necrotic wi
six days after cortisone was withheld, on the 18th day. In
other six treated animals, although some delay in the destruc
of the grafts was evident in comparison with the controls, ne
sis and death of the grafts occurred within two to three we
Five of these failures were in old males with very thick sk

***Factors in* Congestive Heart Failure.**—The concept of the
regulation of the fluid compartments of the body is essenti
an understanding of modern concepts of congestive heart fai
It is to be remembered that the fluid must be transported to
kidneys by the circulation, which in turn depends on myoca
integrity, and that the kidneys are sensitive to circulatory cha
and to pituitary and adrenal hormones. The "backward
sure" theory of the progression of congestive heart failure
been challenged as inadequate in explaining all of the associ
phenomena. A new concept of congestive failure, which emp
sizes extracardiac factors, has been derived. In this paper Rev
and associates report studies of kidney function in patients
congestive heart failure under the influence of aminophyll
a xanthine diuretic, and mercaptomerin (thiomerin®) sodiu
mercurial diuretic. Their purpose was to clarify the mechan
involved in the alleviation of edema. Simultaneous determ
tions were made of plasma volume (in terms of concentratio
Evans blue dye); venous pressure; specific gravity of the bl
hematocrit; renal clearance of sodium, potassium, and chlo
ions; and clearance of inulin and para-aminohippurate.
authors were able to confirm the depressing effect of merc
diuretics on tubular reabsorption of sodium. The circula
effects of mercurial diuretics apparently are secondary to
excretion of edema fluid. Clearance studies seem to indicate
aminophylline exerts its effect on the renal circulation. It
ments sodium and water excretion by increasing the glomer
filtration rate. Changes in tubular function after the adminis
tion of aminophylline are thought to be secondary to circ
tory effects.

*Effect of Cortisone upon Some Experimental Hypersensitivity Reactions. J. H. Humphrey.—p. 274.

Effect of Cortisone on Experimental Hypersensitivity Reactions. —Studies were undertaken to ascertain whether the decrease in the Arthus and other reactions previously observed after administration of large doses of salicylate could be explained on the basis of cortisone-like action, resulting primarily from the salicylate itself or arising secondarily from adrenal stimulation. The author's technique measured the effect of drugs on the edema at the sites of reversed passive Arthus reactions in rabbits. It was found that a single dose of cortisone greatly diminished such edema. A dose of 0.5 mg. per kilogram of body weight was effective, but 2 mg. or more per kilogram was more effective. The effect of cortisone was apparent within one hour after injection and lasted for up to 24 hours. Similar but less marked effects on passive Arthus reactions were produced by colchicine. Subsequent studies showed that the administration of cortisone conferred a definite but minor degree of protection against anaphylactic shock in guinea pigs and that cortisone, but not colchicine, prevented Shwartzman reactions in rabbits. A comparison of the effects of cortisone with those of large doses of sodium salicylate suggests that the effects of salicylate upon hypersensitivity reaction may be mediated through the adrenal cortex.

Hemispherectomy in Infantile Hemiplegia. — Infantile hemiplegia is the end-state of various pathological conditions affecting the cerebral hemisphere before or during birth, or in the first years of life. Most cases evolve in one of three ways: 1. The infant is observed to be hemiplegic after a difficult delivery. 2. The child appears healthy at birth, but an illness characterized by convulsions, coma, and fever, often diagnosed as "encephalitis," is followed by hemiplegia. 3. Without previous acute illness, the child has fits followed by hemiplegia. The authors disregard the cases of acute infantile hemiplegia in which physical and mental development is nearly normal and there are no fits. In the cases under consideration treatment is sought because of fits or mental abnormality. The hemiplegia affects the arm (especially the hand) more than the leg. The limbs are spastic and shorter and smaller than normal, and there is flexion contracture at the wrist and fingers and often talipes equinus. The patient may walk well, though with a limp. In the upper limb there are crude mass movements, often with an athetoid component. With this clinical state the opposite cerebral hemisphere is small; its lateral ventricle is usually dilated and there may also be porencephalic or subarachnoid cysts; the head and face are smaller than on the hemiplegic side. Until recently treatment was limited to anticonvulsant drugs, special schooling, physical therapy, and orthopedic operations on the affected limbs. Experiences by Krynauw and others with hemispherectomy induced Cairns to use this operation in three cases: a youth of 19, a girl of 7, and a young woman of 20. The results were dramatic. The fits have stopped and the hemiplegia is no worse; in two cases it is slightly improved, because the muscles are less spastic. The most remarkable improvement was in mentality. All three patients seem to have developed socially; one has shown great intellectual improvement, and the others have also improved in this respect. Behavior has changed dramatically. More experience is needed before the indications for cerebral hemispherectomy can be fully defined. It is not suitable for all cases, but it should be undertaken in any case of infantile hemiplegia with fits that cannot be controlled by drugs or in which there is backwardness or deterioration in the patient's intellectual or emotional state.

Guillain-Barré Syndrome: Three Cases in Aboriginal Natives. E. G. Saint. —p. 50.

Intensive Oxygen Therapy and Retrolental Fibroplasia.—The occurrence of retrolental fibroplasia is reported in 27 of 181 premature infants born during the three year period of 1948 to 1950. The birth weights of these infants varied from 1 lb. 7 oz. (652.04 gm.) to 3 lb. 8 oz. (1587.6 gm.). In the great majority of these infants there had been 30 weeks of gestation or less. The infants were in three different institutions. Management was identical except for the amount of oxygen used. The first group, comprising 123 infants, was given oxygen by oxygen crib in which the percentage of oxygen was from 40 to 60. The oxygen was often given prophylactically as well as during the periods of cyanosis; it was used more extensively than in the other groups. Of these 123 infants, designated as the high-oxygen therapy group, retrolental fibroplasia developed in 23. Most, but not all, of the infants in the second group were given oxygen by intranasal catheter or funnel in an electrically heated and humidity-controlled crib, while the infants in the third group received oxygen mainly by tent, sometimes by oxygen crib, and occasionally by intranasal catheter or funnel. These two groups together were designated as the moderate-oxygen therapy group and comprised 58 infants, in 4 of whom retrolental fibroplasia developed. The different incidence of retrolental fibroplasia in these two groups is statistically significant. The duration of oxygen therapy in infants with retrolental fibroplasia varied from eight days to intermittent therapy for six weeks. Oxygen was given to many premature infants for periods up to two and a half weeks without the condition developing and to a few for as long as four weeks without eye injury. It is suggested that high concentrations of oxygen may have a potentially toxic effect on premature infants and that this may have been enhanced in one of the author's patients by pyrexia and by toxemia in several others with a history of pneumonia. The generalized vascular damage and edema so produced may affect the eye and form the starting point for retrolental fibroplasia. The prophylaxis of his condition consists in the following measures: (1) an endeavor to carry the fetus to 33 weeks' gestation or more; (2) avoidance of intensive oxygen therapy by giving oxygen only when the infant is cyanosed and not as a prophylactic measure; (3) avoidance of overheating; (4) prevention of infection, and, should it occur, its prompt and efficient treatment.

*Mandelic Acid Therapy in Colibacillary Cholecystitis-Cholangitis: Experimental Proof of Elimination and Bactericidal Action of Mandelic Acid in Inflammatory Disorders of the Bile Passages. R. Lücking.—p. 642.

Mandelic Acid Therapy in Colibacillary Cholecystitis and Cholangitis.—Whereas formerly mandelic acid was employed only in colibacillary infections of the urinary tract, in recent years attempts have been made to employ it in enterocolitis, in perityphlitic and periproctitic abscesses, in diffuse peritonitis and in colibacillary cholecystitis and cholangitis. In these experimental studies it was found that intravenously administered mandelic acid appears in the bile and that in cholecystitis and cholangitis it finds in the bile passages the conditions necessary to exert bactericidal effects on colon bacilli. It was shown that mandelic acid has choleretic characteristics and is capable of influencing the acidity of gastric and duodenal secretions, which the author regards as additional proof of its therapeutic val Mandelic acid is more bactericidal in acute than in chronic orders of the biliary tract. The intravenous method of admi tration used in these studies has no advantage over oral adm istration, the latter being, moreover, more economical. bacteria are influenced much less readily by the massive, sh lived presence of antibacterial substances than by prolonged continuous presence of such substances. Parenteral therap indicated only at the onset of urgent conditions and in case which oral therapy is not advisable. The intravenous dose of drug was 20 cc. three times daily, injections being made slowly. For oral administration the author prefers magnes and ammonium mandelate. He regards from 12 to 15 gm mandelic acid substance as an adequate daily dose. A ketog diet or suitable medication and limitations of fluid intake valuable as supportive measures.

Lying on the Abdomen as a Therapeutic Measure.—In Rautenberg used the prone position in pulmonary diso with beginning liquefaction of exudate and deficient expec tion and described the results as life-saving. Stahl obse patients with tuberculosis of the vertebral column at Rol clinic in Leysin who were kept lying on the abdomen from 12 hours a day. Percussion of patients with different typ physiques revealed that in the supine position the lower of the lung differ little from those found in the sitting po but that in the prone position the limits are lower in all of physiques. Roentgenograms reveal that during both ins tion and expiration the postdiaphragmatic sinus is wider lower in the prone than in the supine posture. The mal opening of the posterior diaphragmatic sinus facilitates ter ventilation and blood perfusion in the lower lobe of the The abdominal posture can be tried in most patients except wounds, suppurations, or arthritis make it impossible or severe cardiac insufficiency, dyspnea, or a tendency to apo contraindicate it. The musculature is strengthened, and, in tion, the metabolism is stimulated and the complications re ing from prolonged lying on the back are prevented. The tion may have prophylactic value in pneumonia. unconscious patients can be put in this position, since it f tates evacuation of fluids from nose and mouth. The prone tion, preferably combined with occupational therapy, ca employed for group treatment in hospital wards by letting tients assume this position twice a day for from 10 min up to an hour. The author recommends the use of a flat matt A wedge-shaped cushion is placed under the chest, so that patient can lean his elbows over it; the head is held up an not to be supported. In some patients a ring-shaped cushion be placed under the abdomen. A wedge-shaped cushion u the shins prevents an excess load on the toes. The patients read, write, and do handicraft work in this position, in fact should be urged to work at something while they are in position, because with suitable diversion, they will maintai longer. Furthermore, activity in this posture will strengthen musculature of neck, shoulders, arms, and back.

BOOK REVIEWS

Ophthalmology. By Arno E. Town, M.D., Professor of Ophthalmology, Jefferson Medical College of Philadelphia, Philadelphia. Cloth. $10. Pp. 511, with 212 illustrations. Lea & Febiger, 600 S. Washington Sq., Philadelphia 6, 1951.

The author, assisted by 11 contributors, has prepared a textbook for the undergraduate and the general practitioner. It is written from the viewpoint of the ophthalmologist and concisely presents ocular disease and therapy rather than an integration of ophthalmology with general medicine. However, the general conditions commonly causing ocular signs are adequately discussed, and the chapter on the retina contains an excellent discussion of ophthalmoscopy in systemic disease. The first portion of the book, which is devoted to the objective examination of the eye, contains a particularly well-written section by Wagman on the physiology of vision. Succeeding sections concern the various parts of the eye and adnexa and anatomy, anomalies, diseases, and therapy. There are additional chapters on glaucoma, neuro-ophthalmology, ocular changes in systemic disease (in tabular form, which could well be expanded), therapeutics, eye injuries, and surgery. The various authors' contributions have been well integrated, and there is no unevenness and little overlapping of subject matter. References are not exhaustive but indicate the significant recent work in the field. The illustrations are pertinent, numerous, and well reproduced; mechanically the book is excellent.

There are a number of references to corticotropin (ACTH) and cortisone, but, as might be expected, the tremendous clinical implications of these hormones in ophthalmology have not been reflected in the text. The frequency of sensitization to local penicillin is not emphasized, and the reader may conclude that it is the antibiotic of choice for topical application. Similarly, sulfathiazole ointment is recommended for local use, although it causes sensitivity in a large number of users. Some of the therapeutic concepts presented are controversial, and the wisdom of their presentation in an introductory text may be questioned. The book may be added to the growing list of texts available for undergraduate teaching of ophthalmology; it is probably the most up-to-date of any currently available.

Visceral Radiology. By Emerik Markovits, M.D. Cloth. $24. Pp. 612, with 682 illustrations. The Macmillan Company, 60 Fifth Ave., New York 11, 1951.

The author was educated in Hungary and is now living in New York. Formerly attached to the Holzknecht-Institute of Vienna, Dr. Markovits is now radiologist of the Steiner Cancer Clinic, Atlanta, Ga. In 1949 he published "Bone and Joint Radiology." The distinctive feature of the present work is best described by the author in his preface. He says, "As in my previous book, 'Bone and Joint Radiology,' the subjects of this volume are also viewed in the mirror of the basic sciences of anatomy, physiology, and pathology, rather than on simple experience in interpreting roentgenograms and fluoroscopic images." The author further says, "The clinical responsibility of the radiologist is more and more apparent and has often to be shared by other specialists." The author has succeeded in presenting his subject in the manner intended. Anatomy, physiology, the basic sciences, and clinical history are emphasized throughout.

The book is divided into six parts. Fully one-third is occupied by Part 1, "The Chest and the Respiratory System." The author has covered an extensive area of related clinical aspects as they appear to the radiologist in his examination. Fluoroscopic observations are emphasized. Part 2, "The Circulatory System" deals largely with that portion of the circulatory system contained in the thoracic cage. Part 3, "The Digestive System" covers the radiologic aspects from the esophagus to the distal colon. "The Abdomen and Abdominal Organs," Part 4, is a small section and covers the subject rather generally. Part 5 is "The Genitourinary System," and Part 6 concerns the central nervous system and is brief compared to the other portions.

Each part contains a number of rather terse charts of differential diagnosis. Here the author has integrated the clinical aspects with radiologic observations. The volume is profusely illustrated with both radiographic reproductions and many schematic charts. From the standpoint of the advanced radiologist the subject matter is largely elementary and hardly original. The author has freely drawn from other authorities but with proper recognition in every instance. The volume would be helpful to the clinician and would be an excellent guide for students in radiology as well as a satisfactory pattern for the teacher to follow in undergraduate teaching. The most commendable feature of the entire work is the emphasis on the correlation of clinical aspects with radiologic studies and the importance of evaluation of radiologic interpretations in terms of clinical manifestations. The reproductions are excellent, and the schematic charts are well done. The volume also includes an extensive bibliography, upon which the author has presumably drawn liberally.

Histologie und mikroskopische Anatomie des Menschen. Zweiter Band: Organe und Systeme. Von Dr. W. Bargmann, o. ö. Professor der Anatomie an der Universität Kiel. Cloth. 45 marks. Pp. 563, with 412 illustrations. Georg Thieme, Diemershaldenstrasse 47, (14a) Stuttgart O; agents for U. S. A., Grune & Stratton, Inc., 381 Fourth Ave., New York 16, 1951.

This book deals with the specific histology of the various organ systems. Interestingly enough, the circulatory system is combined with the defense system, including not only the blood but also the spleen, the lymph nodes, and the reticuloendothelial and lymphoepithelial systems, the last-mentioned including the tonsils and thymus. Otherwise, the system organization follows more conventional lines. The attempt to incorporate physiological, biochemical, and submicroscopic morphologic findings into a textbook of histology succeeded surprisingly well; pathologic observations also find extensive consideration, and the correlation with the gross anatomy is well accomplished. The illustrations are almost entirely black and white drawings, some of them schematic, all of them of excellent didactic value and well reproduced. An unusually large number are based on original work of the author, who has contributed much fundamental information to histology in general. The discussion is rather detailed, in many places more than required for the medical student, but serves well as a reference book. A small number of well selected literature references, almost exclusively German, follow each chapter and serve as a good starting point from which to obtain further information. In toto, the book presents histology at its best and should be a help to the American who is interested not only in good histologic illustrations but also in obtaining finer points of information.

Radioactivity Applied to Chemistry. Arthur C. Wahl, editor, and Norman A. Bonner, assistant editor. Cloth. $7.50. Pp. 604, with illustrations. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16; Chapman & Hall, Ltd., 37-39 Essex St., Strand, London, W.C.2, 1951.

The purpose of this book is to acquaint the reader with the possibilities of applying radioactivity to various fields of chemistry and to furnish him with a summary of the work that has already been done. The book is divided into two parts. The first deals with the application of radioactivity to chemical kinetics, structural chemistry, self-diffusion studies, analytical chemistry, surface determination, and the discovery and investigation of the newer elements. Isotopic exchange reactions, behavior of carrier-free tracers, chemical phenomena accompanying nuclear reactions, and emanation methods are also described. The second part of the book contains 18 tables corresponding to the subject matter of the text and summarizing the data found in the literature to January, 1950. An important contribution to the rapidly growing literature of radiochemistry, this book will be of great interest to the research worker and student in this field.

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated.

Large Scale Rorschach Techniques: A Manual for the Group Rorschach and Multiple Choice Tests. By M. R. Harrower, Ph.D., and M. E. Steiner, M.A., Research Psychologist, General Electric Company, Bridgeport, Connecticut. With contributions by Floyd O. Due, M.D., Assistant Clinical Professor of Psychiatry, University of California Medical School, San Francisco, Beatrice A. Wright, Ph.D., Assistant Professor of Psychology, San Francisco State College, San Francisco, and M. Erik Wright, Ph.D., M.D., Professor of Clinical Psychology, Department of Psychiatry, University of Kansas Medical School, Lawrence, Kan. Publication number 82, American Lecture Series, monograph in American Lectures in Psychology. Edited by M. R. Harrower, Ph.D. Second edition. Cloth. $8.50. Pp. 353, with illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 49 Broad St., Oxford; Ryerson Press, 299 Queen St., W., Toronto 2B, 1951.

This is intended as a manual for the group Rorschach and multiple choice tests. It presents the procedure in administration and scoring for both tests, together with various studies that have been made in an attempt to establish their validity. The introduction of group procedures with the Rorschach caused much controversy over their validity and reliability. Many authorities objected to these methods on the grounds that they destroy the essential nature of the Rorschach, so that they can never hope to achieve comparable results with the individual method. This is freely admitted by the authors, but it is emphasized that the group procedures are not meant to replace the individual Rorschach; they are meant to be used as screening devices when large-scale psychological testing is required. Thus, the question is not whether the group procedures are as good as the individual Rorschach but whether they are better and more economical in time and money than the psychometric screening devices we now have. The answer to this question can only be obtained through further research. To fully understand the group procedures and their results it is advisable that the reader have some previous knowledge of scoring and interpretative principles for the individual Rorschach, since they are not given in the book.

This edition contains several studies not found in the first edition (1944). The most valuable is a statistical comparison between the group and individual Rorschach methods as to the locations, determinants, and contents "pulled" by each card for normal persons. This, together with the studies of frequency of rejection and distribution of anatomic answers on each of the 10 cards and the list of popular answers, can be a great aid even to the clinician interested only in the individual Rorschach. The section on interpretative principles in differential diagnosis provides a good review of pathognomonic indicators, for they are resented in a clearer and more condensed form than in the more asic texts by Klopfer and Beck. It tends to be dogmatic, however, and over-generalized, so that one who is unfamiliar with the Rorschach may be led to accept them without qualification. This is not intended to be the last word on the group Rorschach and multiple choice tests, but rather it is meant to point the way to future research. Clear in its presentation of experimental design and the statistical methods used, this book is an excellent example of the scientific approach to a study of personality.

Electroencephalography in Clinical Practice. By Robert S. Schwab, M.D., Director of Brain Wave Laboratory, Massachusetts General Hospital, Boston. Cloth. $6.50. Pp. 195, with 106 illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London, W.C.2. 1951.

The purpose of this monograph is to discuss the uses and limitations of electroencephalography in the diagnosis and study of diseases of the nervous system. It is addressed to neurologists, neurosurgeons, psychiatrists, and internists who treat neurological patients. The monograph is divided into nine chapters. The first four chapters concern the history of the development of electroencephalography, the technique, and the criteria for the separation of normal from abnormal records. Chapter 5 deals with the findings in epilepsy; Chapter 6 with other neurological and neurosurgical problems, and Chapter 7 with the electroencephalogram in psychiatry. These chapters are well written and give the clinician a clear summary of the value of electroencephalography in diagnosis. Chapter 8 discusses briefly the use of the electroencephalogram in research. Chapter 9, which deals with laboratory organization, training of the staff, and interpretation of the record, is perhaps unnecessary in a monograph not intended for the electroencephalographer.

The format of the book is good. The illustrations are clearly reproduced and serve their purpose of assisting the reader to understand the abnormal findings in various morbid conditions. There is a good bibliography at the end of each chapter and an adequate index. Most of the books previously published on electroencephalography have been in the nature of atlases and are of value chiefly to the electroencephalographer. This monograph fills the need of the clinician for a book that explains the value and limitations of the electroencephalogram in diagnosis. It should be in the library of all physicians who have occasion to refer their patients to the electroencephalographer.

A Citizens' Handbook of Sexual Abnormalities and the Mental Hygiene Approach to Their Prevention. By Samuel W. Hartwell, M.D. Report to Committee on Education of Governor's Study Commission on Deviated Criminal Sex Offender, State of Michigan. Paper. Pp. 71. Lansing, 1950.

The increased prominence of crimes by deviated sex offenders and the lack of understanding on the part of the public of what constitutes sex deviation has led Dr. Hartwell to prepare this report, which covers types of sexual deviation, disputed questions and fallacies, mental hygiene of sex, and practical aspects of the problem.

This report could be understood by an informed layman or a physician but would be not too helpful to the average person without training in psychology, child growth and development, the basic concepts of psychoanalysis, or psychopathology. The first chapter contains a rather detailed description of the common patterns of deviation and the effect each is likely to produce upon a society. Many of the misunderstandings of the layman who reacts violently to sexual deviation are explained in the second chapter. The third chapter covers the growth and development of personality and many of the reactions toward sex life from a psychoanalytical point of view. This includes an excellent chapter of sexual instruction, which could well be used by the parent groups, the church, and the school in planning instructional programs for children. The last chapter outlines the difficulties of solving the problem of sex deviation, particularly in regard to the use of the courts, punishment, and therapy. The last page contains a short but complete bibliography on sexual deviations, mental hygiene, and social psychiatry. Dr. Hartwell and the commission should be complimented for making a report of this character available to those who are concerned but uninformed on the specific problem of the deviated criminal sex offender.

John Hunter. By S. Roodhouse Gloyne, M.D., Consulting Pathologist, London Chest Hospital, London. Cloth. $3.50. Pp. 104, with 17 illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2, 1950.

In his short biography of John Hunter, the famed Scottish surgeon, Dr. Gloyne has given a concise account both of 18th century English medicine and of Hunter's contributions to that era.

Hunter is followed through the formative years, when a strong interest in biology and an equally strong dislike for books and the arts is manifested. His early investigation of so many animal species was responsible in part for the eventual accumulation of the enormous variety of specimens in his museum. That he shunned the classics and did not write with ease is evidenced by his halfhearted attempt at an Oxford education and by the scant number of books and letters he wrote.

Next are described the early days in London with his brother William, who was also to become a well-known surgeon. Their anatomy school soon was acclaimed throughout Europe and served not only to train new surgeons in the "art" of dissection but to hasten the acceptance of progressive medical education in England and on the continent. Hunter's rise to the post of surgeon-general to the army and surgeon to the king was gradual. Many years of research in previously unexplored fields affected his health. His death in 1793 ended a fruitful life of 65 years.

The author is an obvious admirer of John Hunter and in fact could be criticized for devoting a disproportionate amount of space to the defense of Hunter against even the mildest of innuendos of previous biographers. However, Hunter's life is well-documented with photographs, and a complete bibliography is included. These features, in addition to the fluent style of Gloyne, make the book both informative and pleasurable reading.

QUERIES AND MINOR NOTES

CANCER OF THE LUNG

To the Editor:—*A 55-year-old man has cancer of the lung established by bronchoscopy, biopsy, and x-ray. Complete surgical removal of the left lung has been proposed. Symptoms began two or three months ago with a "cold" and productive cough, relieved by expectorants but not by antibiotics. Sputum has been negative for pathogens. Physical signs were limited to some dulness in the lower lobe of the left lung. There was no blood in the sputum. Weakness and cachexia have developed, with pain to the left of the spine at the lower rib margin, radiating around to the front. Further studies show a small grayish mass in the left bronchus; no cancer cells in the sputum (Papanicolaou stain); no x-ray evidence of metastasis to the skull; an enlarged, smooth liver reaching to the umbilicus; and stones in the gallbladder. Results of gastrointestinal study were negative. The patient has diabetes mellitus, and in the last two years he has had three severe attacks of coronary thrombosis. Psychologically, he is a bad risk. Kindly comment on the following: 1. Do metastases already exist; are they likely to occur; and where are the most likely locations? 2. Are the risks of this operation too much, considering his heart and diabetes? Will there be much deformity, as lordosis or kyphosis? 3. What would be his life expectancy with and without operation? Would the operation be his only hope for some relief? 4. Would high voltage roentgen therapy, radium, isotopes, or hormones be of any value if operation is refused?*

M.D., New York.

Answer.—The chance of a cure in this patient seems relatively small, because the severe pain probably represents invasion of the lower thoracic wall and because the enlargement of the liver may be due to metastasis. The cachexia, however, might be due to anorexia and sleeplessness from pain and worry. Although the heart condition and, to a small extent the diabetes, increase the surgical risk, this is less than the risk of an uncured carcinoma. As distant metastasis has not been demonstrated, a prompt exploratory operation (assuming sufficient respiratory reserve for the intended lobectomy or pneumonectomy) may reveal that no metastasis to the mediastinum has occurred, that invaded parietal pleura overlying the pulmonary lesion may be removed by extrapleural dissection, and that all the carcinoma tissue can be removed by lobectomy or pneumonectomy.

To answer the specific questions: 1. Metastasis has not been demonstrated. It almost always occurs in late bronchogenic carcinoma and occasionally occurs early. Most frequently it is in the hilar, mediastinal, lower cervical, and axillary lymph nodes, in the spine and other bones (roentgenological recognition is often later than clinical symptoms and signs), brain, liver, and adrenals. 2. As to operation, in fighting cancer, great risks are justified. If an uncomplicated resection operation can be performed, the patient will probably leave the hospital in about 10 days, and there should be no scoliosis, lordosis or kyphosis. 3. Without successful surgery, death will probably occur in 3 to 12 months. Only surgery can cure a true bronchogenic carcinoma (excluding grade 1 carcinoma or adenoma or carcinoid). 4. High voltage roentgen therapy sometimes temporarily relieves pain and the symptoms of bronchial obstruction but only rarely lengthens life. Such treatment is only occasionally used after apparent complete cure of a bronchogenic carcinoma. Radium, isotopes or hormones have not been demonstrated to be of value.

PETTING, KISSING, AND TUBERCULOSIS

To the Editor:—*What are the chances of contracting tuberculosis at parties at which there is the usual petting and kissing? I am wondering about the advisability of following such parties with a prophylaxis of some sort.*

M.D., Illinois.

Answer.—Many tuberculous infections are transmitted by kissing. In the average population, however, the chances are not over about 1 in 500 that unknowns would have a form of disease that could be transmitted by kissing. Of each of the exposed guests, probably only one in many would have bacilli aspirated into the lungs where infection could result; of each such aspiration perhaps only 1 in about 10 would produce a significant lesion, with about one-third of the latter resulting in clinical disease.

The chances of disease resulting are, therefore, only one to many thousands for each person present. In a group of 10 persons, there is a possibility that some may be diseased, both male and female. An increase in size of the group increases the possibility of spread of infection but still leaves the chances of infection by such means remote. Furthermore, the time between the development of positive sputum and the diagnosis generally is short in that age group. Either they will have had a chest x-ray, or clinical symptoms will advance so rapidly that a diagnosis can be made clinically within a period of a year. Like lightning, however, an infection may strike from any quarter at any time, and there is no guarantee of safety. There is almost as much danger from persons coughing or contaminating objects in public. After all, the chances are little more than are encountered in daily life and there is a calculated risk in almost anything. Since man is a social creature, he must expect risks in social contacts, even in petting parties. The other alternative is to become a hermit or a bore.

The best way to insure against acquiring infections from such sources is to know in general the personal and family history of the persons present. Appearance alone is deceiving and is unfair to many poorly nourished girls, while certain open cases of tuberculosis appear in robust persons. Above all, one should not become a hypochrondriac. From a public health standpoint, such parties are not to be recommended.

There is no certain way of prophylaxis against tubercle bacilli in the mouth, especially several hours after such a party. Most of the bacilli, however, would be swallowed and would pass through the gastrointestinal tract. Only a few are aspirated or gravitate into the lungs.

INDUCTION OF LABOR

To the Editor:—*It seems to be an increasingly common practice to induce labor for no indication other than the convenience of the attendant or the parturient. Can this be considered good obstetric practice?*

M.D., Nebraska.

Answer.—The answer is unquestionably that this is not good practice in general. One must, however, consider in this problem the following factors. 1. The group at Evanston Hospital, Evanston, Ill., found that it was perfectly safe to induce labor by rupture of the membranes if the patient was near term, the cervix was soft and effaced, and if there were no contraindications such as malposition. 2. There is an increasing number of patients with very short labors with their first pregnancy and there are many multiparas who barely get to the hospital in time for delivery. 3. With the advantage of the sulfonamides, the antibiotics and better prenatal and intranatal care, there is now such a low morbidity and mortality that many procedures are probably done now that never would have been dreamed of 20 years

---

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

ago. 4. With the additional factor of better pediatric care, more mature babies are being saved. 5. Many of us at times have wished we could induce labor early for one reason or another, such as toxemia or cephalopelvic disproportion. 6. One must admit that if it were possible and safe, it would certainly be to the advantage of both patient and physician for the baby to be delivered at a reasonable hour.

Perhaps in a few more years we will consider this normal practice and until then accept an attitude of tongue-in-cheek toward it, rather than one of lifted eyebrows. Certainly the burden of proof of its safety is on the shoulders of those who practice early induction.

NEUROFIBROMATOSIS

To the Editor:—*What is the treatment of neurofibromatosis, and what should be done for the pigmentations that probably are the result of the irritation of the nerve covering near the skin? Is there any known specific or preventive treatment for neurofibromatosis?* *Jacob Aisenstat, M.D., New York.*

Answer.—Neurofibromatosis or Von Recklinghausen's disease is a hereditary condition. The pigmentation in the skin is part of the disease and not the result of nerve irritation. Ordinarily, the cutaneous manifestations of the disease require no treatment. At times, however, large or pendulous plexiform neurinomas involving the skin produce unsightly or inconvenient masses that can be excised. Neurofibromas within various peripheral nerves may interfere with the function of those nerves. These usually can be extirpated without serious injury to the nerve itself. Sometimes neurofibromas in the soft tissues of the body undergo sarcomatous degeneration, but this usually occurs in persons with isolated lesions. It is seldom seen in generalized neurofibromatosis. These sarcomas are often not highly malignant, although they do tend to recur locally if they are not completely excised. At times a more malignant variety is seen. The most serious lesions that occur in this condition are those neurofibromas that occur within the spinal canal and press on the spinal cord; the neurinomas that develop on the various cranial nerves, particularly on the eighth or auditory nerve, compress the brain stem and produce increased intracranial pressure; and meningiomas that arise from the meninges covering the brain and which are often multiple. Such tumors must be dealt with as one uld deal with any intracranial or intraspinal tumor; that is, by ision, if possible. There is no specific treatment for neuro- omatosis.

SYPHILIS

To the Editor:—*A patient with latent congenital or latent acquired (from wet nurse) syphilis was treated energetically one year ago but still has a 1 + blood Wassermann reaction. He is married and has two children, living and well. 1. Can latent congenital syphilis be cured? 2. Can congenital syphilis be transmitted to the third generation? 3. Does the positive reaction mean that he has syphilis? 4. Is congenital or latent syphilis contagious to partners? 5. Can he be cured by penicillin? 6. Can a negative blood reaction be obtained in latent syphilis after treatment?*

Teh Hwa Shih, M.D., Taipeh, Taiwan (Formosa) China.

Answer.—1. Latent syphilis may remain latent throughout life, progress into some form of late syphilis, or be cured. 2. Transmission of congenital syphilis into the third generation is exceedingly rare. 3. The positive reaction in this case probably means merely that the serologic test of the blood still gives a slightly positive reaction. The status of the cerebrospinal fluid should be determined. 4. No. 5. A cure cannot be predicted. If it is decided to treat this patient, penicillin should be employed because it is quicker, less expensive, and less dangerous than heavy metals. The ultimate results, however, are no better than those from heavy metals. If the patient has had an adequate amount of treatment and remains well clinically and the serologic titer of the blood does not rise, it is not necessary to give more treatment. 6. The serologic reaction of the blood may become negative in time, remain fixed, or become progressively stronger. Only in the latter event should one consider giving more treatment.

CYSTITIS FOLLOWING INTERCOURSE

To the Editor:—*The query entitled "Cystitis Following Inter
course" in* The Journal, *August 18, 1951, page 1546, wa
incompletely answered. The patient involved unquestionabl
has chronic urethritis which is aggravated by the sex ac
Cystitis following intercourse is a common complaint in som
of these cases. Dr. Hardy stated that the aggravated symp
toms were controlled with antibiotics, indicating acu
exacerbations of the chronic urethral infections. A caref
urethroscopic examination would disclose this patient's patho
ogy and suggest the treatment.*

Leander W. Riba, M.D.
720 North Michigan Ave., Chicago.

To the Editor:—*On page 1546 of* The Journal, *Aug. 18, 195
is a question from Dr. Hardy entitled "Cystitis Followi
Intercourse." The symptoms associated with cystitis follo
ing intercourse are typical of that produced by urethr
trauma, and I think the answer will be found only by doi
a complete urethroscopy or panendoscopy.*

*It is rather easy in these cases to put a sound into the ureth
and palpate vaginally over the instrument. Usually there w
be a tight meatus, and I doubt that this patient will be ab
to tolerate a No. 30 FS, which is usually about normal. The
probably will be some periurethritis, and perhaps some sm
abscesses can be palpated. Occasionally it is possible to
press pus by palpation over the instrument. If there is a mea
stricture, a simple meatotomy, which can be done in the offi
usually is curative after the urethra is dilated for six to eig
weeks to allow healing in the normal position. There may
some bladder neck or posterior urethral polyps or granu
tions that can be treated transurethrally.*

*I disagree strongly with the statement that a psychiatr
will be necessary. It is true that many such patients have be
referred to psychiatrists without a complete examinati
which should include urethroscopy, but it is much like dia
nosing pulmonary tuberculosis without sputum examinatio
or x-rays for confirmation.*

*If the urethra is the source of trouble, it is logical to
how an inflamed, perhaps infected, urethra will interfere w
intercourse for the female and would certainly result
cystitis after the trauma from intercourse had pushed enou
infection from the urethra into the bladder. In the* Jour
of Urology (**61:**557 [March] 1949) *I reported on this matt
and the writings of Dr. A. I. Folsom should have called
attention of the medical profession to this problem in the pa*

To the Editor:—*I would like to take issue with the answ
to the question on cystitis following intercourse appearing
*The Journal *of Aug. 18, 1951 (page 1546). Information w
submitted that this woman repeatedly had cystitis one to thr
days after intercourse and at no other time. The urinary infe
tion was controlled promptly by chemotherapy or antibioti
and was not apparent between attacks. The point was not ma
that the urethra is the most probable site of disease, and
infection of Skene's glands should be ruled out first. Cystosco
was advised. It is often assumed that cystoscopy includes o
servation of the urethra, but too frequently it does not. Cyst
urethroscopy should be advised, and in this case the urethro
copy is of greatest importance. A small diverticulum of th
urethra or a pseudodiverticulum in the form of a pocket
the site of an old infected Skene's gland may be present. Th
seems to me to be a clear-cut picture of organic disease. Th
the gastrointestinal tract might be simulating cystitis and th
last suggestion that the patient might need a psychiatrist see
far afield for a patient with pus in the urine controlled wit
drugs.*

COMPLETE FUNCTIONAL RECOVERY AFTER CORONARY OCCLUSION AND INSUFFICIENCY

Arthur M. Master, M.D.
and
Harry L. Jaffe, M.D., New York

Three decades have elapsed since coronary occlusion became widely recognized as a clinical entity. It is now possible, therefore, to have a comprehensive view of the acute attack and to study its subsequent course among the many patients who have survived. At first, only the severe attacks were recognized as occlusions and their mortality rate was high. The prognosis for all patients with coronary occlusion, therefore, was considered to be poor. Later, the introduction of early and complete bed rest, a low-calorie diet, and the discreet use of drugs saved many lives.[1] It is now relatively simple to recognize mild and atypical acute coronary episodes, from which the patient usually recovers. The mortality rate in first attacks of the disease is, at present, only 10% or less. As a result, the early pessimism concerning an acute coronary occlusion has gradually diminished.

The progress of patients who have survived an occlusion has, hitherto, received only sporadic study.[2] A number of years ago White and Bland [2a, e] and the present authors, with Dack,[2d, f] pointed out that one-third of the patients who sustained an occlusion had no symptoms afterward and did not have to restrict their activities. One-half of them resumed gainful employment. In a recent series of 84 patients, 43% were working one year after the attack.[2g] Occasionally, patients have lived for 20, and even 40 years, after an occlusion.[3]

Despite these findings, many physicians and laymen still believe that a coronary occlusion necessarily causes a marked reduction in the patient's activities and a marked decrease in his life expectancy. It has even been stated that the average duration of life, after an acute occlusion, is 4.2 years.[2b]

Our previous follow-up studies and our more recent experience have increased our optimism concerning coronary occlusion. We have been more and more impressed by the large number of patients who have made a complete functional recovery and who have led active lives for many years. In the present report we shall discuss this latter group of cases; later we shall consider those patients who continued to have symptoms after the attack.

In addition to the cases of acute coronary occlusion, we have reviewed those with acute coronary insufficiency.[4] The latter results from a sudden disproportion between the coronary flow and the needs of the myocardium, without any fresh occlusion. In some cases the coronary arteries are not severely narrowed. Coronary occlusion almost invariably occurs spontaneously, whereas coronary insufficiency may take place either spontaneously or as a result of conditions which suddenly increase the work of the heart, diminish coronary flow, or reduce the oxygen-carrying capacity of the

blood.[5] The commonest causes are effort, exertion, trauma, acute hemorrhage (particularly of the gastrointestinal tract), shock, operation, tachycardia, aortic stenosis, and excessive administration of insulin. Coronary insufficiency may cause only myocardial ischemia or, if it is severe enough, it produces focal necrosis of the subendocardial region, instead of the through-and-through infarction from endocardium to pericardium associated with coronary occlusion which completely obstructs the artery.

Attacks of coronary insufficiency are usually more severe than angina pectoris and milder than coronary occlusion. Coronary insufficiency can be differentiated from occlusion by means of the electrocardiogram in 95% of the cases. In coronary occlusion there are deep Q waves and RS-T elevation that is gradually replaced by persistent T wave inversion.[4c] In coronary insufficiency T wave changes and RS-T depression usually appear early and return to normal in several days or weeks. These electrocardiographic differences arise from the fact that in coronary insufficiency only the subendocardial region is usually involved. (Occasionally coronary occlusion produces the electrocardiographic pattern usually associated with coronary insufficiency. This holds particularly when the infarct involves the true posterior surface of the left ventricle; what is ordinarily termed "posterior" infarction is actually diaphragmatic.[5b])

Energetic and prompt treatment of the conditions precipitating acute coronary insufficiency usually overcomes the latter. Although death may occur suddenly as a result of the coronary insufficiency, the spontaneous attack usually subsides, since the myocardial necrosis is not extensive, and the patient recovers. However, some of these patients have severe coronary disease and continue to experience frequent anginal pain. In this report we shall consider in detail the group which has recovered completely.

Not infrequently a spontaneous episode of coronary insufficiency is the precursor of a coronary thrombosis which may develop in several days or weeks.[6] These cases have been included in the series of coronary occlusion.

MATERIAL

During the past 25 years we have personally observed 554 patients during or after an attack of coronary occlusion. Seventy-nine of the patients with coronary occlusion were seen only during the acute attack. (Thirty-five of these 79 patients died during the acute attack. Most of them were severely ill and were seen only once in consultation.) In 63, a satisfactory follow-up was not possible. Thus, in this study, the course following coronary occlusion was studied in 412 patients. In addition, 141 patients were investigated after acute coronary insufficiency. The average duration of the follow-up study was 6.5 years, the range being from 3 months, in a few cases, to 29 years, in one case. The average age of onset of the attack was 54 years. There were 345 men and 67 women, a ratio of 5 to 1. Eighty per cent of th 412 studied were seen in private practice; the remainder were ward patients.

PROCEDURE

Coronary Occlusion.—In determining the degree of functional recovery, the 412 patients were divided into four groups according to symptoms:

1. Those who did not experience anginal pain, dyspnea, or severe weakness. The majority of these patients felt very well and resumed their previous occupations, or engaged in simila work. It was not necessary for their activity to be restricted however, *in some cases curtailment was imposed by the* patien himself or on the advice of a physician merely because of th *previous occurrence of coronary* occlusion.

2. Those who experienced mild or infrequent anginal pain o exertion or emotion, but whose activities were only slightly restricted. Many of these patients were working, although a number complained of some weakness and of slight dyspnea o exertion.

3. Those who experienced severe or frequent angina, not onl on exertion, but sometimes at rest. They were quite weak. Som complained of moderate dyspnea on exertion. Their activit was definitely restricted, although a few could perform ligh work.

4. Those who had definite symptoms of congestive failure, o an intractable anginal syndrome. Their activities were markedl or completely restricted, although two of this group worked a executives.

In addition to this primary classification on the basi of symptoms, the patients were further divided into fou groups (A, B, C, D) according to the objective finding disclosed by physical examination, blood pressure reading, fluoroscopy, x-ray, and electrocardiogram. Six che leads were taken in the majority of cases; in many th unipolar extremity leads were also recorded. A "tw step" exercise electrocardiogram and a ballistocardi gram were recorded in a small number of the patient but the results of these two tests were not considere when the patients were secondarily placed into the fo lowing classifications:

A. Those in whom the physical examination of the hea the blood pressure, fluoroscopy and x-ray, and the electrocardi gram were *normal, or practically so.* In some electrocardiogra for example, there were small narrow Q waves, particularly leads 2, 3, and V_F, somewhat low T waves in the standard lea or small R waves in leads V_1, V_2 and V_3. On x-ray examinati some of these patients showed fullness or rounding of the low left border of the heart; this may have indicated minimal hyp trophy of the left ventricle.

B. Those in whom there were mild or moderate abnorma *ities in the* electrocardiogram and/or in the size of the hear In some cases the changes in the electrocardiogram were min mal; for example, a Q wave in A-V_F, or in one chest position. four patients, the electrocardiogram was normal.

C. Those in whom there was a marked enlargement of t heart, usually with reversal of pulsation, and/or advanc changes in the electrocardiogram. In many of the patients in th group, a definite diagnosis of ventricular aneurysm could made.

D. Those in whom there was definite evidence of congesti failure.

Since the patients were divided into four groups on th basis of both subjective and objective findings, they fa into 16 separate subgroups, ranging from 1A to 4 (Table 1). For example, Group 1A includes *those* wh made a complete functional recovery, and who showe normal findings electrocardiographically and roentgen logically. Group 3C includes those who made a poor functional recovery, and who showed marked enlargement of the heart, probably paradoxical pulsation, and advanced electrocardiographic changes.

RESULTS

Findings in Coronary Occlusion.—Of the 412 patients, 297 are alive and 115 are dead; the mortality rate was 28% (Table 1). Four are known to have died of extracardiac causes. It will be seen (Tables 1 and 2) that 154 patients (37.5% of the 412 patients followed) have made a complete functional recovery (Groups 1A, 1B, 1C). Many of the patients who recovered completely were free of symptoms, except for a short period of anxiety and weakness, after the acute attack had subsided. Of the others who survived, 115 (28% of all the patients) made a satisfactory recovery but experienced occasional angina on effort (Group 2).

3D	2	0
4B	1	3
4C	2	5
4D	7	10
	28	35
Total	297	115

Of the 154 who had made a complete functional recovery, 26 had hearts of normal size and normal electrocardiograms (Group 1A), 102 had some enlargement of the heart or an abnormal electrocardiogram (Group 1B), and 26 had marked enlargement of the heart or advanced changes in the electrocardiogram (Group 1C). Although the patients in this latter group were asymptomatic, 10 of the 26 presented definite evidence of ventricular aneurysm; i. e., a bulge in the ventricular shadow, and large Q waves and persistent RS-T elevation in the electrocardiograms. In two patients with a large heart, the electrocardiogram was interpreted as being within normal limits.

Thirty-eight (25%) of the 154 survivors, who made a complete functional recovery (Group 1—A, B, C), have lived more than 10 years since the attack, and 61 (40%) have lived more than 5 years (Table 2). The length of survival was slightly greater in Group 1A than in Groups 1B and 1C.

The average age of onset of the coronary occlusion in those who had made a complete functional recovery was 52 years; the youngest patient was 26, the oldest 77. Forty of the 154 patients were obese, and only three had diabetes. Following the occlusion, 19 had a systolic pressure of 170 or more, or a diastolic pressure of 100 or more. Seventy-five patients had an anterior infarction and 74 a posterior infarction. The heart was normal in size in 75% of the patients, and the electrocardiogram was normal in 20%. Reversal of pulsation occurred in 18%. The "two-step" exercise electrocardiogram was positive in 11 patients, and negative in 23. The ballistocardiogram was abnormal in 18 patients. normal in 6, and borderline in 1.

TABLE 2.—*Complete Recovery in Coronary Occlusion: Group 1 (A, B, C) Living and Dead (180 Cases or 44% of Total Series)*

Living	154
Dead	26
Mortality Rate	19%
Living	
After 10 yr	38 (25%)
After 5 yr	61 (40%)
Dead	
Lived over 10 yr	12 (46%)
Lived over 5 yr	18 (77%)
Lived under 5 yr	6 (23%)

It was possible to learn of the activities of 128 of the 154 patients who had made a complete functional recovery. Seventy-seven (60%) were working full-time, at their original job or professions (Table 3). (This was particularly true of physicians.) Thirty-one (23%) were doing moderate or part-time work, and 20 (17%) were not working. At least half of the latter group could have worked had it been necessary for them to do so. All the patients in Group 1A were working, and practically all were doing full-time work. It is notable that many of the patients in Group 1C were also working full-time, and only a small minority were not working at all. The list of occupations was very varied and included executives and business men, judges, lawyers, doctors, storekeepers, clerks, salesmen, plumbers, electricians, tailors, and waiters. Because the majority of the patients were seen in private practice, there were few laborers. One patient resumed his job as cable splicer in three months.

3D	0	5	5
4B	0	0	1
4C	0	0	3
4D	0	2	3

In four patients who had made a complete functional recovery a second coronary occlusion developed after a number of years. Seven experienced episodes of acute coronary insufficiency. In each instance the patient again became free of symptoms after the acute attack had passed.

In addition to the 154 living patients who have made a complete functional recovery, 26 others had made a complete recovery but subsequently died of another occlusion or of acute coronary insufficiency (Table 1).

Thus, the mortality rate in Group 1 (A, B, C) was only 14.4%; it was 28% in all the cases followed, and 38.5% in Groups 2, 3, and 4 (Table 4). The mortality rate was almost as low in Group 1C (those with functional recovery, but with marked electrocardiographic changes and/or cardiac enlargement) as in Group 1A. It is important to note that, of the 26 patients who recovered completely (Group 1) and later died, 12 (46%) survived for more than 10 years, and 18 (77%) for more than five years. Only six patients (23%) in this group lived for less than five years after the attack (Table 2).

Since the prognosis following coronary occlusion is said to be better in young persons, we studied separately those patients whose attacks occurred before the age of 45. There were 48 such patients, including one 35-year-old woman, in whom there was no history of hypertension, diabetes, or gallbladder disease. The mortality rate among these younger patients was lower (23%), the incidence of complete functional recovery was higher (42%), and the period of survival was longer, than among the older age group, which consisted of 364 patients whose attacks occurred after age 45, in which the mortality rate was 28.5%, and the complete functional recovery was 37%. Twenty-three patients under 45 made a complete functional recovery, and three died.

Total	128	13 (9%)

Findings in Coronary Insufficiency.—One hundred forty-seven patients with acute coronary insufficiency were observed. In approximately 60% the attack occurred spontaneously. In the rest, the attack was associated with acute gastric hemorrhage, effort, excitement, operation, tachycardia, acute gastroenteritis, or pulmonary infection. Six patients died during the acute attack. One hundred forty-one have been followed for from 6 months to 20 years; of these, 128 are alive, and 13 have died—a mortality rate of 9% (Table 5). This rate is one-third of that found in the patients with coronary occlusion. In 80 patients (57%) the heart was normal in size, and the electrocardiogram was normal (Groups 1A, 2A, and 3A). In the patients with coronary occlusion, the percentage with such normal findings was only 9.

Seventy-three (52%) of the coronary insufficiency patients made a complete functional recovery (Groups 1A and 1B). Sixteen (22%) of these have lived for more than 10 years after the episode, and 23 (31%) for more than 5 years. In 71% of the patients the size of the heart and the electrocardiogram findings were normal. The two-step exercise electrocardiogram was positive in six patients and negative in eight. The ballistocardiogram was positive in four patients and negative in the same number. In four patients a coronary occlusion developed later, and two others experienced another episode of coronary insufficiency from which they again recovered completely.

Among the patients who died subsequently three had made a complete functional recovery, one for 15 years and two for 1 year.

Fourteen of the patients had the attack of acute coronary insufficiency before they were 45 years old. All of them made a complete recovery. In only one did an abnormal electrocardiogram persist.

COMMENT

It is apparent that the prognosis in patients who survive an attack of coronary occlusion is much better than has generally been expected. In our series, almost two-fifths of the patients have made a complete functional recovery, and one-fourth of these have already lived for more than 10 years. In addition, a fair proportion of the patients (6.5%) made a complete functional recovery and lived for many years before dying of another acute attack of coronary occlusion or insufficiency. In fact, of the 180 who had recovered completely from the acute attack, less than 20% have died; only six patients died in less than five years. Our results indicate that a patient who makes a complete recovery from coronary occlusion has a 95% chance of living for more than 5 years, and a good chance of surviving for more than 10 years. Nevertheless, another occlusion or episode of acute coronary insufficiency may develop after many years.

The majority of our patients were seen in private practice. Therefore, our findings apply particularly to persons in the upper economic strata. In such patients coronary attacks are recognized earlier and treated with more care than in those in the lower economic group. However, a comparison of the findings in the ward and private practice patients demonstrated similar trends in both groups, and we believe that our findings hold for all classes of patients.

Of particular interest were the 26 patients who had made a complete functional recovery, and yet presented enlargement of the heart and advanced changes in the electrocardiogram (Group 1C). A definite ventricular aneurysm was present in 10; in the remainder there was usually paradoxical pulsation. The benign course of ventricular aneurysm in many patients is well known, and is borne out in our patients, many of whom lived more than 10 years and have been working. One of them, a physician, is quite well after 29 years. Only four patients in this group have died. The best prognostic guide following coronary occlusion appears to be the patient's symptoms, i. e., anginal pain or dyspnea, rather than the size of the heart or the electrocardiogram.

A significant number of the remaining patients were idle voluntarily, because they thought that this was the proper course to pursue following coronary occlusion. Most of those who worked did full-time work at their previous jobs or professions or were engaged in somewhat similar work. It is true, of course, that many of them restricted their activities to some extent, or reduced the number of working hours, often on the advice of their physicians. For example, some physicians abandoned private practice, and took positions in industry or in teaching institutions.

From our findings it is clear that many persons who recover from a coronary occlusion are capable of resuming their places in all the various phases of industry. Many can perform their usual work, as do persons without coronary disease; others may have to find different work or to modify the work, as may be necessary. Periodic physical examinations of these patients, especially, should be made. In general, it is a good policy not to assign persons with coronary disease to jobs in which the sudden occurrence of anginal pain will endanger the lives of other persons.

Instead of discouraging patients who have recovered from a coronary occlusion from working, the physician should encourage them to resume some form of work as soon as this is physically possible. Most patients who make a complete functional recovery are able to return to work within three to six months after the attack; not infrequently they have done so before three months have elapsed. Psychologically, it is essential for these persons to be employed, because after a heart attack they usually develop considerable anxiety concerning their state of health. At times this becomes very serious and is far more damaging than is the cardiac disease itself. This state of mind may exist even in those who have made a complete functional recovery. Idleness merely exaggerates this tendency to anxiety and self-pity, whereas gainful employment serves to restore the patient's mental well-being. It is not uncommon to find that atypical chest pains and other symptoms disappear when these patients go back to work.

In considering the outlook following coronary occlusion, it is important to remember that the initial attack usually occurs after the age of 50; therefore, if a patient survives for more than 5 or 10 years, he will have approached his normal life span; and, since most survivors are able to work, relatively few working years will have been lost.

In our series, the patients in whom coronary occlusion developed before the age of 45 fared better than did those in the older age group, but the difference was less striking than had been expected.

The location of the infarct, whether anterior or posterior, did not play a role in the subsequent course of the life of the patients. The statement is not infrequently made, based merely on a clinical impression, that posterior infarction has a better prognosis during and following the acute attack. This opinion is not borne out in our series.

The patients who made a complete functional recovery following coronary occlusion not infrequently had a normal two-step exercise electrocardiogram, but usually had an abnormal ballistocardiogram. It must be remembered, however, that the ballistocardiogram is frequently abnormal in older persons without any evidence of heart disease. Therefore, the record must be evaluated with great care. The two tests often were not correlated. Following 100 attacks of coronary occlusion, Moser and his co-workers [7] found the ballistocardiogram normal in 20% of the patients. These patients had made a good functional recovery. We have occasionally encountered a normal test even in patients with ventricular aneurysm. An abnormal exercise electrocardiogram or ballistocardiogram may be the only objective evidence of coronary disease, or of a previous coronary occlusion.

As was to be expected, the patients with acute coronary insufficiency fared better than did those with coronary occlusion. More than half of these patients made a complete functional recovery, and over 95% of them are still living. The recognition of coronary insufficiency as an entity became common much later than did that of coronary occlusion; therefore, the follow-up period of patients who suffered from the former has been shorter than that of patients with coronary occlusion. Our findings suggest, however, that survival after an attack of coronary insufficiency is longer than that after coronary occlusion. Following complete recovery from coronary insufficiency, the heart size and electrocardiogram are normal in three-fifths of the patients.

The results of this follow-up study are of significance to the doctor, the patient and his family, and to industry. Coronary disease is the most frequent heart affection and the most important cause of illness; and it will continue to increase as a result of the lengthening life span and the greater numbers of middle-aged and old people in the population. Furthermore, a large number of persons who sustain a coronary occlusion are in the most active and productive period of their lives.

The general attitude to be adopted toward the future conduct of those who have survived an acute coronary occlusion or insufficiency constitutes a major economic and psychological problem of our time. In the past, the pessimism of both the physician and the lay person has led to a great deal of psychological and economic invalidism. This approach is no longer advisable. In view of the data which we now have, both the doctor and the patient may honestly confront coronary occlusion, before and after the attack, optimistically and positively. It should be emphasized that most patients survive the acute attack, and that many make a complete functional recovery and are able to resume gainful employment and approximate their normal life span. They should be encouraged to lead as normal lives as possible, avoiding excessive mental and physical strain. In this way we shall send many more patients back to a happy life rather than into the exile of invalidism and despondency.

CONCLUSIONS

A study has been made of the progress of 412 patients after acute coronary occlusion and 141 patients after acute coronary insufficiency. The patients were divided into groups on the basis of symptoms and activity and according to the objective findings.

---

[7] Moser, M.; Pordy, L.; Chesky, K.; Taymor, R. C., and Master, A. M.: The Ballistocardiogram in Myocardial Infarction: A Study of 100 Cases, unpublished data.

About two-fifths of the patients with coronary occlusion have made a complete recovery. Another quarter of the patients made a satisfactory recovery, but experienced occasional angina with effort.

Twenty-five per cent of the patients who recovered completely have lived more than 10 years and 40% more than 5 years. Eighty-three per cent are employed, 60% at full-time work. Only three patients had diabetes; obesity was not common. Whether the infarct had been anterior or posterior did not influence the future course of the patient.

In 26 patients the size and pulsations of the heart and the electrocardiogram were normal. In some of these the two-step exercise electrocardiogram and ballistocardiogram were abnormal.

Twenty-six patients had recovered complete function although the heart was greatly enlarged and/or the electrocardiogram was very abnormal. In 10 patients definite evidence of ventricular aneurysm was present; one of these patients is well 29 years after the attack. Following coronary occlusion, the best prognostic guide appears to be the patient's symptoms rather than the objective findings.

Twenty-six additional patients made a complete functional recovery but died subsequently, the great majority after 5 or 10 years. Of all the patients who made a complete functional recovery, only six (3%) died in less than five years. The mortality rate in patients who made complete recovery was less than half that found in thos who continued to have symptoms.

Coronary occlusion or insufficiency may recur afte many years of complete functional recovery. Such incidents occurred in 11 patients who again recovered completely.

Patients in whom the attack occurred before the ag of 45 did only slightly better than did the older patient as determined by the number who made complete recoveries and by the mortality rate.

The prognosis following acute coronary insufficienc was even better than that after coronary occlusion. Ov half the former patients made a complete recovery an only 4% of them have died.

Following coronary insufficiency the size of the hea and the electrocardiogram are normal in three-fifths the patients.

The majority of patients who survive an attack coronary occlusion or insufficiency are able to lead fair normal lives and to be gainfully employed. They shou be encouraged to do so as soon as it is physically po sible. In this way it will be possible to avoid much the psychological and physical invalidism which no exists.

OPERATION FOR CORONARY ARTERY DISEASE

Claude S. Beck, M.D., Cleveland, Richard S. Hahn, M.D., San Francisco, David S. Leighninger, M.D., Cleveland
and
Ferdinand F. McAllister, M.D., New York

Operation for coronary artery disease was developed on dogs by Drs. Eugene Stanton, William Batiuchok, Eugene Leiter, Maurice Kim, and the authors of this paper.[1] The developmental problems in the surgical technique, however, will not be discussed in this paper. This operation introduces new problems in the physiology of circulation in the heart, and the answers to some of these problems cannot be given at the present time. The operation is giving fresh impetus to the study of circulation in the heart.

DESCRIPTION OF OPERATION

The operation is done in two stages. The first stage consists in the placement of a free vein graft between the coronary sinus and the aorta. The second stage of the operation consists of partial ligation of the coronary sinus at the ostium of the sinus into the right auricle. The purpose of the operation is to deliver oxygenated blo into the myocardium. We have evidence to show th oxygenated blood delivered into the venous system the heart can protect the heart against occlusion of major coronary artery.

The graft is taken from the basilic, cephalic or jug lar vein either immediately before or on the afterno before operation. The patient is placed on the right sid An intercostal incision is made between the left seven and eighth ribs. The pericardium is opened. Two piec of polyacrylonitrile fiber ("orlon") are placed aroun the coronary sinus at a point where the sinus enters th right auricle. Polyacrylonitrile fiber is used because maintains its tensile strength after having been in the bod several weeks. These polyacrylonitrile threads are tucke away between the pericardium and heart to be used the second stage of the operation. A special clamp placed on the coronary sinus, and the sinus is opene about 5 mm. One end of the vein graft is sutured to th sinus, and the clamp is removed from the sinus. A sit for tapping the aorta is selected, and a special clamp applied to the aorta. The aorta is opened approximatel 4.5 to 5.0 mm. The free end of the vein graft is suture to the aorta. The clamp is removed from the aorta. Th pericardium is closed by sutures. The chest wall is closed The first stage of the operation can be done in approximately two and one-half hours.

This work was supported by grants from the United States Public Health Service and the Cleveland Heart Society.

From the Department of Surgery, Western Reserve University School of Medicine and the University Hospitals, Cleveland.

Read before the Section on General Practice at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

[1] (*a*) Beck, C. S.; Stanton, E.; Batiuchok, W., and Leiter, E.: Revascularization of Heart by Graft of Systemic Artery into Coronary Sinus, J. A. M. A. **137**: 436 (May 29) 1948. (*b*) Beck, C. S.: Revascularization of the Heart, Ann. Surg. **128**: 854 (Oct.) 1948. (*c*) Beck, C. S.: Revascularization of the Heart, Surgery **26**: 82 (July) 1949. (*d*) McAllister, F. F.; Leighninger, D., and Beck, C. S.: Revascularization of the Heart by Vein Graft From Aorta to Coronary Sinus, Ann. Surg. **133**: 153 (Feb.) 1951.

The second stage of the operation is done three weeks after the first stage. The scar of the first stage is incised, and the chest is opened. The pericardium is opened. The polyacrylonitrile threads are picked up and freed to the point where they encircle the sinus. A probe measuring 2 mm. in diameter is placed on the sinus, and the polyacrylonitrile thread is tied on the probe. The probe is removed. This produces partial occlusion of the sinus. The pericardium is closed. The chest wall is closed. The second stage of the operation can be done in one and one-half hours.

OBSERVATIONS AT OPERATION

The first stage of the operation provides a fistula from the aorta through the graft and into the coronary sinus. Most of the blood escapes into the right auricle. The flow is rapid as in an arteriovenous fistula elsewhere. A thrill is palpable over the graft. In several patients with coronary artery disease pink blood could be seen in the veins on the posterior aspect of the heart at the first stage of the operation. This pinkening of the venous system became more marked if the sinus were occluded temporarily by the polyacrylonitrile threads. This observation was not made in normal dogs with normal coronary artery inflow. The explanation for this is not given, but the suggestion is made that in patients the pressure in the venous system of the heart might be reduced by the coronary artery inflow disease. A reduced pressure in the venous system should encourage retrograde flow from the coronary sinus into its venous tributaries. The presence of coronary artery disease, therefore, is favorable to retrograde flow in the veins and in this respect to the success of the operation in patients.

TESTS OF BENEFIT FROM OPERATION

Before this operation was applied to patients with coronary artery disease, it was necessary to test the benefit on dogs provided by operation. The test worked out by Beck and his associates in the 1932 to 1942 period consisted of ligating the descending ramus of the left coronary artery at its origin in one step. The artery was dissected. No branches were missed. Aseptic technique was used, and the delayed deaths occurring weeks later were included. Among normal dogs the mortality rate from this ligation was 70%, and the recovery rate was 30%. All dogs that lived after ligation of the artery showed a definite infarct in the heart. In most specimens the infarct was large. Mortality and infarction provided a basis on which benefit could be determined.

The test was applied to 37 dogs in which arterial blood was directed into the coronary sinus and in which the coronary sinus was either completely or partially ligated at its ostium in the right auricle. The source of the arterial blood was either from the carotid artery or from the aorta by way of the vein graft. In this group of 37 dogs, 33 lived and 4 died after ligation of the test artery.[2]

For comparison the test ligation was done in 10 dogs in which the graft was occluded by thrombosis. These experiments were identical to the others except that the graft was not patent. Seven dogs died and three recovered. This is the same mortality rate as occurred in our series of normal control dogs. In this series the mortality was 70% and the recovery rate 30%.[3] On the basis of 37 control dogs, there would have been 11 that lived and 26 that died after ligation of the test artery.

The destruction of heart muscle was equally significant. The infarcts in the control group were always definite and frequently extensive, involving the entire thickness of the ventricular wall. A gross infarct was present in every specimen in the control group. Among the dogs with patent graft a gross infarct was absent in over half the specimens. In most of the other specimens the amount of destruction was limited to rather small areas. It was also possible to make these ligations without significant changes in the electrocardiogram.[4]

According to these experiments, the operation protects the dog against death and destruction of heart muscle after ligation of the descending ramus of the left coronary artery. Protection against death and infarction are the two factors on which this operation is based. It seems reasonable to assume that oxygenated blood must enter the capillary bed of the myocardium where oxygen exchange is possible. If this does not occur, how could this protection be explained? This is only indirect evidence that blood enters the capillary bed, but it appears to be the only assumption that can be made.

It might be stated that additional coronary arteries were ligated, and the dogs were active and appeared in good health.[2] In two dogs all coronary arteries were occluded except the septal branch. In one dog all coronary arteries were occluded except the circumflex artery, which was occluded to a lumen of 1.5 mm. We did one experiment in which all coronary arteries were occluded, and the heart kept beating for 35 minutes. There was considerable mortality in accomplishing these extensive occlusions, but the fact remains that it was possible to make them. In our opinion such occlusions as these are not possible in the normal unprotected heart.

Additional evidence that blood flows in a retrograde direction and probably through the capillary bed is given by the following experiment, which was repeated in several cases. The circumflex artery is dissected free, and the proximal end is ligated in a dog in which both stages of the operation have been done previously. The flow from the distal end of the severed artery is observed. When the graft from the aorta to the coronary sinus is clamped off, this blood from the severed artery is red and flows in small amount. It is arterial blood which, no doubt, enters the circumflex artery from other coronary arteries by way of intercoronary channels. When the graft is open so that red blood enters the sinus from the aorta, the retrograde flow from the severed circumflex artery is blue. It flows in large amount and can build up a higher pressure. This observation was first made by one of us (R. S. H.) in our laboratory. The retrograde flow is augmented because of aortic inflow from the graft. It is blue because the oxygen has been taken out, and in order for this to occur, it must have traversed a capillary bed where oxygen exchange is possible. We believe that this is strong evidence, together with the protection against mortality and infarction, that red blood can traverse the capillary bed in a retrograde direction where it is beneficial. Along with this increased retrograde flow from the graft, there is some electrocardiographic evidence of improvement when the graft is open.[5]

SIDE EFFECTS OF OPERATION

The operation involves an arteriovenous fistula by leaving the ostium of the coronary sinus partially open. In our experiments the sinus was reduced to a lumen of approximately 3.0 to 3.5 mm. In patients with coronary artery disease the lumen was reduced to about 2 mm. A considerable quantity of blood can flow through such an opening, but it would appear that the flow is not great enough to produce clinical manifestations of a fistula, except a murmur. This aspect of the operation will bear further observation. One might expect the development of an extensive drainage by way of the anterior cardiac veins and the middle cardiac vein. The anterior cardiac veins enter directly into the right auricle.[6] The middle cardiac vein enters the coronary sinus between the polyacrylonitrile fiber ligature and the auricle so that it is not partially occluded. In some specimens this vein enters directly into the right auricle. Our observations on venous drainage are based on the experimental work. We expected to find large drainage channels. In general, these drainage channels did not appear to become an important run-off for blood. Our experience to date is that the arteriovenous fistula effect has not been a problem, but it remains a subject for study in patients.

There were three complications which could have prevented the satisfactory outcome of the operation. These were (1) hemorrhage into the heart muscle, (2) thrombosis in the graft, and (3) intimal thickening of the veins of the heart. All three of these complications were solved in the same way, namely, by making the operation into a two-stage procedure and by providing an exit for blood by only partially occluding the coronary sinus.[1d] A stagnant flow of blood must be avoided. The flow through the graft and veins must be active. The walls of the veins thicken after they are exposed to the increased pressure produced by the first procedure of the operation, and the veins tolerate the pressure satisfactorily when the pressure is further increased by the second procedure. After the veins have been exposed to the pressure of arterial inflow, they take on the appearance of the arteries.[7]

APPLICATION TO PATIENTS WITH CORONARY ARTERY DISEASE

This aspect of the work is divided into an early and a late period. In the early period, dating approximatel from January, 1948, to December, 1950, only patient who were entirely or almost entirely incapacitated from work were accepted for operation. These patients ha extensive and irreversible damage in the heart. No doub most of them were poor risks for any operation, and indeed, the damage in the heart muscle in some of thes patients was such as to make questionable the degree o benefit that might have taken place if the patient ha recovered from the operation. In this group of 12 patient there were eight deaths and four recoveries. Anothe factor in the mortality in this group, aside from extensive disease, was the technical aspects of the operation Regardless of experimental background, the operatio on patients had still to be developed. There were problems which had to be solved, and experience was necessary for their solution.

In addition to the mortality in this group of advance cases,[8] there were several additional deaths. One patien died in the hospital while preoperative studies were bein carried out; no operation was done. Several patients die during the few days it took to have them admitted to th hospital. One patient died during a test anesthetic procedure without operation. It is obvious that the patient whom we accepted for operation had severe disease They were not good candidates for operation. The ris was great, and if the patient survived the operation, th amount of damage already in the heart probably coul impair the clinical result. Concerning this aspect of th problem, an important contribution was made by Dr George Geckeler and Charles Bailey, of Philadelphi They urge that we accept stronger patients for operatio and refuse to accept patients who are severely incapac tated. They pointed out that it probably would not possible to establish this operation if we accepted ba risk patients. In this event, it would not be possible give to the better-risk group of patients with corona artery disease the potential benefit that the operatio carries. Therefore, we decided not to accept for operatio patients who were (1) totally incapacitated, (2) had a enlarged heart, (3) had heart failure, (4) had sever disease in the aorta, or (5) had a systolic blood pressur higher than 160 mm. of mercury. The record improved We deviated from this program after we had a record o one death out of 19 patients operated on and accepte several patients who were incapacitated. We learne again that such patients are not satisfactory candidate for the operation.

REPORT OF CASES

Case 1.—G. P. a man, 51, was operated on Jan. 31, 1951. The posterior aspect of the left ventricle showed an infarct 4 to 5 cm. in diameter. The common left coronary artery was palpable. The descending and circumflex arteries were palpable. These arteries felt as though they were calcified. Because of the extensive disease in the heart, he was classified as a "bad risk patient." The graft was placed between the coronary sinus and the aorta without difficulty. Blood pressure was well maintained. Two polyacrylonitrile threads were placed around the ostium of the sinus. These were not tied. The veins on the posterior surface of the heart became pink when the coronary sinus was temporarily occluded. There was an immediate inflow of red blood into the veins. Operation was again done Feb. 22,

[8] The protocols on the early series of cases are omitted from THE JOURNAL because of limitation of space. They will appear in the authors' reprints.

1951. The coronary sinus was partially occluded to a lumen of 2.5 mm. There was a slight pinkening of the veins after this was done. This patient states that he has been completely free of pain and has taken no medicament since operation. He is enthusiastic about the result.

CASE 2.—H. F., a woman, 41, was operated on Jan. 17, 1951. Both major branches of the left coronary artery were palpable and seemed to be calcified. The graft was placed without difficulty. After the anastomosis was completed, a flash of red blood could be seen in the veins with each systole. Temporary occlusion of the sinus pinkened the veins. Operation was done again Feb. 7, 1951. The coronary sinus was ligated at the ostium to about 3 mm. The veins were pink after this was done. The patient went through both operations satisfactorily. She had episodes of heart failure before operation. She reports favorably on the result and claims that since the operation she has had no anginal pain and that her activities have increased.

CASE 3.—G. G., a man, 42, was operated on Jan. 22, 1951. He was placed in the bad-risk group. He had practically no tolerance for exercise and was taking considerable morphine. The graft was placed without difficulty. The veins became pink when the sinus was temporarily occluded. Operation was done again Feb. 19, 1951. The sinus was occluded to a diameter of 2.5 mm. A murmur was heard. It is difficult to evaluate the result in this patient. He thinks he is better, but he is not strong and remains an invalid. Additional time will be necessary before evaluation can be made.

CASE 4.—F. S., a man, 59, was operated on Feb. 1, 1951. The descending and circumflex arteries were palpable and probably calcified. The graft was placed without difficulty. It was patent. Temporary occlusion of the sinus pinkened the veins. It also stopped the heart momentarily. No murmur could be heard after the operation. Exploration was done Feb. 23, 1951. The graft was thrombosed. The surface of the heart and the parietal pericardium were gently abraded, and 0.2 gm. of powdered asbestos was applied to these surfaces. This patient had not worked for eight months. He is now planning to return to work. He has pain in his incision. The result cannot be evaluated yet.

CASE 5.—M. S., a man, 46, was operated on Feb. 13, 1951. The descending and circumflex arteries were easily palpable. The graft was placed without difficulty. A good retrograde flow in the veins occurred when the sinus was temporarily occluded. Not only did the veins become pink, but the heart muscle did also. Operation was done again March 6, 1951. The sinus was occluded to a diameter of 2 mm. There was a flash of pink blood into the veins with each systole. The patient was seen May 18. A murmur was present. This patient returned to work. He states that he has had no pain and has taken no medicament since operation. He is highly pleased with the result.

CASE 6.—R. L., was a man, 43. The first step of the operation was done April 2, 1951. A graft of vein was placed between the coronary sinus and the aorta. The veins became pink when the sinus was temporarily occluded. The second stage was done April 20, 1951. The patient is free of pain and has returned to work. He is enthusiastic about the result.

CASE 7.—J. P., was a man, 44. The first stage of the operation was done May 5, 1951. Small ecchymotic spots appeared in the epicardial fat when the sinus was momentarily occluded. This was probably due to rupture of capillaries, and the observation suggests that the capillaries could not tolerate a high retrograde venous pressure. The second stage was done June 1, 1951. It was interesting that the heart tolerated several tests of complete sinus occlusion. The sinus was occluded to a lumen of 3 mm. The patient tolerated the operation well. This patient has had no pain and has taken no medicament since operation. He has returned to work. He is enthusiastic about the result.

CASE 8.—M. F., a man, 44 was operated on Dec. 11, 1950.[9] An infarct was found on the posterior aspect of the left ventricle. A vein graft was placed between the coronary sinus and the aorta. The second stage of the operation was done January 4, 1951. The sinus was partially occluded. The patient has had no angina since discharge. He returned to work on March 5 and is working full time for the first time since January, 1950. His heart is normal size, and the murmur can easily be heard. His electrocardiogram, while not normal, is better than any during the six months preceding surgery.

CASE 9.—H. F. was a women, 48. In April, 1950, she was hospitalized with anterior and posterior myocardial infarction. Operation was done Dec. 12, 1950. A vein graft was placed between the coronary sinus and the aorta. There was a good thrill and pulsation over the graft. The systolic murmur heard after operation gradually disappeared before the second stage was done on Jan. 5, 1951. At this operation a large amount of clotted blood was found in the chest, and there was evidence of a low-grade infection. The graft was not patent. The coronary sinus was ligated. A report several months after operation stated that the patient has had very little angina and is more active than before operation. She has a grade I murmur, but there has been no recanalization.

CASE 10.—E. T., a woman, 45, was operated on Dec. 12, 1950. The basilic vein was not satisfactory, and a segment of anterior malleolar vein was used. The graft was smaller than usual. When the sinus was temporarily occluded the veins in the heart became pink. The second operation was done Jan. 3, 1951. The graft was thrombosed. There was no murmur. An attempt was made to place another graft between the sinus and the aorta, but we did not succeed in doing this. According to subsequent report, the patient's condition is about the same as before operation.

CASE 11.—C. K. was a man, 58. Operation was attempted Dec. 13, 1950. The patient was almost incapacitated. He had an enlarged heart and a dilated and tortuous aorta. Diffuse infarction was visible in the posterior part of the left ventricle. The descending and circumflex coronary arteries were readily palpable and were calcified. The heart beat was weak; the systolic pressure was 70 mm. of mercury. Despite the use of phenylephrine (neo-synephrine®), the pressure could not be maintained. Ventricular fibrillation developed, and the patient died. This patient was not a satisfactory condidate for operation. Extensive disease was present in the heart and aorta.

CASE 12.—S. A., a man, 40, was operated on Feb. 21, 1951.[10] On the posterior aspect of the left ventricle several small infarcts were observed about 0.5 to 1.0 cm. in diameter. The descending ramus of the left coronary artery was easily palpable and probably calcified. A vein graft from the arm was placed between the coronary sinus and the aorta. The veins became pink when the sinus was temporarily occluded. The second stage was done March 15, 1951. The ostium of the sinus was ligated to a diameter of 2.5 mm. This patient has returned to work. He is almost completely free of pain and takes no medicament. He is pleased with the result.

CASE 13.—R. B. was a man, 36. Clinically he had two infarcts, one anterior and one posterior. Operation was done Feb. 26, 1951. An initial fall in blood pressure delayed the operation 30 minutes. A posterior infarct about 3 cm. was observed. The circumflex artery was easily palpable and was probably calcified. A graft from the cephalic vein was placed between the coronary sinus and the aorta. The veins filled with pink blood when the sinus was temporarily occluded. The second stage was done March 26, 1951. The operation was delayed 45 minutes because of low blood pressure. The sinus was partially ligated to 2 mm. Pink blood was observed in the veins. The patient had severe damage in the heart. He was incapacitated, and the prognosis was bad. Since operation he has been almost completely free of pain and has returned to work. He takes no medicament. He is pleased with the result.

CASE 14.—W. M., a man, 59, was operated on March 5, 1951. A segment of vein was taken from the elbow and placed between the coronary sinus and the aorta. The parietal pericardium was adherent to the heart. These adhesions were separated. The second stage was done March 27, 1951. There was no pulsation in the graft. It was occluded by thrombosis. The sinus was completely ligated, and 0.2 gm. of powdered asbestos was placed between the pericardium and the heart. Several weeks after operation the patient coughed up blood and later had a severe pulmonary hemorrhage. The patient died from the hemorrhage.

---

[9] The operations in Cases 8 through 11 were done at Permanente Hospital, Oakland, Calif. Dr. Cecil Cutting and Dr. David DeKruif studied and reported on these cases.

[10] The operations in Cases 12 through 16 were done at the Veterans Administration Hospital, Cleveland. Dr. Harold Schwartz aided us in this study.

Examination showed that the graft had become recanalized and that it ruptured in three areas where it was adherent to the lung. The explanation for this cannot be given. The coronary arteries showed minimal or no disease. Probably the pericarditis was a factor in producing electrocardiographic changes. The graft showed necrosis and inflammation.

Case 15.—J. W., a man, 56, was operated on April 16, 1951. A vein graft was placed between the coronary sinus and the aorta. The veins filled with pink blood when the sinus was temporarily occluded. On May 7, 1951, the sinus was partially occluded. The veins became pink, as also did the myocardium. About four hours after the operation was completed, the systolic blood pressure rose to 200 mm. of mercury and a left hemiplegia was noticed. The patient died the following day. Autopsy showed the graft to be patent. The sinus was partially occluded. The coronary arteries were severely diseased, partially occluded, and calcified. Generalized fibrosis was found in the myocardium. A pituitary adenoma was found. Ischemic necrosis of the right cerebral cortex was found without occlusion of cerebral arteries or the carotid artery. The cardiac end of the stomach showed extensive ischemic necrosis with perforation. This was an acute process probably related to the pituitary tumor. There was some subepicardial hemorrhage in the heart muscle, which probably occurred when the systolic blood pressure rose to 200 mm. of mercury several hours after the operation was completed.

Case 16.—L. F., a man, 42, was operated on April 19, 1951. The blood pressure fell to a critical level. The incision was delayed. The systolic pressure rose to about 90 mm. of mercury, and the chest was opened. The pericardium was opened. A large infarct was seen on the posterior surface of the left ventricle. The heart was not touched. The systolic pressure fell to 60 mm. of mercury, and the beat was weak. The blood pressure did not rise, and it was decided to close the chest and not to proceed with the operation. The patient died the following day. He had severe disease in the heart and was incapacitated. He was not a satisfactory candidate for operation.

Case 17.—J. C., a man, 42, was operated on Jan. 31, 1951.[11] The common left coronary artery could be palpated and was probably calcified. A vein graft was placed between the coronary sinus and the aorta. The patient was improved clinically after this operation. He felt so well that he did not believe the second stage was necessary. The second stage of the operation was done Feb. 28, 1951. The coronary sinus was ligated down to 2.5 mm. Immediately after this was done, the venous oozing from the surface of the heart changed to pink blood. The veins became pink, as also did the heart muscle. A murmur could be heard. This patient has returned to work, has had no pain, and takes no drugs. Recently he walked 4 miles. Before operation he could walk about a city block.

Case 18.—W. C., a man, 44, was operated on Feb. 28, 1951. An infarct was seen on the posterior surface of the left ventricle. It was adherent to the parietal pericardium. The circumflex coronary artery was palpable and was probably calcified. An attempt was made to make an anastomosis between the coronary sinus and the graft of vein. In doing this the sinus was torn. The sinus was ligated. The epicardium and the lining of the parietal pericardium were gently abraded, and 0.2 gm. of powdered asbestos was applied to these surfaces. The patient believes that this pain has been definitely lessened by the operation.

Case 19.—A. A., a man, 38, was operated on March 21, 1951. The descending ramus of the left coronary artery could be palpated and was probably calcified. A graft of vein was placed between the coronary sinus and the aorta. When the ostium of the sinus was temporarily occluded, the veins of the heart became pink. The second stage of the operation was done April 11, 1951. The graft was occluded by a thrombus. The epicardium and parietal pericardium were abraded, and 0.2 gm. of powdered asbestos was applied to these structures. The patient has been discharged from the hospital, but no statement can be made con[illegible]ning the benefit of the operation.

Case 20.—J. T., a man, 42, was operated on March 21, 1951. Areas of infarction were seen on the posterior surface of the left ventricle. The descending ramus of the left coronary artery was easily palpable and was probably calcified. The disease in the heart seemed to be extensive. A graft of vein was placed between the coronary sinus and the aorta. The veins became pink when the sinus was temporarily occluded. The second stage of the operation was done April 11, 1951. The coronary sinus was partially ligated to a lumen of 2 mm. The veins of the heart became pink, as also did the color of the heart. Venous oozing immediately became pink oozing from the surface of the heart. This patient's pain has not completely disappeared, but he states that he feels definitely better. He has some incisional pain. He can walk three city blocks; whereas, before operation approximately one-half block was as far as he could go. Before operation this patient had some acute attacks of coronary insufficiency.

Case 21.—W. K., a man, 39, was operated on April 11, 1951. The systolic blood pressure fell to 80 mm. of mercury as the chest was being opened. The operation was discontinued for a period of time until the pressure rose to a higher level. A large infarct, measuring 5 cm. in diameter, was observed on the posterior aspect of the right ventricle. Small areas of fibrosis were seen elsewhere. Both the descending and circumflex coronary arteries were palpable and probably calcified. A vein graft was placed between the coronary sinus and the aorta. The heart beat was rapid. The operation was completed. The patient died five hours after the operation was completed. This patient had episodes of failure and paroxysmal auricular tachycardia with premature auricular contractions. He had been taking quinidine and digitalis. He was a bad risk, and, as it turned out, he was not a satisfactory candidate for the operation.

Case 22.—S. C., a man, 53, was operated on May 2, 1951. An infarct was present on the posterior aspect of the left ventricle. It appeared to be extensive. He had a bundle-branch block. No attempt was made to place the graft because the sinus lay to the right of the aorta. The anatomical relationship appeared to be such that a patent graft might not be obtained. The surface of the heart and the lining of the parietal pericardium were gently abraded, and 0.2 gm. of powdered asbestos was applied to these surfaces. It is too early to evaluate the result.

Case 23.—M. C., a woman, 53, was operated on May 2, 1951. A graft was placed between the coronary sinus and the aorta. The second stage was done May 30, 1951. The graft was not patent. The epicardium and lining of the parietal pericardium were abraded, and 0.2 gm. of powdered asbestos applied.

Case 24.—W. S., a man, 53, was operated on May 30, 1951. A graft of vein was placed between the coronary sinus and the aorta. The second stage is yet to be done.

Case 25.—A. D., a man, was operated on Jan. 30, 1951.[12] A graft of vein was placed between the coronary sinus and the aorta. The second stage was done March 1, 1951. The graft contained a recent thrombus. The graft was opened, and the thrombus was removed. The incision in the graft was closed by sutures. Blood flowed through the graft from the aorta. The coronary sinus was partially occluded to a diameter of 3 mm. This patient is reported to have shown marked clinical improvement.

Case 26.—A male dentist, 41, was operated on March 1, 1951. An extensive old infarct was found on the posterior surface of the left ventricle. Most of the visible heart muscle showed diffuse fibrosis. Both major branches of the left coronary artery were palpable and probably calcified. There was an initial fall in blood pressure. The graft was placed between the coronary sinus and the aorta. The second stage of the operation was done March 22, 1951. The coronary sinus was partially occluded to a diameter of 2.5 mm. The veins in the myocardium became pink. This patient gave a favorable report on the result. His activity has increased, and his color has improved. He has no "icy sweats." He is thinking about returning to his practice. This patient had a severely damaged heart.

Case 27.—This woman, 51, was operated on March 22, 1951. There was an initial fall in blood pressure. An infarct was found in the posterior aspect of the left ventricle about 3 cm. in diameter. The heart was enlarged and had a sluggish beat. A graft of jugular vein was placed between the coronary sinus and the aorta. The veins became pink when the sinus was occluded. The postoperative course was complicated by recurrence of angina decubitus, probably an occlusion of another small coronary artery, an episode of 2: 1 auriculoventricular block, and gallop rhythm. The second operation was done May 31. A murmur was readily heard, and it was believed that the graft was patent. However, the graft was occluded by thrombosis. Nothing further was done to the heart because of the risk.

---

[11] [illegible]rations in Cases 17 through 24 were done at St. Michael's [illegible]wark, N. J.; Drs. N. A. Antonius, John McGuire and [illegible] aided us in this study.

[12] [illegible] in Cases 25 through 28 were done at Hahnemann [illegible]a. Drs. George Geckeler and Charles Bailey aided

Case 28.—H. R., a man, 48, was operated on May 31, 1951. A large infarct was present on the posterior aspect of the left ventricle. The pericardium was adherent to this infarcted area. A graft of vein was placed between the coronary sinus and the aorta. When the coronary sinus was temporarily occluded, the veins in the heart became pink. Venous oozing from ventricles also became pink. The operation was well tolerated.

COMMENT

In this series of 28 patients there were 23 recoveries and 5 deaths, a mortality rate of 18%. Four of the five patients who died had advanced degenerative disease. These patients were completely or almost completely incapacitated. The fifth patient who died had unexplained necrosis of the graft, a complication which we had not observed. This patient had little or no coronary artery disease; extensive adhesions between the heart and pericardium were present. It is possible that a latent infection was activated. Of the 23 patients who recovered, 13 had both stages of the operation, and 2 had only the first stage. Of the remaining eight patients, the graft was thrombosed in six and not placed in two. In several of these eight patients the alternate operation was done. This consisted of abrasion of the heart and pericardium with application of a chemical irritant to produce intercoronary communications.[30]

The period of time is not sufficient to enable us to make clinical evaluation of these patients. So far the results appear to be or actually are favorable. A number of patients are nothing less than enthusiastic about the result. They get satisfaction in describing their improvement and urge other patients to have the operation done. The importance of scientific measurement of the results is recognized and will be carried out. In making clinical appraisal one can err in either direction, and this is to be avoided. Both time and additional experience are necessary to determine the benefit of this operation on patients.

CONCLUSIONS

In conclusion, several comments can be made. The development of this operation required years of experimental work. The benefit of the operation has been tested and measured on dogs. The benefit is, indeed, significant. The application to patients has been made with considerable mortality among bad-risk patients but with a more acceptable mortality among patients who are not completely incapacitated. The operation on patients has not been completely developed. The problem of thrombosis exists in some cases. No doubt this problem can be overcome. Another problem is to determine the results in patients and to find out whether the benefit to the dog can be transferred to the patient with coronary artery disease. In order to do this, the operation will have to be done on additional patients.

2065 Adelbert Rd. (Dr. Beck).

AGE AND SURVIVAL IN CASES OF ACUTE MYOCARDIAL INFARCTION

Henry I. Russek, M.D., Staten Island, N. Y., Burton L. Zohman, M.D., Brooklyn,
Alexander A. Doerner, M.D., Staten Island, N. Y., Allen S. Russek, M.D., New York
and
LaVere G. White, M.D., Staten Island, N. Y.

For the elderly patient with acute myocardial infarction a poor prognosis is frequently made by his attending physician, even when an uneventful recovery appears to be in progress. It is not clear whether this attitude is based on sound clinical and statistical experience or originates from the defeatism that has long been associated with treatment of the aged. It is true that crude statistics have shown that the mortality rate from acute myocardial infarction increases among those of advancing years. Woods and Barnes [1] observed the death rate to be twice as great among those beyond 60 as among those below; Rathe,[2] in his analysis of a series of cases, concluded that a poor prognosis is indicated when the patient is over 55. Hellmuth,[3] Levine and Brown [4] and others also confirmed the observation that the prognosis of an acute attack of myocardial infarction becomes progressively more serious as the patient increases in age.

Such statistical differences, however, could be due simply to a higher incidence of severe attacks in later life, rather than to a specific influence of age on survival in the individual case. At the time of writing no evidence could be found in the literature to justify the common belief that a patient over 60 has a greater chance of dying from acute myocardial infarction than a younger patient who has sustained an attack of similar severity. Thus, unwarranted conclusions may have been drawn from random comparison of mortality rates, without correction for differences in severity of attacks, clinical signs, or incidence of previous myocardial damage. Obviously, similar cases in different age groups must be compared if a true concept is to be formulated regarding the elderly patient's relative capacity for survival. The

data derived from such comparison would establish whether or not the statistical correlation of age with group prognosis reflects a similar age influence on survival in the individual case.

From the concept recently introduced by Dock,[5] it would appear that involutionary changes in the myocardium might be responsible for the higher mortality rate in elderly subjects with acute cardiac infarction. According to this view, senile deterioration of the myocardium occurs independently of coronary atherosclerosis and is an important factor in the precipitation of heart failure in patients over 50. A higher incidence of congestive failure accompanying acute myocardial infarction in older subjects, however, affords no proof that this complication is less ominous when it occurs under similar circumstances in younger patients. Since bedside evaluation of prognosis is largely dependent on the presence or absence of serious signs and symptoms, the clinician should know whether or not the significance of these criteria is altered by the element of age.

In an attempt to answer this question, age and mortality were studied in a group of 1,047 cases of acute myocardial infarction in which consideration was given, in each instance, to the severity of the attack, the occurrence of previous cardiac infarction, and the presence of specific clinical signs. From the findings observed during the first 24 hours of hospitalization, our cases were classified as "good risk" or "poor risk," and the effect of age on subsequent mortality was evaluated in each of the two categories. The following criteria were enumerated in order to identify patients who had sustained a severe attack or who for other reasons warranted a poor prognosis: (1) previous myocardial infarction, (2) intractable pain, (3) severe degree or persistence of shock, (4) significant enlargement of the heart, (5) gallop rhythm, (6) congestive heart failure, (7) auricular fibrillation or flutter, ventricular tachycardia or intraventricular block, and (8) diabetic acidosis or other serious complicating diseases. Patients who showed none of these symptoms on the first day of hospitalization were classified as "good risks" to distinguish them from the "poor risk" patients who manifested one or more of these unfavorable prognostic signs.

TABLE 1.—*Analysis of 1,047 Cases of Acute Myocardial Infarction According to Age and Severity of Attack*

	Total	"Good Risk"	"Poor Risk"
All ages	1,047	489 (46.7%)	558 (53.3%)
Under 60	618	331 (53.6%)	287 (46.4%)
60 or over	429	158 (36.8%)	271 (63.2%)

	Total	"Good Risk"	"Poor Risk"
All ages (%)	33.4	3.1	60.0
Under 60 (%)	28.8	3.0	58.5
60 or over (%)	40.1	3.2	61.6

COMPOSITION OF SAMPLE

The material was derived from three independent sources, the United States Public Health Service Hospital in Staten Island and the Maimonides and Kings County Hospitals in Brooklyn. An analysis was made of 1,047 patients consecutively admitted for acute myocardial infarction, of which 201 were treated at the United States Public Health Service Hospital, 223 at Maimonides Hospital, and 623 at the Kings County Hospital (State University, College Division). In every instance the clinical diagnosis of acute myocardial infarction was confirmed by one or more electrocardiograms. The age range for the entire series was 30 to 88 years, with a mean age of 56.7 years. The average age for the 618 patients under 60 was 51.5 years as compared with 67.4 years for the 429 patients 60 or older. The difference between the mean ages of these two groups was therefore 15.9 years. In the entire series there were 843 men and 204 women. The average age for the men was 56.0 years while that for the women was 60.0 years. When the male and female groups were analyzed separately, the average age for those under 60 and those 60 and over was found to be almost identical for the two groups. The crude death rate during the period of hospitalization was computed for the entire series and then for patients in each of the two component age groups. Comparison was then made between the mortality rates among the "good risk" cases and the "poor risk" cases in these two age groups. A similar breakdown of data was undertaken for the male and female groups. All of the patients in this study were treated by conservative means without the use of anticoagulants.

RESULTS

The mortality rate in 618 subjects under 60 was 28.8%; whereas, the mortality rate in 429 subjects 60 or older was 40.1% (Tables 1 and 2). These findings, therefore, confirm previous observations which recorded a statistical correlation of age with group prognosis. On the other hand, the mortality rate among 331 "good risk" patients under 60 was 3.0% while that among 158 similar patients 60 or older was almost identical—3.2%. An analysis of mortality among "poor risk" patients also failed to reveal that age is a significant factor in the outcome of the individual case. Thus, among 287 patients under 60 who showed unfavorable criteria for recovery on the first day of admission, the mortality rate was 58.5% as compared with 61.6% among 271 older patients who also showed poor prognostic signs. This small difference in death rate is not believed to be significant in view of the greater incidence of critical cases in the older "poor risk" group. Separate analysis of the data according to sex showed that among both men and women age plays no part in determining the outcome o the individual case once the attack has developed.

COMMENT

The analysis presented confirms previous observations which have indicated that the mortality rate from acute myocardial infarction is elevated among persons past middle age. It appears to show, however, that this increase in mortality is mainly the result of a higher incidence of serious attacks among those in the later decades of life. Thus, in our series 46.4% of the patients under 60 presented serious prognostic signs at the beginning of their clinical attack as compared with 63.2% of those 60 or older (Table 1). It appears unlikely that this difference results from greater impairment of coronary circulation in old age. The incidence of previous attacks of myocardial infarction was actually slightly less in our older age group. Moreover, the frequent observation that the aorta and coronary arteries are remarkably free from significant atherosclerotic change in elderly patients suggests that absence of severe atherosclerosis of the coronary vessels may be a prerequisite to the attainment of old age. It has been postulated that senile deterioration of the myocardium is an important factor in the precipitation of heart failure in patients over 50.[5] Such involutionary changes in the heart would best explain the greater vulnerability of the older patient as a result of acute myocardial infarction. This concept offers the most logical explanation for the greater frequency of serious attacks and the higher mortality observed statistically in old-age groups. Regardless of the explanation, however, our findings appear to show that once the attack has struck the immediate outcome can only be estimated from the clinical signs and symptoms in the individual case. Our grouping of patients according to the severity of the clinical picture during the first 24 hours of hospitalization has not demonstrated that the factor of age exerts a bearing on immediate survival. Although severe attacks are commoner in older subjects, the prognosis of a severe or mild attack appears to be unaltered by age. It must, therefore, be concluded that the statistical correlation of age with group survival is not accompanied by a similar age influence on survival in the individual case.

In a previous publication[6] we pointed out that no justification exists for the routine employment of bishydroxycoumarin (dicumarol®) in cases of acute myocardial infarction and that this form of therapy should be reserved for "poor risk" cases exclusively. It is our contention that only in the severer attacks does the benefit from bishydroxycoumarin therapy outweigh its harmful effects. Others[7] have noted that use of anticoagulants significantly reduces the mortality rate from acute myocardial infarction in old age groups, a result not observed among younger patients. The explanation for this finding obviously rests on the higher incidence of serious attacks among older subjects. However, since we have shown that age itself is not a significant factor in the immediate outcome of acute myocardial infarction in the individual case, age should not be considered an important element indicating or contraindicating the use of anticoagulants. It is therefore concluded that the history and the clinical signs and symptoms in any given case—and not the age of the patient—provide the data necessary for prognostication and for decision with regard to the use of anticoagulant drugs.

SUMMARY AND CONCLUSIONS

Crude statistics have shown that the death rate from acute myocardial infarction is considerably higher among patients over 60 than among those below this age. From these findings it has been generally accepted that the patient over 60 has a greater chance of dying from acute myocardial infarction than the younger patient who has sustained an attack of equal severity. The possible fallacy in such reasoning suggested a study in which the elderly patient's relative capacity for survival could be estimated from a comparison of clinical attacks of similar nature and severity.

An analysis of mortality in 1,047 cases of acute myocardial infarction is reported. From the data obtained the following conclusions have been drawn:

1. The higher mortality rate from acute myocardial infarction observed in older age groups is due to a greater frequency of serious attacks, probably as a result of senile deterioration of the myocardium.

2. Nevertheless, the outlook for a severe or mild attack is no worse in the elderly patient than in the younger one. The prognosis in an individual case clearly does not depend on age but on clinical signs and symptoms.

3. The statistical correlation of age with group prognosis, therefore, should not prejudice the clinician in his prediction of the probable outcome in any specific case.

4. Similarly, the age of the patient should not be considered an important factor indicating or contraindicating the use of anticoagulants in acute myocardial infarction.

5. The pessimism commonly revealed in the estimation of prognosis in any elderly patient with this disease is unwarranted if based on age alone. Too often the persistence of such pessimism, even after satisfactory recovery, has condemned the elderly "good risk" survivor to a nonproductive, boring existence. Patients in this category as well as those in younger groups may be successfully rehabilitated toward regaining a measure of personal, social, and economic independence consistent with their residual capacity.

Artefacts on Chest X-Ray Films.—A type of opaque, white artefact which occurs on the chest roentgenogram is often mistaken for a pulmonary infiltration. Although it may at times resemble an area of primary atypical pneumonia, or a fresh unorganized pulmonary infarct, this artefact is most likely to be confused with the early minimal lesion of pulmonary tuberculosis. . . . The so-called "pressure mark" . . . is dependent upon a local change in the sensitivity of the film emulsion with consequent alteration in its response to roentgen-ray exposure. These changes . . . are brought about by mechanical stretching, bending or compression. The opaque, white "pressure mark" results from the latter influences only when applied to the film before its roentgenographic exposure. . . .

Although "pressure marks" may be strongly suspected when the shadow in question shows a higher degree of whiteness than any other portion of the chest roentgenogram, and when this whiteness diminishes imperceptibly towards its periphery, an acute exudative tuberculous lesion of a confluent lobular nature has at times been noted to present a very similar appearance. . . . The observer's index of suspicion should be heightened . . . when any of the following conditions are noted: (1) the presence of associated artefacts more readily identified; . . . (2) the presence of a generalized increase in film sensitivity as evidenced by a roentgenogram which appears darker than it should after normal exposure and development, or appears of uneven density. The shadow which appears crescent-shaped will be easily recognized as a typical "pressure mark," especially if accompanied by a sharp black "crinkle" line, or by a linear white mark bisecting its concavity. The observer's suspicions are confirmed when immediate roentgenographic re-examination fails to disclose the shadow previously noted.—Irving J. Kane, M.D., Artefacts Simulating Minimal Pulmonary Tuberculosis, *The American Journal of Roentgenology and Radium Therapy*, November, 1951.

ORAL CORTISONE THERAPY IN INTRACTABLE BRONCHIAL ASTHMA

Emanuel Schwartz, M.D., Brooklyn

Specific treatment of bronchial asthma, such as avoidance of offending allergenic agents and specific hyposensitization, so far are the best methods to pursue in order to obtain complete relief of symptoms. However, when a patient is observed during an acute asthmatic attack, satisfactory symptomatic relief is desired as quickly as possible. The type of treatment instituted will depend on the severity, frequency, and duration of the asthmatic attack. In acute asthma, and even in chronic asthma, the acute exacerbations can be relieved without difficulty with epinephrine or aminophylline, and in mild attacks with oral or aerosol bronchodilators. The administration of cortisone is not the first line of approach in the treatment of acute asthma.

In a small number of patients the asthmatic paroxysm increases in severity, the usual therapeutic measures fail, the patient becomes epinephrine-fast and remains in a severe, constant asthmatic state, designated as status asthmaticus. In these patients the usual therapeutic measures, such as the use of fluids, oxygen, intravenous aminophylline, and 5% dextrose, antibiotics, iodides, and barbiturates, should be employed first.

In patients with status asthmaticus who have failed to respond to the usual therapeutic measures, Randolph and Rollins,[1] Carryer and associates,[2] Segal and Herschfus,[3] Rose,[4] and others [5] have reported striking benefit resulting from the use of corticotropin (ACTH) or intramuscularly administered cortisone. They produced marked symptomatic relief in most cases. It should be emphasized that once corticotropin or cortisone therapy is instituted, the usual therapeutic measures should not be discontinued immediately. Repeated injections of epinephrine or aminophylline may still produce some immediate but temporary relief until corticotropin or cortisone takes effect. These hormones do not work rapidly nough to relieve the asthmatic symptoms immediately or ave the patient's life in an acute allergic emergency. From the experience of several investigators, the symptoms are relieved within 24 to 96 hours after corticotropin or cortisone therapy is started. With the onset of symptomatic relief the usual therapeutic measures can be gradually eliminated. Relief with cortisone or corticotropin is temporary, and symptoms tend to recur. During the period of remission, an attempt should be made to determine and avoid the etiological factor or factors and specific hyposensitization should be instituted.

Sometimes, the acute asthmatic attacks are so frequent, the patient has no interval free from symptoms. Even between the acute attacks, the patient has some dyspnea and wheezing. These symptoms may persist for days, months, or even years. The patients in this group are designated as having chronic intractable bronchial asthma.

TABLE 1.—*Clinical Course of Patients Prior to Oral Cortisone Therapy*

22. H. D.	42	F	6	Very severe; 24 hr. duration

SCOPE OF STUDY

A study has been undertaken to determine whether orally administered cortisone will influence the symptoms of chronic intractable bronchial asthma (Table 1). A total of 22 patients receiving 31 courses were treated with orally administered cortisone tablets. The ages of the patients ranged from 5 to 67 years. There were 12 females and 10 males. The duration of asthma varied from four months to 35 years. Prior to the onset of oral cortisone therapy, these patients had moderately severe, or very severe, incapacitating asthmatic attacks ranging in duration from four days to six years, and were resistant to all other forms of therapy. Oxygen inhalation and repeated injections of intramuscular epinephrine and intravenous aminophylline were required several times

during the day and at night in most cases, and produced slight and temporary relief. Hyposensitization in 15 of the 22 patients had not afforded significant relief.

An attempt was made to minimize the occurrence of possible side effects. All patients were given a low-sodium diet and 15 drops of saturated solution of potassium iodide three times daily. The group consisted of clinic and office patients. They were observed daily and contacted as often as it was necessary. The patients' weight, fluid intake and output, blood pressure, and the results of the urine examination for sugar were charted daily. In the beginning, extensive laboratory tests were made. However, later on it was found that short-term therapy could be carried out safely for up to two weeks without extensive tests if there were proper cooperation between patient and physician and careful observation as to the possible occurrence of side effects. With long-term therapy, extensive laboratory tests were again made once or twice weekly. Patients with hypertension, diabetes mellitus, congestive heart failure, coronary artery disease, peptic ulcer, and psychopathic personalities were not included in this study.

TABLE 2.—*Results of Oral Cortisone Therapy*

Patient	Duration of Treatment: Course	Duration of Treatment: Days	Results	Length of Remission	Remarks
1. F. N.	1	12	Excellent	2 weeks	Returned to school on 4th day of cortisone therapy; best winter in 5 yr.
	2	2	Excellent	10 days	
	3	2	Excellent	10 days	
2. C. W.	1	14	Excellent	10 days	Status asthmaticus developed during 4th course; hospitalization; usual therapeutic measures failed; intramuscular ACTH therapy produced relief
	2	7	Excellent	3 days	
	3	1½	Excellent	14 days	
	4	2	None	....	
3. C. M.	1	45	Good	2 days	On 2d day of cortisone therapy, resumed household duties—1st time in six months
4. I. I.	1	24	Good	2 days	On 4th day of therapy did entire family wash; on 7th day danced all evening; on 22d day angioneurotic edema of face and generalized urticaria developed (1st time in 3 yr.)
5. B. K.	1	35	None	None	Decrease in dyspnea and cough; examination of chest always wheezing, though symptomatically improved
6. B. P.	1	4	Excellent	210+ days	Marked improvement 2 hr. after 1st dose of 12.5 mg. cortisone
7. H. A.	1	17	Excellent	1 day	On 2d day of therapy did heavy work putting up storm windows and gardening
	2	14	Excellent	7 days	
8. A. M.	1	18	Fair	3 days	On 4th day of therapy was able to work 1st time in 10 mo.
	2	5	None	....	
9. E. M.	1	29	Excellent	180+ days	Best relief in 32 yr.
10. S. G.	1	4	Excellent	92 days	Relief in 24 hr.; 4 days treatment
11. R. R.	1	7	Good	42 days	Symptomatic relief; examination of chest wheezing at all times
12. A. B.	1	7	Excellent	1 day	Relief after 2d tablet of cortisone
13. R. S.	1	7	Excellent	64 days	Transitory pulmonary infiltration with blood eosinophilia of 18 mo. duration arrested with intramuscular cortisone; remission of pulmonary infiltrations 16 (+) mo.
14. M. A.	1	5	Good	18 days	Even with complete relief of symptoms, examination of chest showed slight wheezing
	2	2	Good	9 days	
15. G. L.	1	4	Excellent	150+ days	Mediastinal and subcutaneous emphysema during asthmatic attack Nov., 1944
16. G. Y.	1	2	Excellent	12 days	Relief in 12 hr.; previously no relief with epinephrine, aminophylline, oxygen, penicillin
17. E. Z.	1	12	Good	11 days	Allergic rhinitis also improved, while taking cortisone
18. H. T.	1	2	None	....	Patient died after 2 days of cortisone therapy; total dosage 400 mg.; autopsy findings: complete fibrosis, myocardium left ventricle, severe generalized arteriosclerosis, emphysema, bronchiectasis, hypertrophy right heart; adrenals, normal size and shape, no depletion of lipids
19. A. C.	1	6	Excellent	6 mo.	Complete relief in 24 hr.; remission 6 mo. in duration
20. A. L.	1	1	None	....	Cortisone therapy discontinued because of edema of hands and feet
21. H. C.	1	25	Fair	12 hrs.	Return of pretreatment pattern of asthmatic attacks after 2 courses of cortisone therapy
	2	12	Excellent	9 days	
22. H. D.	1	7	Excellent	14 days	13 previous hospital admissions because of status asthmaticus; oral cortisone might have prevented another; remission after cortisone, 14 days; then sudden severe status asthmaticus requiring hospitalization developed; relief in 36 hr. with ACTH and usual therapeutic measures

DOSAGE SCHEDULE

The initial daily dose of cortisone ranged from 200 mg. to 300 mg. for adults. The daily dose for the second day ranged from 100 mg. to 200 mg. and was followed by 100 mg. daily until adequate relief was obtained. When relief occurred, the dose was reduced to the minimum amount necessary to maintain adequate relief. The total daily dose was given orally in four equal doses at four-hour intervals. The dose for children was 25% to 75% of the adult dose. In adults the average maintenance dose was 25 mg. twice daily, although an attempt was made to adjust the dose to the clinical response of the patient. The duration of therapy ranged from 1 to 45 days.

RESULTS OF TREATMENT

Orally administered cortisone definitely relieved the symptoms of chronic intractable asthma in 26 of 31 courses given to 22 patients. Five courses in five different patients had no benefit, and four of these five patients had emphysema. In those patients who obtained relief it was much greater than that previously obtained with any other medicament. Eighteen patients obtained relief in 5 to 12 hours, six in 24 hours, one in 48 hours, and one in 72 hours. Relief was maintained as long as adequate therapy was continued. Discontinuation of cortisone therapy, or too great a reduction in the daily dose, resulted in a partial or complete recurrence of the pretreatment pattern of the asthmatic attacks. The symptoms of 18 patients (61%) relapsed within two weeks after cortisone therapy was stopped; in 8 patients they relapsed within the first week and in 10 during the second week. The shortest period of remission was 12 hours; the longest, 210 days. There was no relationship between the total dosage, or duration of adequate therapy, or both, and the length of the remissions in these patients (Table 2).

Five patients had more than one course of therapy:

1. F. N. had three courses with excellent results, with remissions of 14 days, 10 days, and 10 days. Thereafter her symptoms were easily controlled with oral or aerosol bronchodilators.

2. C. W. had excellent results with the first three courses and none with the fourth.

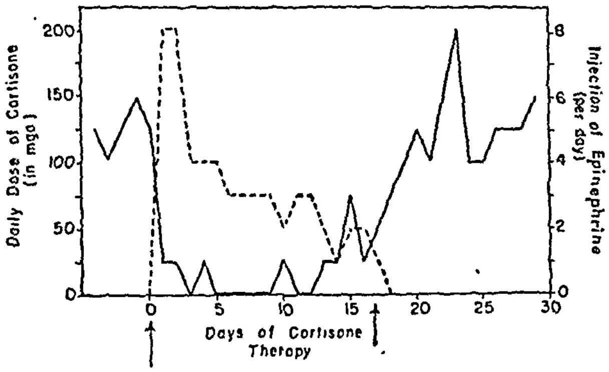
3. H. A. had marked relief with two courses but his remissions lasted only one and seven days.

4. M. A. was given two courses with good results each time and remissions of 18 and 19 days.

5. H. C. after 25 days of therapy had fair relief with a remission of 12 hours, and with the second course of 12 days' treatment had excellent results with a remission of nine days.

The following paragraphs describe in greater detail certain aspects of several cases in which oral cortisone therapy was used. The case numbers refer to those in Tables 1 and 2.

Case 7.—H. A. had received 17 days of cortisone therapy during the first course of treatment, with excellent relief. Prior to the onset of cortisone therapy he had been using between four and six injections of epinephrine daily (Chart), and the total for a similar pretreatment period of 17 days was 87 injections. During the first 12 days of treatment he required only one injection on each of the 1st, 2nd, 4th, and 10th days. On the others he used none. From the 13th to the 17th and final day of treatment, when the dosage was either 25 mg. or 50 mg., he used a total of eight injections. After discontinuing cortisone he had a remission of one day, and thereafter he needed between three and eight injections a day, a total of 85 injections, for a similar 17-day period. He had excellent results with a second course of 14 days' therapy with a remission of 7 days' duration. From then on, with the simultaneous administration of 50 mg. of cortisone every third day and oral bronchodilators for 26 days, he was able to decrease his epinephrine injections to one, and occasionally two, injections a day. Previously, oral bronchodilators did not afford relief.



Relationship between epinephrine requirements and cortisone therapy.

Case 18.—H. T., a 67-year-old man, died from an acute asthmatic attack after two days of cortisone therapy. The total dosage was 400 mg. The patient experienced marked relief in 36 hours, and then the clinical picture changed rapidly and the patient died suddenly during an acute asthmatic attack. The autopsy findings (made by Dr. Joseph Bellamy) were as follows:

Severe generalized arteriosclerosis. Severe coronary arteriosclerosis with calcification and marked narrowing of all branches. The myocardium of the left ventricle showed large areas of complete fibrosis, particularly in the septum. The heart was not enlarged, and there was slight left ventricular hypertrophy. The lungs showed emphysema, bronchiectasis, and fibrosis, particularly of the apical regions. The right side of the heart showed moderate hypertrophy. The liver and spleen showed changes of congestive heart failure. The kidneys showed severe arteriosclerotic scarring. The adrenal glands were normal in size and shape. The adrenal cortex was yellow and there was no depletion of lipids. Incidental findings not related to the cause of death were nodular goiter and benign prostatic hypertrophy. It was the opinion of the pathologist that the main cause of death was the severe damage to the heart, which, with the added burden of the lung disease, was unable to cope with the strain.

Case 13.—R. S., a 17-year-old female student, was treated successfully in February, 1950, with intramuscularly administered cortisone because of transitory pulmonary infiltrations with blood eosinophilia of 18 months' duration. She had an unusual, stormy, and protracted clinical course, and her response to cortisone was remarkable and dramatic. It produced a disappearance of fever, tachycardia, leukocytosis, pulmonary infiltrations, anemia, purpura, arthralgia, polyneuritis, and subcutaneous nodules. Cortisone had no effect on a preexisting right bundle branch block and cardiac hypertrophy. Cortisone interrupted the downhill course of the disease. To date her response to effort is normal and the length of remission of the pulmonary infiltrations is 16 months. However, she continued to have mild asthmatic attacks, and on one occasion a moderately severe intractable asthma of two weeks' duration developed which failed to respond to the usual therapeutic measures. She had excellent relief 12 hours after the onset of oral cortisone therapy. The duration of treatment was seven days, followed by a remission of 64 days.

There seemed to be an increase in the sense of well-being with most of the patients, and in several a sense of euphoria developed. Several of the patients showed a marked increase in physical activity while taking cortisone. The increased physical activity was mainly due to symptomatic relief. In some, however, the sense of well-being, or euphoria, was present even though examination of the chest at the time revealed wheezes and sibilant and sonorous rales. As a rule the appetite was increased. In one patient ankle edema developed after she had received cortisone for 24 hours; this cleared up when the medication was stopped. There was an initial decrease in urinary output in four patients, and an initial gain in weight in six. There was no change in the blood pressure in any of the patients. Occasionally an instance of glycosuria appeared. With the decrease of the dose these side effects disappeared. No incidence of hemorrhagic tendency, appearance of ulcer, or masked infection such as pneumonia or septicemia has been encountered in this series of patients. There were no other side effects, and there were no significant changes in serum sodium, potassium, or blood chloride levels.

SUMMARY AND CONCLUSION

Orally administered cortisone relieved the symptoms of intractable bronchial asthma in 26 of 31 courses of treatment given to 22 patients. Five courses in five different patients had no beneficial effects, and four of the five patients had emphysema. Relief was much greater than that obtained previously with any other medication. Relief with orally administered cortisone occurred within 5 to 72 hours after the onset of therapy, and on adequate dosage was maintained during cortisone administration. The symptoms of 18 patients (61%) relapsed within two weeks after cortisone was discontinued. In this series of patients there was no relationship between the total dosage or duration of therapy, or both, and the length of remissions. Ankle edema occurring in one patient, an initial decrease in urinary output in four, an initial gain in weight in six, and an occasional occurrence of glycosuria disappeared on decreased dosage of cortisone. One patient died from an acute asthmatic attack, and the autopsy findings showed no evidence of relationship between cortisone therapy and the cause of death. Once an optimum dose of cortisone has produced complete relief, the simultaneous administration of suboptimal doses of cortisone and such types of drugs as bronchodilators, iodides, antibiotics, and other well-tried general measures of treatment suggest the possibility that a remission can be maintained much longer. A low sodium intake should be continued after the course is terminated in order to stimulate the patient's own adrenal cortex and reduce the early relapses. The results justify the use of orally administered cortisone for symptomatic relief in intractable bronchial asthma after the usual therapeutic measures have failed. Cortisone therapy is not a substitute for allergic management. Only by the elimination of the offending factor, or factors, and hyposensitization where elimination cannot be carried out, can one obtain complete success.

TERRAMYCIN IN EPIDEMIC TYPHUS, AMEBIC DYSENTERY, AND TYPHOID

John H. Killough, M.D.
and
Gordon B. Magill, M.D., Cairo, Egypt

Terramycin, introduced one year ago, has been tried and found successful in the treatment of an extensive array of human diseases. Its usefulness in epidemic typhus, acute amebic dysentery, and typhoid, however, has not yet been established. This report presents the results of treatment in five patients with epidemic typhus, seven patients with acute amebic dysentery, and five patients with typhoid. The findings suggest that in epidemic typhus terramycin is curative and that in acute amebic dysentery it is efficacious but has definite limitations. In typhoid, contrary to reports of failure to date, terramycin may elicit a favorable response in some patients.

Snyder and his colleagues [1] in experiments with chick embryos found that terramycin suppressed the multiplication of Rickettsia prowazeki, but in studies on infected cotton rats the same authors were unable to obtain survival. Reports of trials in epidemic typhus in humans have not yet come to our attention, but clinical studies have demonstrated the effectiveness of terramycin in other rickettsial diseases. Schoenbach and his co-workers [2] and Bauer and his co-workers [3] have reported the use of terramycin in four cases of Rocky Mountain spotted fever. All the patients responded rapidly, becoming afebrile in 36 to 72 hours. Similar favorable action of terramycin in other rickettsial diseases has been observed by Rose [4] in four cases of rickettsialpox, by Smadel and collaborators [5] in four cases of tsutsugamushi disease, and by Bauer and his colleagues [3] in one case of murine typhus.

Most and Van Assendelft [6] reported on a 10-day treatment with terramycin in 22 patients with amebiasis. One patient, whose stools had become negative for amebae, again had positive stool cultures on the 11th day after the termination of therapy; the stools of the other 21 patients remained negative. However, the duration of follow-up was short. Eight of 11 patients had been followed less than three weeks, and the exact interval of study on the others is not clear. The average number of stools examined per patient subsequent to therapy was 3.3. No cases of acute amebic dysentery were reported in the series.

Reported experience with terramycin in typhoid is meager. Bauer and his co-workers [3] described one patient who did not respond to a five-day course of treatment which began on the 20th day of illness. Reference is made in the same paper to unpublished studies by Knight [7] which "indicated that terramycin has little effect in clinical typhoid fever." Attempts by Bauer [8] to eradicate the infection in two biliary tract carriers also failed. Treatment with terramycin of other Salmonella infections has been more encouraging. Satisfactory response has been noted in four cases of gastroenteritis, three due to Salmonella newington and one to Salmonella oranienburg.[8]

EPIDEMIC TYPHUS

The five patients in this series came to our attention near the end of the first week of illness, when the cutaneous rash appeared; thus the duration of illness at the beginning of treatment ranged from six to eight days. The severity of the illness on admission varied considerably even in this small series. One patient, although his temperature was high and the rash moderately heavy, ap-

peared to be only slightly ill. Three patients were severely ill, and the fifth patient was considered to be fatally ill.

Four tests were utilized to establish the diagnosis of typhus: (1) Weil-Felix (OX19) agglutination with rising titer; (2) complement fixation; (3) rickettsial agglutination; and (4) isolation of rickettsiae from the patient's blood by guinea pig and mouse inoculation. Four of the cases fulfill three of the criteria for a diagnosis of typhus; one case fulfilled two of the criteria. Rickettsial agglutinations in the latter case were positive for murine typhus in higher dilutions than for epidemic typhus, but clinically this case could not be differentiated from one of epidemic typhus.

The dosage of terramycin was 75 mg. per kilogram of body weight per day. The drug was administered on a four-hour schedule with a preliminary loading dose of 25 mg. per kilogram of body weight. Terramycin blood levels were checked in all patients and varied from 2.6 to 11.1 γ per milliliter. Therapy was continued until the patient had been afebrile for 48 hours.

In this series the response was uniformly rapid. The stupor present on admission in the first four patients cleared within 24 hours. The fifth patient was maniacal on admission and unable to articulate clearly. He continued in an acute psychotic state for nine days, i. e., until two days after cessation of therapy, at which time his mental state began to show improvement; his subsequent convalescence was uneventful.

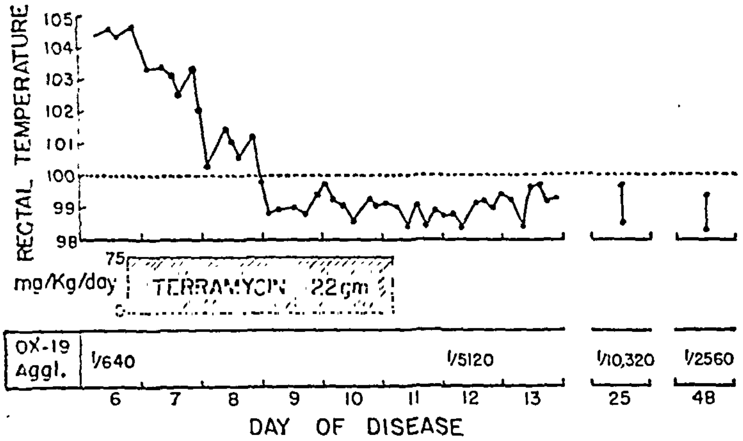

Fig. 1.—Temperature response of patient with typhus to terramycin within 56 hours. Uncomplicated convalescence.

Rectal temperatures on admission ranged from 103 to 106 F, but, as did the other signs and symptoms, the fever rapidly subsided on treatment. The temperatures of four of the patients became normal within three days, but the most severely ill patient required five days to attain a normal temperature. There were no complications during convalescence. A typical clinical course as observed in four of the five cases is illustrated by the following case report.

REPORT OF CASE

An Egyptian man, aged 34, was well until six days prior to admission, when he had a shaking chill and a severe frontal headache and fever developed. On the second day of his illness he went to bed because of pain in his thighs, calves, and knee joints. On the third day he had ringing in his ears and a cough productive of small quantities of clear sputum. He was seen by a physician, who advised hospitalization. On admission (Fig. 1) the temperature was 104.4 F and the patient was mentally confused. Examination showed a macular rash on the trunk, most marked on the back but also involving the arms and legs. There was no rash on the palms or soles. Most of the lesions blanched on pressure, but some were fixed. Two hemorrhagic areas were present in the conjunctiva of the left eye. Both lungs were resonant to percussion, but there were scattered rhonchi and crepitant and musical rales to auscultation. The liver was just palpable at the right costal margin, and the spleen was palpable 3 cm. below the left costal margin; neither was tender.

The total white blood cell count was 7,500, with 73% neutrophils. Blood drawn on admission agglutinated Proteus OX19 in the dilution of 1:640. A portion of this specimen inoculated into guinea pigs subsequently led to the isolation of a Rickettsia.

Terramycin was begun on the seventh day of illness. Within 24 hours the patient was alert and his headache had decreased in intensity, although the temperature remained elevated. No new rash was identified. At the end of 52 hours of treatment, the patient had become afebrile and the only complaint was of slight dizziness. Terramycin was discontinued after 48 hours without fever, the patient having received a total of 22 gm. He was allowed to become ambulatory on the fifth day of hospitalization; subsequent convalescence was uneventful.

AMEBIC DYSENTERY

To date seven patients with amebic dysentery have been treated with terramycin. Three of the patients had experienced prior attacks of bloody diarrhea, and two of these three had been treated with aureomycin for amebiasis three months previously.

On admission to the hospital all of the patients complained of generalized abdominal cramps and bloody diarrhea with mucus. In addition six complained of pain in the right upper abdominal quadrant. All seven exhibited tenderness over the hepatic area, and in six the liver was enlarged to below the costal margin. All had tenderness over both the ileocecal and the rectosigmoid areas.

Repeated stool examinations revealed numerous motile trophozoites of Endamoeba histolytica. Stool cultures were positive for E. histolytica and negative for bacterial pathogens in every case. Proctoscopic examinations revealed various degrees of mucosal ulceration, inflammation, and edema. Specimens taken from these ulcerations again showed numerous active trophozoites of E. histolytica, many with ingested red blood cells.

The loading dose of terramycin consisted of 50 mg. per kilogram of body weight given in the first hour. The dose administered for the first three days was 150 mg. per kilogram per day, after which it was reduced to 75 mg. per kilogram per day for the balance of the total treatment period of 14 days. Three of the seven patients complained of anorexia and nausea while on the *initial* higher dose. These side-effects promptly disappeared after the planned reduction in dosage.

In general the response to treatment was good. Stools and proctoscopic specimens became negative for amebae in four patients within two days, while the other three, more severely ill, required four to eight days to produce negative stools and specimens. Abdominal cramps and bloody diarrhea disappeared within two to six days, and the time required for disappearance of these symptoms was generally proportional to the degree of the lesions observed at proctoscopy. Pain in the right upper abdominal quadrant and hepatic tenderness required a longer period to disappear, and in one patient hepatic abscess developed during terramycin therapy.

Two of the seven patients have only recently completed treatment and cannot be discussed in terms of follow-up. Of the five patients with a follow-up of three months or more, only two have remained asymptomatic and clinically free of E. histolytica after one course of terramycin. *These two patients have had 57 and 18 stools* examined and found negative during follow-up periods of 19 and 14 weeks, respectively. In the other two patients, E. histolytica recurred in the stools. In one of these the parasite was observed again only eight days after the cessation of therapy while the patient was still in the hospital. Symptoms of dysentery recurred in this patient; he was retreated with terramycin with a satisfactory response. In the other patient, E. histolytica reappeared in the stool within a month after he had been discharged. The former case seems almost surely a relapse; the latter may possibly represent a reinfection. The fifth patient, although his stools had become negative for amebae and his dysentery had responded well, is the one in whom a hepatic abscess developed during terramycin therapy. The report of this case follows.

REPORT OF CASE

An Egyptian man, aged 35, was well until 16 days before admission, when generalized abdominal cramps developed, associated with bloody diarrhea seven to ten times daily, low grade fever, and marked anorexia. His symptoms gradually increased in severity, and he passed as many as 21 bloody liquid stools per day. Other than three tablets of an iodochlorhydroxyquin preparation (entero-vioform®) daily for two or three days just prior to admission, the patient had received no specific medication. He denied previous similar episodes of diarrhea.

Physical examination on admission revealed an acutely ill, emaciated man with obvious abdominal discomfort and with marked tenderness in the right upper and lower quadrants of the abdomen. Rectal temperature was 100 F. Abdominal splinting prevented palpation of the liver edge, but percussion indicated that this organ was enlarged to about 4 cm. below the costal margin. The stools consisted largely of blood and mucus and contained many trophozoites of E. histolytica, some with ingested red blood cells. Proctoscopy revealed numerous ulcer craters up to 1.5 cm. in diameter and marked mucosal edema. Protoscopic specimens taken from the ulcers contained many E. histolytica trophozoites and were negative for enteric pathogens by bacterial cultures. The white blood cell count was 17,600, with 91% neutrophils. Liver function studies revealed a sulfobromophthalein retention of 9% at 45 minutes, serum bilirubin of 1 mg. per 100 cc., and normal thymol and zinc turbidities.

The patient was given the experimental routine dosage of terramycin on his fifth hospital day (Fig. 2). His condition began to improve within 36 hours after the institution of therapy. Stools gradually became less frequent and no longer contained gross blood. Hepatic and abdominal pain and tenderness decreased in severity, and the patient's appetite improved. However, on the fourth day of treatment the patient began to complain of increasing pain in the hepatic area; on the sixth day of terramycin therapy his temperature rose to 103 F. Although stools were normal in color, semi-formed, and negative for amebae by the ninth day, the patient continued to be febrile and complained of increasing pain. On the 11th day a mass was visible in the right upper quadrant of the abdomen. Three days later, after 14 days of treatment, terramycin was discontinued, the total dose having been 66 gm. At this time the liver edge was palpable 18 cm. below the right costal margin in the midclavicular line. The hepatic mass, first noted on the 11th day, now measured 10 cm. in diameter and was markedly tender and fluctuant. After the completion of terramycin therapy, the patient was given chloroquine, 1 gm. daily for two days and then 0.5 gm. daily for 12 additional days. Response was dramatic, with defervescence of fever in 36 hours. The patient appeared less toxic, his appetite returned, and liver pain and tenderness decreased in severity. On the 10th day of chloroquine therapy, 245 cc. of tenacious pea-green exudate was aspirated from the mass, with further diminution of pain and tenderness in the right upper abdominal quadrant. Examinations and cultures of the exudate for both E. histolytica and bacteria were negative. After the completion of chloroquine therapy, the patient continued to improve. He was observed on the ward for another eight weeks, during which time he gained 42 lb. (19 kg.) in weight. The liver edge gradually receded to a point 3 cm. below the costal margin. During this period of observation, 35 stools, of which five were purged specimens, were examined in saline smears, by stained smears, and by culture. All were negative for E. histolytica. Proctoscopy one week before discharge revealed one small superficial ulcer in the rectum; otherwise the findings were negative. At last examination, six weeks following discharge, the patient had remained asymptomatic and three additional stool examinations had been negative for *E. histolytica.*

TYPHOID

Five patients with typhoid have been treated with terramycin. All were acutely ill and febrile. The duration of illness before treatment ranged from 6 to 11 days, with an average of 9 days. In all five cases Salmonella typhosa was isolated from the blood, and in three the organism was also isolated from the feces. Admission Widal tests resulted in titers varying from 1:10 for O antigen and negative for H antigen, to 1:1,280 for O and 1:1,280 for H.

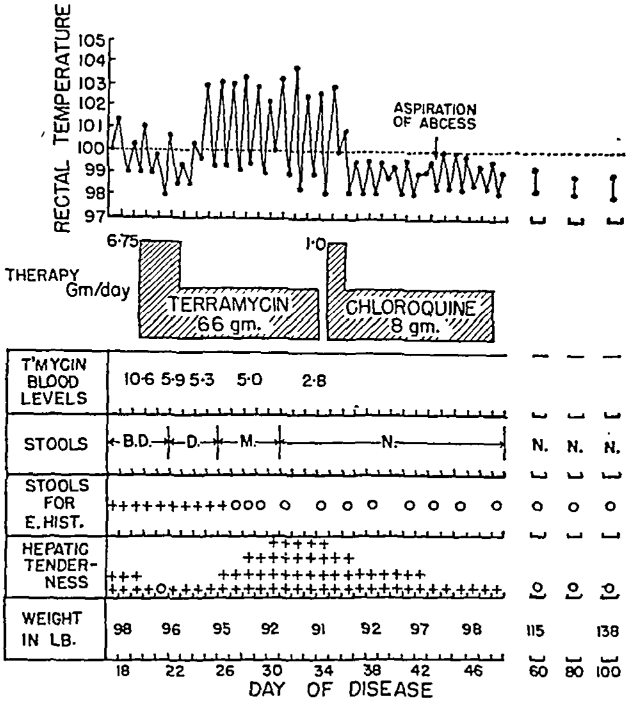

Fig. 2.—Initial response of 35-year-old-man to terramycin followed by increasing symptoms and signs of a hepatic abscess during course of amebic dysentery. Subsequent chloroquine therapy and aspiration resulted in resolution of the abscess. B.D., D., M., and N. refer to bloody diarrheic, diarrheic, mushy, and normal stools, respectively.

The first three patients were started on terramycin at 75 mg. per kilogram of body weight per day. In one of these the dose was later increased to 125 mg. per kilogram per day. The dose in the remaining two patients was 100 mg. per kilogram per day.

Clinical response following the institution of terramycin therapy was variable. Only three of the five patients appeared to respond to the drug, becoming afebrile in an average of four and one-half days after the institution of therapy. These three patients received an average total dosage of 43 gm. over an average period of 11½ days. Another patient did not become afebrile until after 15½ days of terramycin therapy (26th day of illness).

In this patient the prolonged period of fever following the institution of therapy probably represented a course of the disease uninfluenced by therapy. The remaining patient was initially treated with 75 mg. per kilogram of body weight per day. Because the organism isolated from his blood required 3.12 γ of terramycin for inhibition of growth for 48 hours and the blood levels attained with the initial dosage were from 3.7 to 5.2 γ, the dosage was increased to 125 mg. per kilogram per day. After this increase in dosage, the blood levels ranged from 5.7 to 7.7 γ. However, this patient continued to be febrile and had an intestinal hemorrhage on the third day. After remaining highly febrile for 22 days on terramycin therapy (98 gm. of the drug), the patient was given chloramphenicol, with satisfactory response within 36 hours.

All four of the patients treated with terramycin alone were followed for three to five weeks after the completion of therapy. In none of these were positive urine or stool cultures observed during this period, nor were there clinical findings suggestive of relapse. The patient that failed to respond to terramycin and therefore received chloramphenicol was found to be excreting S. typhosa in his feces two months after the completion of therapy.

SUMMARY

Experience with terramycin in five cases of epidemic typhus, seven cases of acute amebic dysentery, and five cases of typhoid is reported.

In typhus the response to treatment with an average of 22 gm. of terramycin administered over an average of five days was excellent. Subjective and objective improvement was observed within 24 hours of the beginning of treatment in all patients. Four patients became afebrile within three days, and by the fourth day these patients were in uneventful convalescence. The fifth patient, moribund on admission, became afebrile by the sixth day; convalescence thereafter was uneventful save for some mental confusion which persisted until the 10th day. The results, as observed in the five cases, appear to compare favorably with reports in which chloramphenicol or aureomycin has been used.

In amebic dysentery an average of 66 gm. of terramycin was administered over a 14-day period. In all patients there was disappearance of bloody diarrhea, tenesmus, and other dysenteric symptoms within two to six days (average four days). Stools and proctoscopic specimens became negative for amebae after two days in four patients and after four to eight days in the remaining patients.

Unlike the dysenteric symptoms, hepatitis, concomitant in all patients, disappeared slowly. In one patient a hepatic abscess developed during terramycin therapy. The administration of chloroquine resulted in recession and final cure of the abscess. The result in this case and the relatively poor response of hepatitis to terramycin alone in the other cases suggest that the combined use of chloroquine and terramycin may prove more efficacious to combat both the hepatic and the dysenteric phases of the disease.

Five of the patients treated for dysentery have been followed for three to five months, with 20 or more stool examinations in each case. In two there has been a reappearance of the parasite, and in one of these two dysenteric symptoms have recurred.

The dosage of terramycin in the five cases of typhoid ranged from 43 gm. in 12 days to 98 gm. in 22 days. Three of the patients became afebrile in an average period of four and one-half days, but there was no evidence of response in the other two. There were no relapses in this series.

CONCLUSIONS

The therapeutic results in this small series suggest that terramycin is curative in epidemic typhus, will prove useful with limitations in acute amebic dysentery, and, contrary to previous reports, may be effective in some cases of typhoid.

LABORATORY-ACQUIRED INFECTIONS

S. Edward Sulkin, Ph.D.
and
Robert M. Pike, Ph.D., Dallas, Texas

Although numerous individual case reports of laboratory-acquired infections have appeared in the literature, few studies have given any indication of the magnitude of this problem as it relates to the occupational health of laboratory workers. As a matter of fact, until recently little consideration at all has been given to the need for adequate protection of personnel who come in daily contact with disease-producing agents. By means of a questionnaire circularized to 98 laboratories in the United States, Meyer and Eddie [1] assembled pertinent information regarding laboratory infections due to Brucella. From published reports and personal communications we collected data regarding the occurrence of viral infections contracted in laboratories in the United States and elsewhere in the hope that such information would indicate where the greatest need for caution exists in work with viruses.[2] In all, 222 cases with 21 deaths were summarized. In a more recent extensive survey we recorded a total of 1,342 infections caused by a variety of disease-producing agents, and presumably acquired as a result of laboratory work in the United States during the last two decades.[3] A condensed summary of these findings is presented in Table 1. In each group of infectious agents there is at least one which outnumbers the others as the

Read in the Symposium on Occupational Health of Medical Personnel before the Section on Preventive and Industrial Medicine and Public Health at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

cause of laboratory infections. Brucellosis, hepatitis, Q fever, amebiasis, and coccidioidomycosis headed the list in their respective categories. Of the 1,342 infections disclosed by means of the survey, 39 were fatal. The highest proportion of fatalities occurred among the viral diseases, in which 4.5% resulted in death.

INFECTIOUS AGENTS

Brucellosis, tuberculosis, tularemia, typhoid fever, and streptococcal infections accounted for 72% of the bacterial infections and 31% of infections due to all types of agents. With the exception of Pasteurella tularensis these are agents which are extensively handled in many laboratories. Considering the relatively small number of laboratory workers who come in contact with P. tularensis, the 65 cases of laboratory-acquired tularemia would indicate a high theoretical attack rate. The large number of infections due to members of the Brucella group of micro-organisms would support the general contention that these organisms are eminently dangerous to the bacteriologist.

A large proportion of the 95 cases of hepatitis have occurred in recent years. That this disease exists as an occupational hazard for physicians, nurses, technicians, and other persons handling human blood or blood products has been emphasized by several investigators [4] who suggest that these infections should be regarded as compensable under industrial insurance. Hinton [4d] calls attention to acute infectious hepatitis as a hazard for workers in blood-testing laboratories. Several institutional outbreaks account for a large proportion of the cases of Q fever.[5] None of the 18 cases of amebiasis, which outnumber the other parasitic infections presumably acquired in the laboratory, could definitely be established as having originated in the laboratory. It is of interest that the single case of accidental infection caused by Leishmania donovani is believed to be the only reported case of leishmaniasis originating in the United States and the only reported case of an accidental infection in a laboratory worker due to this parasite.[6] Cases of laboratory-acquired coccidioidal infection are reviewed by Smith,[7] who emphasized the hazard of acquiring this and other mycotic infections in the laboratory, and suggests that the environment of a laboratory in which Coccidioides is handled is comparable to that of a coccidioidal endemic area.

Table 1.—*Distribution of Cases of Laboratory Infection According to Type of Personnel and Work Performed*

DISTRIBUTION OF INFECTION AMONG LABORATORY AND OTHER WORKERS

It can be seen that by far the largest proportion of infections occurred among professional and technical workers, research assistants, and graduate students. Only 63 instances of infection were reported among undergraduate students or medical or veterinary students, and 132 occurred among nontechnical personnel including animal caretakers, janitors, and dishwashers. Hinton [4d] reports that 50% of those engaged for more than one year in washing glassware or other articles containing blood were infected with the agent of acute infectious hepatitis. Three cases of Q fever occurred in laundry workers handling laundry contaminated in the laboratory.[8]

At least 86 infections occurred among persons indirectly associated with work involving infectious agents, such as clerical and maintenance workers and occasional visitors. The first known human infection with the agent of Q fever in the United States occurred in a scientist who was visiting a laboratory engaged in work with the agent.[9] Another infection with this agent was acquired in a similar manner.[10] Smith [7] also refers to the occurrence of coccidioidal infections acquired by visitors to his laboratory.

It is evident from the results summarized in Table 1 that the greatest number of infections occurred in persons engaged in diagnostic work. This does not imply that this type of work involves the greatest risk, since it is obvious that more persons are engaged in diagnostic work than in other types of laboratory activity. At least 308 infections occurred among those known to have been associated with research activities. The small number of infections reported among persons concerned with the production of biologics probably represents only a small proportion of those which have occurred. Of the 29 infections resulting from classwork, 13 were typhoid fever. In many instances an infection occurred in a person involved in a combination of activities including the production of biologics and research or diagnostic work.

TABLE 3.—*Estimated Incidence of Laboratory-Acquired Infections in Various Types of Laboratories and Among Various Types of Personnel*

	Estimated Average No. of Persons at Risk Annually	No. of Infections Recorded in 20 Yr.	Attack Rate Per Yr. Per 1,000
Type of Laboratory			
Research institutes	2,948	267	4.1
Public health laboratories	12,157	169	0.7
Hospital laboratories	36,212	428	0.6
Biologic manufacturers	5,022	54	0.5
Agricultural and veterinary schools and experimental stations	10,145	91	0.5
Colleges and medical schools	45,641	281	0.3
Clinical laboratories	8,788	41	0.2
Total	120,913	1,334	0.5
Type of Personnel			
Trained scientific personnel	50,393	1,005	1.0
Animal caretakers, janitors, dishwashers	15,134	132	0.4
Students (not engaged in research)	51,005	63	0.1
Others	4,381	86	1.0
Total	120,913	1,286*	0.5

* In 48 cases the occupation was not indicated.

In Table 2 the probable sources of the laboratory-acquired infections are summarized. In a large proportion of instances the source was not known, yet there is indication that the person had worked with the agent concerned. At least 173 infections seemed to result from aerogenic transmission of the agent, though in many instances this could not be definitely established. Contact with infected animals and ectoparasites accounted for more infections than did the handling of discarded glassware and other apparatus. The 98 infections which resulted from postmortem examinations of human beings included known accidents. Many of the known accidents, however, involved self-inoculation or spattering of infectious material while using a needle and syringe. The second largest group of accidents resulted from the spilling and spattering of viable organisms through careless handling of culture flasks and other equipment. At least two psittacosis infections resulted from handling broken vials of lyophilized virus. Seven infections are attributable to the use of the Waring Blendor; two of typhus and one of rickettsialpox occurred in the absence of known accidents, while three infections with psittacosis virus and one with typhus Rickettsia were due to known accidents with this apparatus. Of the 33 known accidents resulting from the aspiration of infectious material through pipettes, 11 resulted in typhoid. Most of the 32 accidents resulting from the bites of animals or ectoparasites occurred among the rickettsial diseases. Accidents which result from the handling of broken glass, and other apparatus occurred largely among dishwashers.

In order to obtain a reasonably accurate impression of the risk of infection involved in laboratory work it is necessary to consider the number of instances of laboratory-acquired infection in proportion to the total number of workers at risk who escape infection. Questionnaires used in the survey were designed to obtain information regarding total numbers of laboratory personnel both in laboratories where no infection had occurred as well as in those reporting cases. Of the 4,472 questionnaires sent out, 2,143 were returned. In 1,662 of these the total average annual number of all kinds of laboratory workers in contact with infectious materials reported was 33,587. In an attempt to use this figure as a basis for arriving at a reasonable estimate of the total population at risk, it was necessary to make certain assumptions. If one assumes that 75% of all laboratories in the United States received questionnaires and that the number of persons reported by the 1,662 laboratories represents a proportionate sample of the total number of persons involved, then the average annual number of persons at risk for the past 20 years would be 120,913. By making similar assumptions it was possible to arrive at an estimate of the number of persons working in various types of laboratories and in different kinds of activity.

When the number of cases of infection recorded was considered in relation to the estimated number of persons at risk, the attack rates indicated in Table 3 were obtained. These rates are at best rough estimates, but they probably approximate the relative risks in the various situations indicated. As might be expected, the highest attack rate was found in institutions devoted almost exclusively to investigative work in which an individual may be exposed to the danger of infection with a given agent daily for prolonged periods. In teaching institutions the low rate among students who come in contact with infectious agents only in classwork is offset by the higher rate among persons working in research laboratories in the same institutions. The rate for clinical laboratories not associated with hospitals is low, probably because many of these are small laboratories where an individual may spend a large portion of his time working with materials that are noninfectious.

The attack rates in Table 3 were calculated on the basis of the presumed laboratory-acquired infections that have come to our attention. Additional infections of which we have no knowledge have certainly occurred. This fact would tend to make the calculated rates lower than they should be. It is also obvious that the rate will vary according to the type of agent being handled. It is interesting to note that the theoretical attack rate suggested by Wenner and Paul [11] for poliomyelitis presumably acquired in the laboratory is comparable to the attack rate indicated in Table 3 for research institutes.

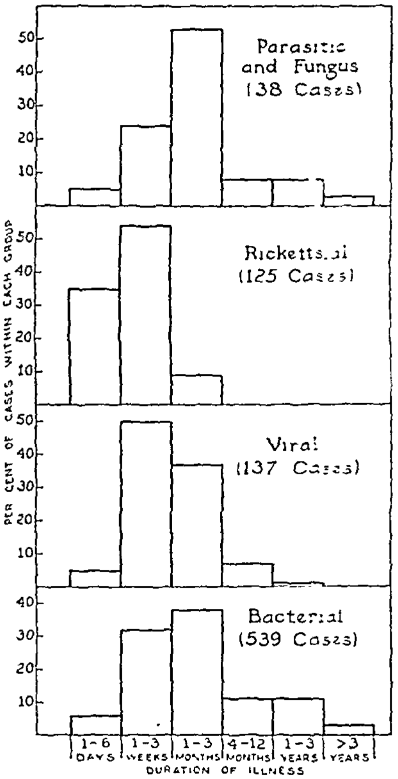
The duration of illness is a matter of considerable importance not only to the laboratory worker but also to employers. Such information was provided either in the questionnaires returned or in published records in 839 instances of nonfatal infection. The distribution of these infections with respect to duration of illness is shown in the figure. Among those infected with bacteria, 63% were ill for one month or longer. The distribution of parasitic and fungus infections is similar. The illness lasted as long as a month in 45% of the viral infections and in only 9% of the rickettsial infections. The longer duration of bacterial infections is in part owing to cases of brucellosis and tuberculosis. One contributing factor in the relatively short duration of rickettsial illnesses is the fact that a number of these infections occurred in immunized persons. It is apparent from this analysis that the time lost from work has been considerable. An average of 65 days was lost from employment by the 16 patients with homologous serum jaundice reported by Trumbull and Greiner.[4b] The economic loss involved for the patient with coccidioidomycosis is emphasized by Looney and Stein.[12] One patient was confined to a hospital for a period of 17 months.

CONDITIONS UNDER WHICH INFECTION MAY OCCUR

The results of the survey indicate that infection may occur under conditions that have, until recently, been considered innocuous. Investigations conducted at Camp Detrick, Md., and elsewhere indicate that aerosolization of infective agents may create unrecognized hazards.[13] By using sieve-type air samplers placed around the laboratory working area, investigators at Camp Detrick were able to determine that bacterial aerosols were released during such common laboratory procedures as the removal of stoppers from dilution bottles, removal of wet plugs from broth culture tubes, and the removal of infectious material from a vaccine bottle by means of a hypodermic syringe. It has also been shown that bacterial aerosols are produced during the process of pipetting, pouring, and vigorous agitation of dilution blanks. The production of aerosols by these and other laboratory procedures has been demonstrated by means of high-speed photography in studies conducted by Johansson and Ferris.[13a] The expulsion of a stream of liquid from a syringe while inoculating the exposed chorio-allantoic membrane of the developing chick embryo, or the intranasal inoculation of experimental animals, may cause the formation of aerosols which may bring about human infection by way of the respiratory tract. Numerous infections have no doubt occurred through the aerosolization of contaminated bedding in animal cages. Stein and Rogers [13d] demonstrated that viable spores may escape into the atmosphere when suspensions of Bacillus anthracis or Bacillus cereus are heated in open containers. More recently these investigators [13e] showed that viable bacteria or viruses may be present in the vapor removed by high vacuum desiccation from frozen suspensions of biologic materials, a procedure now widely used in many laboratories.

It is apparent from these data that aerosolization of infective material resulting in the aerogenic transmission of disease-producing agents must actually account for a larger proportion of the infections than is indicated by the survey. Recognized accidents, for example, seem to account for only a small proportion (16%) of infections, and many (274) infections which occurred in persons who were known only to have worked with a given agent were undoubtedly aerogenic.

Even though many pathogens are known to decrease in their virulence for the natural host after a number of animal passages, one must maintain continuous vigilance against laboratory infections. A number of incidents serve to emphasize the fact that many disease-producing agents retain their virulence for man even after many animal passages. There is evidence, for example, that the Nichols strain of Treponema pallidum has retained its virulence for man after repeated rabbit transfers over a period of many years.[14] Similar evidence is available for a number of viral agents which have been through numerous animal passages.[15] On the other hand, each of the three cases of poliomyelitis acquired in the laboratory occurred in persons exposed to virus recently isolated from human cases.[15a] No infections occurred at a time when the majority of work on experimental poliomyelitis was carried out with strains that were well established in the monkey.[11] Repeated passage of many viral agents in chick embryo tissues may result in decreased virulence for the natural host.[16]



Percentage distribution of cases according to duration of illness.

Exposure to pathogens or even accidents with infectious materials do not necessarily result in laboratory infections. Tager and his associates,[17] for example, have escaped even inapparent infection while doing investigative work with Coccidioides immitis. In at least one instance no overt infection followed introduction of sputum containing tubercle bacilli into the mouth, but the tuberculin test subsequently became positive.[18] A similar situation resulted following the ingestion of living Brucella organisms; no overt infection resulted but the development of a positive skin test indicated inapparent infection. In a few instances laboratory workers showed no evidence of illness following the aspiration of viable typhoid bacilli. However, although the accidental ingestion of viable typhoid bacilli will usually result in an overt though modified infection even in the immunized individual, there is evidence that prompt prophylactic use of sulfadiazine followed by chloramphenicol may prevent the development of clinical signs of infection.[19]

In a number of instances a disease-producing agent was first recognized as a cause of disease in man as a result of a laboratory infection. Actually the first known human infection in the United States with the agent of Q fever occurred in a laboratory in which the agent had been isolated from ticks.[9] Even the most recent addition to the Rickettsia group, Rickettsia akari, and to the viral group, the Coxsackie virus, have been responsible for laboratory infections.[20] The discovery of a new neurotropic virus resulted from the death of a research worker who was bitten on the hand by an apparently healthy monkey while engaged in experimental work on poliomyelitis. This agent, which has been designated B virus,[21] has since been responsible for at least two fatal cases of ascending myelitis in laboratory workers handling monkeys.[22] The B virus is carried by monkeys in much the same manner that the virus of herpes simplex, to which it is related antigenically, is carried by human beings.[23] Laboratory infections with the virus of louping ill were the only known human cases until two naturally acquired cases occurred in 1948.[24] Similarly, the first definite human infection with the causative agents of Aujeszky's disease (pseudorabies),[25] Newcastle disease of fowl,[26] D virus,[27] Vibrio fetus,[28] and more recently vesicular stomatitis [29] occurred as laboratory infections. A single human infection probably resulted from the bite of infected black flies (Simulidae) used in Leukocytozoon transmission experiments in ducklings.[30] The first human infection with the Mengo encephalomyelitis virus occurred in the laboratory where this agent was originally isolated from rhesus monkeys, the mongoose, and from mosquitoes.[31] Although Serratia marcescens is ordinarily considered to be nonpathogenic,[32] at least four infections occurred in laboratory workers incidental to exposure to aerosols produced with this organism.[33]

RECOMMENDED SAFETY MEASURES

The numerous cases of proved laboratory-acquired infections should impress on clinicians and hospital administrators the importance of giving consideration to the health and welfare of laboratory workers who are engaged in the handling of infectious material. Safety measures are being recommended [34] and numerous devices are being invented to protect laboratory personnel and to minimize infections which result from the production of infectious aerosols. An important item is the provision of adequate animal inoculating boxes or transfer cabinets properly equipped with ventilating devices for the control of aerosols. A number of workers have developed safety equipment of this type.[35] To minimize the risk to laboratory workers who inoculate animals by the intranasal route, van den Ende [35a] designed an inoculation box which prevents the distribution of infective droplets into the air during this type of operative procedure. The device, which serves for studying the extent of pollution of the air frequently accompanying intranasal inoculations, consists of a constant draft produced by a gas burner with incineration of the contaminated air. Using this cabinet as a basis, Shepard and his associates [35b] described a protective cabinet for the infectious-disease laboratory designed especially to house electrical equipment such as Waring Blendors and mechanical mortars which may be a source of danger. A protective cabinet for use by investigators studying Coccidioides immitis and other infectious fungi was designed by Keeney.[35c] Although the highly infective nature of the chlamydospores of C. immitis is recognized, and several infections are known to have occurred in persons who were not working directly with the fungus,[36] no known infections have occurred in the laboratory where this cabinet had been in use for at least two years, and skin reactivity to coccidioidin developed in none of the personnel. Smith,[7] however, had little success with a cabinet of similar design.

Recognizing the hazard involved in experimental work with plague bacilli, Meyer and his associates [37] constructed an inoculation chamber to protect the experimenter from risk of exposure following intranasal animal inoculation. Animals remain in the chamber which is treated with a propylene glycol aerosol before they are removed to a special isolation room. Smith [7] is using a protective chamber similar to that described by Meyer and his workers [37] when handling cultures of Coccidioides immitis on solid media especially when susceptibles are present in the same building. To limit the hazard of working with this agent, Looney and Stein [12] seal culture plates suspected of containing this fungus and examine them after autoclaving the plate. Several others recommended moistening the culture on solid media before making transfers.[38] One of these investigators [38b] wets the fungus with tween® 80 in saline before making transfers to solid media. Another [38c] moistens the organism which is cultured on slants by plunging through the cotton plug a sterile needle attached to a syringe containing saline, thus reducing the chance of liberating a cloud of spores when the plug is removed.

Aspiration of infectious fluids through a pipette is one of the well-recognized, obviously dangerous mishaps. Several devices have been developed to reduce the dangers of getting such infectious fluids into the mouth. A common practice is to plug the proximal end of the pipette with absorbent cotton. A pipetting device designed by Wedum [39] obviates the need for direct oral suction on the pipettes and is better than the commercially available pipettes designed for this.

The 80 cases of viral hepatitis resulting from diagnostic work originated mostly from specimens of blood submitted for serological or chemical examination. It has been suggested that most of these infections can be prevented through the use of rubber gloves [4a, d] and that all specimens of blood, urine, and feces from a patient with viral hepatitis should be labelled "infectious" and "handle cautiously." [40] To minimize infection with Coxiella burnetti among laboratory personnel, Meikeljohn and Lennette [41] have eliminated such procedures as centrifuging and blending, and use separate buildings or cubicles for infected animals. In addition, they maintain triethylene glycol aerosols in workrooms and in animal houses. These procedures, in addition to immunization with a C. burnetti vaccine, have virtually eliminated the hazard of working with this agent.

Prophylactic immunization is available for many of the agents that have been responsible for laboratory infections. Immunization procedures, however, do not necessarily eliminate the risk of infection though there is evidence that infections which have occurred in immunized persons tend to be less serious.[42] In at least one instance no infection followed the accidental ingestion of approximately a billion virulent typhoid bacilli in a previously immunized person who received sulfadiazine and chloramphenicol shortly after the accident had occurred.[10] Kadull and his associates [42c] present convincing evidence of the efficacy of vaccine prophylaxis in tularemia among laboratory workers. Immunization with psittacosis virus vaccine has been suggested, but the effectiveness of this procedure has not been definitely demonstrated.[43] Immunization is recommended for those persons undertaking work with equine encephalomyelitis viruses[44] or with the agent of Q fever.[41] Also, BCG may afford some protection. Stokes and his associates [45] recommended prophylactic treatment with periodic injections of immune globulin in persons exposed to specimens from patients with viral hepatitis. The procedure is used in at least one laboratory processing blood.[45]

The prompt use of currently available chemotherapeutic agents should insure recovery and shorten the time of illness in the case of many infections.[46] Administration of sulfadiazine in pneumonic plague,[47] penicillin in anthrax,[48] and chloramphenicol in Q fever [10] are examples of successful therapy in laboratory infections.

SUMMARY

Although the problem of occupational hazards has been recognized in industry for many years, there has been until recently no recognition of these hazards as they apply to laboratory workers. Recent surveys by the authors have indicated that persons who work in research and diagnostic laboratories may be exposed to hazards of infection far beyond those met in ordinary living; the data in these surveys disclose numerous dangers frequently unrecognized in the laboratory.

Laboratory infections have been acquired from all categories of infectious agents—bacteria, viruses, rickettsiae, parasites, and fungi. They have been acquired by professional and technical workers, students, clerical and maintenance workers, and even by visitors to laboratories; and the resulting illness has varied in severity from inapparent infections to those with a fatal outcome.

Efforts are being made in numerous laboratories throughout the country to develop safety measures to reduce the incidence of these infections. Various types of ventilating devices, inoculating cabinets, and techniques for the handling of infectious material are in use in many institutions. In some laboratories available vaccination procedures are in routine use. Laboratory workers should be acquainted with the potential sources of infection and encouraged to make use of available safety measures wherever indicated.

RADIOISOTOPE HAZARDS AND PROTECTION IN A HOSPITAL

Marshall Brucer, M.D., Oak Ridge, Tenn.

In January, 1949, the Oak Ridge Institute of Nuclear Studies organized a Medical Division with a primary function of exploiting radioisotopes in the field of medicine. At that time many medical schools had experience in using radioiodine and radiophosphorus, but there was little experience available in the large-scale use of radioisotopes. In a few instances three or four different radioisotopes had been used, usually in small volume, but only in a very few places had many different isotopes been used in significantly large volume to produce hazardous operations. Thus, the problems involved in the use of a large number of radioisotopes simultaneously in a large number of patients were relatively unknown. Most of the anticipated problems were based on the exposures encountered in the production and research facilities of the Atomic Energy Commission and were of a totally different nature than those of a hospital-type operation: In general, they were experiences of protective problems, orders of magnitude beyond even the largest medical-type usage.

However, the problem is rapidly becoming more than that of a potential hazard. Since Aug. 2, 1946, when the Isotope Division of the Atomic Energy Commission began its isotope distribution program,[1] the distribution of isotopes for direct medical purposes has grown from a few shipments to well over 800 shipments monthly. This rapid growth of radioisotope usage explains the frequent revision of viewpoint on the design of processes and equipment. Ideas on how to handle radioisotopes are still in a state of flux, and sometimes the changes are disconcertingly radical. A current, pertinent example is the question of the best materials to be used for easily contaminated laboratory table tops. During 1950, stainless steel with a high polish was the accepted material. Such old-fashioned materials as alberene® soapstone were "out of the question." Nevertheless, a testing program during the past year seems to indicate that stainless steel is one of the most difficult of all materials to decontaminate while soapstone can be cleaned readily with a piece of emery paper. Under many conditions, a few inches of space are not critical, and with these few added inches soapstone absorbs radiation as effectively as does lead and acts as a shield in addition. It is very probable that within the next few years the relative usefulness of alberene® soapstone, lead, and stainless steel for various purposes may change considerably.

An equally radical change in opinion is developing around the design of hospital radioisotope wards. As long as only one patient receives a relatively small dose of radioiodine, no hazard is involved. However, when many

[1] AEC Contract Policy and Operations, United States Atomic Energy Commission, United States Government Printing Office, Jan., 1951, p. 30.

patients are being treated with different isotopes in relatively large quantities, a significant exposure hazard results. Under these conditions the question of shielding patients from the staff and from each other must be considered.

TABLE 1.—*Isotopes Used in the Medical Division, Oak Ridge Institute of Nuclear Studies, First Year of Operation, 1950-1951*

Radioisotope	Half-life	Shipments	*Quantity* (Millicuries)
Gallium ^{72}	14.3 hr.	158	10,920
Gold ^{198}	2.7 days	35	6,858
Iodine ^{131}	8 days	42	3,715
Cobalt ^{60}	5.3 yr.	5	2,220
Antimony ^{122}	2.8 days	15	267
Potassium ^{42}	12.4 hr.	1	125
Sulfur ^{35}	87 days	5	114
Phosphorus ^{32}	14.3 days	16	110
Hafnium ^{181}	46 days	4	100
Sodium ^{24}	14.8 hr.	10	90
Ruthenium ^{106}	1 yr.	4	50
Indium ^{114}	48 days	3	30
Manganese ^{54}	310 days	1	10
Cobalt $^{56-57}$	270 days	2	10
Carbon ^{14}	5,100 yr.	1	5
Nickel ^{63}	300 yr.	1	3
Zirconium ^{95}	65 days	1	1
Gallium ^{67}	78 hr.	1	1
Totals 18 Radioisotopes	....	305	24.629 curies

The medical program of the institute is chiefly concerned with the therapeutic value of radioisotopes in cancer therapy. This necessitates the use of relatively large doses of radioactivity. Concomitant studies relating to diagnostic and tracer use have brought about the use of a wide variety of radioisotopes. Thus, during the first full year of operation of the institute hospital, 18 different radioisotopes have been employed, totaling almost 25 curies of radioactivity (Table 1). The dosage in individual patients ranged from microcuries to almost a curie. This year's operation has provided a basis for discussion of the contamination and radiation protection problems to be encountered in a small hospital-type operation and designs for protective measures which appear to have practical usefulness.

POSSIBLE EXPOSURE WITHIN PATIENT AREAS

Of the total amount of radioactive substances brought into the hospital area, only a fraction create a potential hazard. During transportation, chemical preparation, and storage the activity is well shielded and the problems are mostly those of laboratory design and engineering. It is after the material is injected into a patient that the major problem arises.

It is too early to be dogmatic about whether or not a radioactivity exposure represents a hazard because there are too few data and too many opinions as to how much exposure should be allowed. But as a starting point in setting up regulations for personnel protection the recommendations of the Chalk River Conference on permissible doses were adopted.[2] The working assumption was that all personnel would spend the rest of their lives with some exposure to radioactivity. Therefore, for chronic exposure of the total body, the maximum permissib dose in the critical tissue (bone marrow) should be 0 rep per week. This is considered equivalent to 6.25 m liroentgens per hour, or 60 milliroentgens per worki day.

If personnel work only in levels of radiation lower th 6.25 milliroentgens per hour, there will be no questi of either moral or legal aspects of the hazards of radi tion exposure. Accordingly, the question that remains that of the practicability of carrying out normal hospi procedures under conditions giving doses no higher th this level and preferably giving the least possible exp sure.

When a patient has received a radioactive substan which emits gamma rays, it is possible to measure t exposure around the patient with reliable, standardiz instruments. When measuring a field of unknown radi tion it is proper to use an ionization chamber becau of its relative wave length independence. However, io ization chambers are less adaptable to untrained perso nel and the inaccuracies introduced with other metho are negligible in routine patient surveys. The instrume designed for use by the nurses of the institute's Medi Division (Fig. 1) is a portable Geiger-Mueller ty monitor powered by batteries mounted in a plastic co tainer. It weighs 6½ lb. (2.9 kg.). This survey met called the "Poppycock," has a light which flashes wi each count, a loud speaker which clicks, and a dial f reading exposures. By use of a spring switch the machi can be set for "prospecting" for low level exposure fiel or for surveying high level exposures. When "prospe ing," only the light and the speaker are operating, b when "surveying," the scale is in the circuit so as provide a means of estimating the level of radiatio

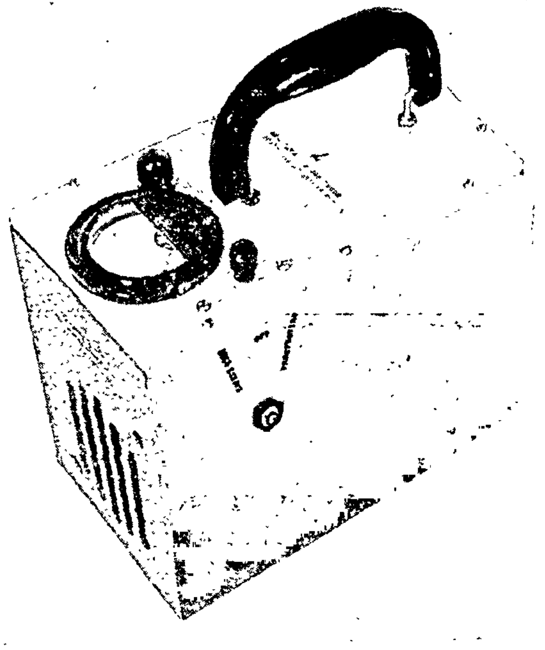

Fig. 1.—Nurses' radiation protection meter, "Poppycock," Oak Ridg Institute of Nuclear Studies.

Instead of calibrating the scale of the meter in milliroent gens, green, yellow, and red colors are painted on t give indication of tolerable, warning, and dangerou levels. When the pointer reads in the green area, th nurse has instructions that with most isotopes there ar *no* restrictions on work hours, visitors, and probably n restrictions on sample collections of urine, feces, blood, and linens. When the dial reads in the yellow area, there are no restrictions on work hours and visitors but there are probably some restrictions on sample collections from the patient. When the dial reaches the beginning of the red scale, the dosage is at 6.25 milliroentgens per hour. This point reads the only true calibration on the scale relative to radium. Beyond this point, there are time restrictions on working hours. Visitors must be restricted to short visits. All sample collections and waste materials must be monitored by a qualified person. In some cases the nurses themselves are qualified to use a standard survey meter to assess the extent of the restrictions.

(MAXIMUM PERMISSIBLE DOSE PER HOUR)
FOLLOWING INJECTION OF
20 mc GALLIUM 72 CITRATE

Fig. 2.—Maximum permissible isodose lines for 20 mc. gallium^{72}.

After a patient is given some radioactive substance, a line can be drawn around the patient at the points where the radiation in the air measures 6.25 milliroentgens per hour; this line is called the hourly maximum permissible isodose line (Fig. 2). Immediately after injection of 20 mc. of gallium 72 citrate, this isodose line is approximately a circle 4 meters from the center of the patient. Because gallium 72 has a very short half life (14.3 hours) and is excreted in the urine rapidly, this isodose line regresses toward the patient rapidly. In 2 hours the maximum permissible isodose line is 3 meters from the patient; in 16 hours the line is at 1 meter; after two days, it is close to the surface of the body so that there is little hazard to the nurses, aids, and orderlies carrying on ordinary hospital routines.

Most of the gamma emission of Ga^{72} is of high energy or "hard." About 25% of the gamma rays are over 2.5 mev; about 50% are over 2 mev. Ordinary hospital plaster walls provide almost no shielding; therefore, other persons must be kept away from adjacent hallways and ward rooms. Other patients getting radioactive therapy will probably receive only a negligible fraction of their own dosage from exposure to a gallium patient, but patients not under radioactive therapy must be shielded from active patients.

In another example, a patient received 200 millicuries of radiogold (Au^{198}) intrapleurally. Compared to gallium, Au^{198} emits a much softer gamma ray and fewer rays per disintegration. Hence, it is much easier to shield. Ordinary plaster walls have some shielding value but are not adequate with large doses. However, because its half life is longer (2.7 days), the maximum permissible isodose line regresses toward the patient much more slowly. In the example shown in Figure 3 the isodose line for 6.25 milliroentgens per hour was a meter from the patient a week after injection and did not approximate the body surface until two weeks had passed. During this time, according to definition, the area around the patient is an area of radiation hazard. Time spent close to the patient by any of the staff must either be reduced to a minimum and/or the patient shielded.

Shielding can be accomplished in many ways. Probably the simplest is to build the walls of certain rooms of dense concrete and use such rooms as private rooms. Under such conditions the problem is almost nonexistent in dosages used so far. A less expensive substitute for this ideal shielding is to erect a double layer of 4 in. (10 cm.) marble slabs up to the 6-ft. (182.8 cm.) level on critical walls. This was done in the Medical Division hospital in one critical area where a physician's office adjoins a private patient's bedroom. Another simple protective shield shown in Figure 4 is made of a 2 in. (5 cm.) slab of armor plate mounted on casters and upholstered. The large shield is 6 ft. long and 3 ft. (91.4 cm.) high; the small one is 3 ft. by 3 ft. When placed L-shaped around a patient's bed the radiation is reduced to negligible levels. Highly radioactive patients are placed along outside walls and are kept in bed during the period of greatest radioactivity. With an L-shaped shield added, the potential hazard is reduced to a minimum.

Fig. 3.—Maximum permissible isodose lines for 200 mc. gold^{198}.

The amount of radiation exposure to an attendant remaining close to the bed-side of high dosage patients is considerable. At approximately 1 meter from the patient during the entire course of intracavitary gold therapy, over 10 r of 400 kv. radiation was calculated. Hence, a nurse sitting next to the patient could be expected to absorb 1 r of total body exposure in three days. The nurse of a patient treated with 100 mc. of iodine would receive about 1 r of exposure in five days, and with 50 mc. of gallium the nurse could be exposed to 1 r in about two days.

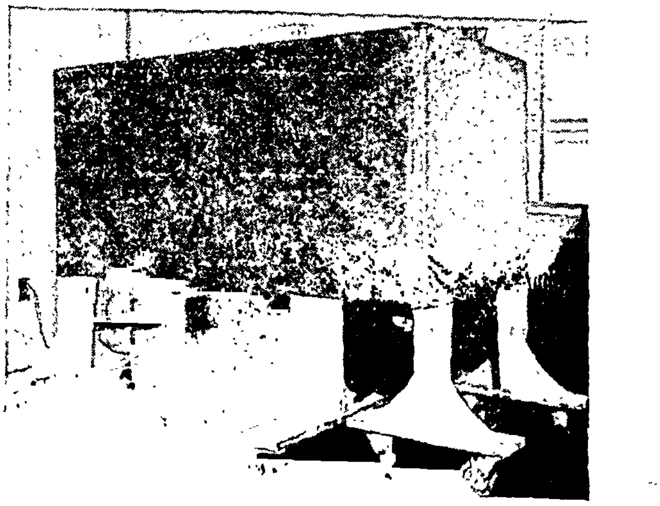

Fig. 4.—Movable bed shields for radioactive patients, Oak Ridge Institute of Nuclear Studies.

While such exposures may be of no immediate hazard if taken once and never repeated, they are intolerable as a working basis for personnel who make even a short-term career of handling radioactive patients.

ACTUAL PERSONNEL EXPOSURE

In the Medical Division of the Oak Ridge Institute of Nuclear Studies, every person wears some form of exposure measurement device. All personnel, including secretaries, visitors to patients, and janitors, wear the standard film badge. This is considered primarily a legal record of exposure and not a research tool. In addition, those persons exposed to considerable activity, such as nurses, processing technicians, and staff, wear pocket chambers which are read twice weekly by a health physicist, and a continuous record is kept. Selected personnel, those who are in close contact with large sources or who may be expected to have the greatest exposure, wear a direct reading pocket dosimeter. The latter are qualified to make their own decisions regarding exposure tolerances. In special circumstances such as surgical operations, autopsies, preparation of new compounds, and testing new equipment, palm and finger badges, wrist and forehead chambers, and other monitoring devices supplement these standard procedures.

A good example of the actual exposures received by various working classes of personnel is shown in Table 2. To construct the table a three-month period was considered, December, 1950, through February, 1951. During the period there was an average hospital load of 17 patients undergoing some type of radiation therapy. The isotopes brought into the hospital area, except for some long-lived materials already present, were 3.98 curies of Ga^{72}; 2.12 curies of Au^{198}; 1.11 curies of I^{131}; 0.04 curies of P^{32}; 0.02 curies of Na^{24}.

Only the routine film badge data are shown since all personnel wore the film badge. The films measure the total integrated dosage over a set period with readings for hard and soft gamma radiation; in this instance they are returned weekly. The open window reading is an index of the less penetrating radiation exposure and the shielded window is a better index of exposure to more penetrating radiation. By this method of measurement the maximum permissible dose is considered to be 60 milliroentgens per day for either reading.

The largest exposure was received by a staff chemist who processed the samples of Ga^{72} as they came from the reactor. The second largest exposure was to the chemistry technician helping him. The orderlies who spend most of their time caring for the needs of patients, and the technicians who handle the urine, feces, blood, and tissue samples received the largest routine exposures. However, in all cases, these exposures were considerably below maximum permissible levels. In comparison, the personnel of a busy routine diagnostic x-ray service in a nearby medical school received as much or more radiation than the institute personnel. This level is considered a normal condition in x-ray services and rarely occasions any comment.

A number of special measurements illustrate the hazard in nonroutine procedures. During a two and one-half hour operation to remove the left lung of a patient who had been given a 20 mc. test dose of Ga^{72} the surgeon and his first assistant each received a total of 400 milliroentgens to their hands according to film badges placed in the palms underneath their rubber gloves, whereas badges under their collars registered 30 milliroentgens. This difference is due in part to the rather energetic beta particles of Ga^{72} which have a maximum penetration of about 18 mm. of water. The anesthesist for this operation received total body exposure of 40 milliroentgens. In Table 3 four other operations are reviewed. When most of the isotope is confined to one location as in intra-abdominal therapy with Au^{198}, the hands of the surgeon

can receive a significant dose. The actual radiation per disintegration is not as great as with gallium, but the quantity of radioactivity is disproportionally greater. In the second and fifth examples in Table 3 the gold was confined to the lesser omental space; in the third example it was diffusely spread over the entire peritoneum. The surgeons here received somewhat more than the "allowable" hand dosage, which is generally taken to be about five times the total body dosage. However, because such operations are not done routinely, the actual risk is minimized. In contrast, a far greater risk is in a standard implantation of radium needles shown in example 4. In another series of measurements, the average exposure to the unprotected neck and right forearm of a radiologist during two weeks of routine fluoroscopy was about 84 milliroentgens per day. Two persons holding a baby under a 250 kv. therapy machine during three minutes exposure of 200 r each measured 60 milliroentgens on pocket chambers placed under lead aprons. It is generally true that even large amounts of radioisotopes can be handled with greater safety than is now the case in many standard x-ray and radium services.

TABLE 3.—*Exposure to Radioactivity During Surgical Operations (Milliroentgens Total Exposure to Hands and Body)*

	Surgeon			First Assistant			Assistant or Anesthetist		
Operation	Left Hand	Right Hand	Total Body	Left Hand	Right Hand	Total Body	Left Hand	Right Hand	Total Body
1. Laparotomy; 5 mc. Gallium^{72}, ½ hr. exposure time; diffuse source	Neg.	Neg.	10	Neg.	Neg.	10	..	..	10
2. Laparotomy; 100 mc. Gold^{198}, 2½ hr. exposure time; source in lesser omental space	155	75	40	35	35	10	50	..	10
3. Laparotomy; 100 mc. Gold^{198}, 2 hr. exposure time; source in peritoneal cavity	490	180	80	290	600	80	30	..	10
4. Implantation of Ra needles; 45 mc. radium; ½ hr. exposure time	760	450	90	360	470	90	..	..	..
5. Autopsy; 102 mc. Gold^{198}, 1⅓ hr. exposure time; source in peritoneal cavity	150	140	60	...	...	35	..	..	..

During the chemical preparation of a radioisotope, exposure of the hands is not ordinarily registered in the routine personnel monitoring devices. For example, during the hour it took to prepare four ampules of Ga^{72} citrate, the chemist received an exposure of 530 milliroentgens on his right hand and 355 milliroentgens on his left hand. If such exposures occur during a routine operation which must be repeated a number of times each week, the equipment must be redesigned to afford better shielding and the chemist must reeducate himself to modified procedures.

A common statement is that the injection of a radioisotope can be done more safely without shielding over the syringe if the operator moves fast. At best, however, the hands are exposed to measurable amounts of radiation. The injection of 1 mc. of gallium from an unshielded syringe over 50 seconds gave 13 milliroentgens to the left hand and 15 milliroentgens to the right hand. During the injection of 20 mc. of radiogold over 60 seconds, using an unshielded syringe, the total exposure was 60 milliroentgens to the left and 50 milliroentgens to the right hand. Radioiodine gives about the same exposure as radiogold, and even radiophosphorus gives off bremsstrahlung (soft x-rays) which can help build up hand exposure to supratolerable levels. If these so-called rapid procedures are carried out once or twice a week and are the only exposures that the hands receive during the week's work, there is little or no hazard to using unshielded syringes. But when the operation is just one part of other routine exposures, the maximum permissible dose accumulates rapidly and is exceeded quickly.

EXAMPLES OF SAFE HANDLING EQUIPMENT

In order to assure minimal exposure during routine operations, many devices have been designed. One of the distinguishing characteristics of radiochemical laboratories is a drawer full of homemade remote handling equipment and shielding gadgets. Many of these are better designs for specific purposes than any commercial items, for the obvious reason that the commercial houses cannot pick out a sensible compromise from the profusion of demands for specific tasks. However, now that radiochemical procedures are becoming relatively standardized, the number of commercially available devices for reducing radiation exposure is constantly increasing. The specific items described below are designs or developments of the Oak Ridge Institute of Nuclear Studies. They are not necessarily new and original and are adaptations of many persons' ideas. They have all been thoroughly tested and found adequate, and they are now commercially available to anyone.

The Shielded Syringe Holder.—The shielded syringe holder shown in Figure 5 was designed to take the maximum dimensions of the standard 10 cc. B-D glass tip or Luer lock syringes. It has two main parts, a lead shield for the syringe barrel and a plunger holder. The shield is a 5-lb. (2.3 kg.) chrome plated, hollow, lead cylinder with a projecting 4-in. (10 cm.) disk of ¼ in. (0.64 cm.) lead. The function of the disk is to shield the left hand A small slot in the cylinder end takes a plastic translucent prism and mirror, by means of which the contents of the syringe are visible at a 90 degree angle to the slot in the lead shield. A small set screw holds the plastic prism in position; it is removed during autoclaving. The plate closing the end of the cylinder is removable. On the plunger end is a thumb screw which when tightened locks down the plunger in a set position to prevent accidental discharge of syringe contents.

The plunger assembly is designed to clamp the top of the plunger so that the metal part becomes merely a rigid extension of the plunger itself; this assures perfect control of the injection. The plunger assembly also contains a pen-type flashlight battery and bulb (both sealed in); the light from this is transmitted down the plunger so as to improve greatly observation of volumes in the syringe.

The procedure for using the syringe holder is as follows: A known amount of radioactive substance is concerned, physician-patients leave something to be desired. Dr. W. M. Sams made the illuminating remark, "Physicians in my community suffer contact dermatitis from self-medication more frequently than they do from occupational exposure." Most dermatologists would agree with this.

Dr. Livingood pointed out that "I have found it necessary to hospitalize a fair number of these people in order to work out all of the etiologic factors because, for one thing, it is very difficult to obtain complete cooperation from physicians without hospitalization."

The average doctor in whom an eruption develops treats (or often overtreats) the condition himself. As a rule, he tends to change from one remedy to another in rapid succession because of failure to obtain immediate relief and because of personal doubt in his own diagnosis. Unfortunately, often these remedies consist of the detail-man's latest "miracle antibiotic," "nontoxic antihistaminic" or "omnipotent adrenal steroid." At times, the results are far from happy.

SUMMARY

1. Physicians are exposed to many irritating chemicals and infections in their professional routine.
2. Contact dermatitis is the commonest type of injury suffered, and among its more frequent causes may be listed scrubbing, gloves, local anesthetics, antiseptics, and antibiotics.
3. Psychosomatic influences may be important in such cases.
4. Infections are comparatively uncommon, but may be acquired accidentally from patients. A series of 27 cases of extragenital chancres in physicians was gathered during this survey.
5. Radiodermatitis is still occurring in physicians, but it is preventable and its occurrence is inexcusable.
6. Injuries are trivial and comparatively unimportant.
7. It is possible that physicians leave something to be desired as dermatological patients.

TUBERCULOSIS IN MEDICAL STUDENTS AND NURSES

H. D. Lees, M.D., Philadelphia

The very significant decline in mortality from tuberculosis in recent years stands out as one of the major achievements in the field of public health. One of the most encouraging features of the present-day picture is the more rapid rate of decline which has prevailed since 1945. Provisional figures for 1950 indicate the death rate to be 15% below that of the previous year. During the past five years tuberculosis mortality has declined approximately 42%. Since this presentation deals with the problem of tuberculosis in young adults, we must not overlook the very favorable mortality experience of this particular age group. In 1948 the number of deaths in the age group 15 to 24 years was 26.2% below that of the previous year. This very significant improvement in tuberculosis mortality bears a very direct relationship to the marked decrease in prevalence of tuberculous infection. Extremely low levels of infection have been reached in some areas. Jordan [1] has conducted a most comprehensive program of tuberculosis case-finding in Minnesota over a period of 20 years. He reports that in 128 schools in which tuberculin was applied to the entire enrollment not a single child reacted to the test. The tuberculosis death rate in this area is less than half of the rate for the entire country. At the University of Pennsylvania, 48% of undergraduate freshmen were tuberculin reactors in 1931 as compared with 18% in 1950. This is a reduction of 62.5%. Durfee [2] reported that the prevalence of tuberculous infection among college students in all sections of the country has declined 54.8% during a period of 15 years. Continued progress in our ability to control tuberculous infection during the next 10 years may conceivably result in a tuberculosis death rate of 12 or below by 1960.

TUBERCULOSIS IN MEDICAL STUDENTS

At present there are many encouraging aspects in the problem of tuberculosis in medical students. Several schools have succeeded in practically eliminating tuberculosis as a health hazard among their students. This can be accomplished only when we are able to identify those phases of training which provide unduly high infection rates and then by providing effective barriers against these sources of infection. The tuberculin test has permitted us to establish quite definitely the time of primary infection by its use at rather frequent intervals. It has been the most valuable procedure available to us in studying the epidemiology of tuberculosis in medical and nursing personnel.

The University of Rochester Medical School has had a rather unique experience, and a most gratifying one, in dealing with tuberculosis among its students. In 1948 Meade [3] reported that a careful analysis was made of students converting to tuberculin during the period 1937-1943. It was found that in six classes there were 139 students who were nonreactors at the beginning of the second year. By the end of the year 80.5% had become reactors. This is indeed a high attack rate of primary tuberculous infection during the short period of nine months. The courses in pathology seemed to provide the most definite elements of risk. All students attended and assisted at autopsies on tuberculous subjects and handled and examined unfixed tissues. In 1943 a program was

planned whereby all such contacts would be reduced to a minimum. Students were not permitted to attend autopsies on known cases of tuberculosis and fresh-tissue specimens were demonstrated by an instructor. Following the adoption of these measures the conversion rate among the next four classes dropped to 3.8%. Thus the incidence of primary tuberculous infection in second-year students was reduced 95%. How has this very effective means of controlling tuberculous infection in the student body influenced the more serious problem of students developing disease of the reinfection type? A recent communication from Dr. Ralph Jacox [4] of the University of Rochester is indeed very enlightening. He comments as follows:

> We feel that the chief reason for our decreased incidence of tuberculous infection is related almost entirely to the adequate control measures instituted in 1943. During the pre-control years the number of cases of clinical tuberculosis which developed among the medical student body was alarming. As many as seven or eight individuals out of a class of fifty to sixty in some years would develop radiographic and clinical evidence of pulmonary tuberculous infection. Since 1946 no cases of tuberculosis have developed among the medical student body.

Dr. Jacox reports also that during the past three years all patients admitted to the hospital have received chest x-rays. Thus their medical students are given every possible protection during their preclinical and clinical years.

The University of Minnesota Medical School has also developed a very effective program of tuberculosis control. Dr. J. A. Myers [5] recently summed up their program at the University of Minnesota in the following statement:

> Not many years ago an extremely serious tuberculosis problem existed among students of nursing and medicine at the University of Minnesota. In fact, as many as 4 to 10 per cent of students in medicine developed demonstrable tuberculous lesions before graduation. Every method of tuberculosis control, including the numerous so-called artificial immunizing agents, was given careful consideration. It was finally concluded that those who had treated tuberculosis as a contagious disease had the only method that had proved effective and offered future promise. Therefore, the program adopted at Minnesota consisted of protecting students against contagious cases of tuberculosis. This was done by (1) carefully examining for tuberculosis all patients upon admission to the hospitals; (2) requiring pre-employment examinations for all personnel and periodic examinations throughout periods of employment; (3) institution of contagious disease technique for all persons found to have contagious tuberculosis on admission to the hospitals and immediate removal or isolation of employees who developed this disease; (4) teaching students the importance of protecting themselves against contagion and also teaching them how to organize and direct contagious disease technique whether it be for an individual patient in a single room or an entire tuberculosis service. These precedures markedly decreased tuberculous infection among our students with corresponding reductions in morbidity and mortality. It has now been eight years since a student has fallen ill from tuberculosis while in school. Only one had a lesion large enough to be detected by x-ray film inspection. We have seen no reason for adopting BCG when the fundamental methods employed produced so much better results than any reported by the use of this living organism. We now consider our former students fortunate in that they did not receive any so-called immunizing agents consisting of living tubercle bacilli, including BCG.

In 1946 Morris [6] reported the results of a case-finding program among women medical students at the Woman's Medical College of Pennsylvania. This study covered a 12-year period during which time 449 students were under observation. During the first seven years, from 1932 through 1938, all students who entered as nonreactors to tuberculin converted before graduation. Fifty-six students developed tuberculous lesions, an incidence of 12.5%. Dr. Marion Boyd [7] has kindly provided me with complete data covering the experience at Woman's Medical College during the past five years. Of 50 students entering in 1950, only 18% reacted to tuberculin. From 1946 to the present time three students have developed pulmonary tuberculosis. During the past five years, therefore, the incidence of tuberculosis was approximately 85% below that of the period 1932-1943. Control measures believed to be largely responsible for this improvement are those which have been directed toward various phases of instruction in pathology. Students are not permitted to attend necropsies on tuberculous subjects and the pathologists use all possible precautions in demonstrating tissues in the laboratory.

At the University of Pennsylvania the control of tuberculosis among our students has presented a rather complex problem. Until recent years, almost all students who entered as nonreactors to tuberculin converted during their four years of training. The conversion rate was significantly higher among second-year students than in students of other classes. During this earlier period it was common practice to use advanced, open cases of tuberculosis for teaching purposes in classes in physical diagnosis for second year students. This has been discontinued. The department of pathology has cooperated by improving autopsy room techniques and by limiting the number of necropsies on tuberculous subjects which are attended by students. Three years after the adoption of this program 60% of nonreactors at entrance graduated without becoming tuberculin reactors. The incidence of pulmonary tuberculosis has decreased quite markedly. During the five-year period 1935-1940, pulmonary lesions developed in 40 students while in school. In the last five years the disease has developed in nine students with no new cases having been detected during the past two years. In our experience the development of tuberculous disease has been much more frequent among students entering medical school as reactors to tuberculin than among those who were nonreactors. Of 69 students who acquired significant lesions while in medical school, 51 (73.9%) reacted to tuberculin at the time of their entrance physical examination.

In view of the fact that tuberculosis ranked as a major health hazard among students at the above-mentioned medical schools, it is of interest to note that at Tufts College Medical School the disease has not been a serious problem. Dr. Dwight O'Hara,[8] Dean of the School, informs me that during the past 10 years tuberculosis has developed in only two students during their medical training. A report by Seifer [9] of the same institution indicates that students rarely have contact with tuberculosis either in the clinical phases of their instruction or in the autopsy room.

TUBERCULOSIS AMONG NURSES

Tuberculosis among nurses has presented a problem of real magnitude, especially in large general hospitals which maintain tuberculosis wards. Israel, Hetherington, and Ord[10] reported that at the Philadelphia General Hospital 48% of nurses who were nonreactors on admission to training became reactors during the first four months, and all converted before the end of the third year. Myers, Boynton, and Diehl[11] observed a conversion rate of 100% in nurses at a Minneapolis hospital having a tuberculosis service. Following the discontinuance of this service the percentage of conversions declined very sharply. In one class, not a single nurse acquired primary infection during three years of training. They call attention to the possible dangers of infection to nurses through exposure to a case of tuberculosis over a limited period of time. A patient with far-advanced pulmonary tuberculosis was in the hospital for 10 days, this being the only known admission at that time. Of 11 nonreactor nurses assigned to the care of this patient, 10 were found to be reactors three months later.

Numerous reports have been published since 1930 showing the incidence of tuberculous disease among nurses to be from 5 to 10%. Shipman and Davis[12] reported that in 6.7% of nurses at the University of California Hospital, pulmonary tuberculosis developed. At the Philadelphia General Hospital, which provides 396 beds for tuberculous patients, Israel[10] observed 637 nurses through three years of training in 68 of whom (10.6%) tuberculosis developed. Since 1946, the incidence of the disease has been reduced by more than 50%. Much more rigid contagious disease techniques have been put into practice and BCG vaccine has been employed on a voluntary basis. Nonreactors are not permitted to go on duty in the tuberculosis pavilion. Dr. David A. Cooper[13] who is in charge of the program reports that in two nurses who received BCG vaccine tuberculous lesions have developed. He states that the lesions were extremely minimal in extent, there was no tendency toward progression and clearing took place in a relatively short time. Kinney[14] reported that in two nurses tuberculosis developed two years after vaccination with BCG. In each case the disease developed shortly after service on a tuberculosis ward, indicating a presumably short incubation period of from four to six weeks. The onset was acute and explosive in each instance, although the clinical course of the disease was relatively benign and of short duration. Involvement of hilar and other lymph nodes was a main feature.

The control of tuberculosis in nurses can be achieved only through the utmost cooperation on the part of the hospital administration, supervising nurses, and nurses in training. All concerned must have an intelligent and sympathetic understanding of the risks involved. Nurses assigned to duty on tuberculosis wards are subject to a very definite risk of infection unless the most detailed and effective contagious techniques are maintained continuously. Education of the nurse through lectures and demonstrations is an essential part of the program. Ches x-rays on all adults admitted to the hospital should be a routine procedure, as a means of protecting nurses from unsuspected sources of infection. Close medical supervision should be provided for the nurse throughout her entire period of training. The tuberculin test should be applied during her first week in the hospital, and nonreactors should be retested at intervals of four months. Chest x-rays should be given all nurses at entrance and to all tuberculin reactors at least twice annually.

VALUE OF BCG VACCINE

Since the value of BCG vaccine has not as yet been clearly established, various committees and medical groups have recommended that its use be limited to medical and hospital personnel who may have repeated exposure to tuberculosis. It is suggested, also, that the vaccine should not be released for use among the general public. Present methods of preparation of BCG vaccine leave much to be desired. Dubos[15] has found that the numbers of viable organisms injected as an immunizing dose vary many thousandfold under the conditions of present-day practice. The early experimental work in cattle, confirmed quite recently by Medlar,[16] indicates that vaccinated animals are no more resistant to later infection with virulent tubercle bacilli than are the unvaccinated. De Abreu[17] recently reported tha in Rio de Janeiro there was a substantial *increase in* th tuberculosis mortality rate among infants and young children in spite of extensive use of BCG. During the period 1945-1948, the mortality rate among children from 1 to 2 years of age increased 62.5%. *During the same period* the tuberculosis death rate for all ages showed a significant decrease and especially so in the age group 20 to 40 years. The Council on the Management and Treatment of Diseases of the Chest[18] of the American College of Chest Physicians issued in January, 1951, a report on "The Present Status of Vaccination in Tuberculosis Control Programs." They say in part:

> It must be stated that there is no evidence that meets strict scientific requirements demonstrating that *BCG effects the control of tuberculosis*, despite the suggestive results of a few studies. Because there is no general agreement among investigators anywhere in the world on such fundamental matters as the preparation of the vaccine, the method of vaccination, what constitutes a successful vaccination, how resulting immunity may be measured or how long such immunity lasts, the procedure would seem to be still in the investigational period.

We know that primary infection with virulent tubercle bacilli does not confer a high degree of immunity against subsequent infection and disease. It is unreasonable to expect, therefore, that attenuated organisms may be more effective as an immunizing agent. The control of tuberculosis among medical students and nurses presents a for-

midable problem wherever they may have repeated contacts with patients having the disease in a communicable form. Vaccination with BCG should under no circumstances be employed as a substitute for those measures which have proved so effective in preventing infection with tubercle bacilli.

University of Pennsylvania.

CLINICAL NOTES

TREATMENT OF MENINGITIS BY INTRACISTERNAL INJECTION OF CHLORAMPHENICOL

Olavo Trindade, M.D.
and
Francisco Nastari, M.D., São Paulo, Brazil

In 1947, Ehrlich and collaborators [1] isolated Streptomyces venezuelae, N. sp., from a soil sample obtained near Caracas, Venezuela. Filtrates of S. venezuelae cultures were found to have marked antibiotic activity against several gram-negative bacteria, principally Shigella paradysenteriae (Sonne). This new antibiotic in crystalline form is a neutral compound, is stable in aqueous solution for over 24 hours at a pH 2 to 9, and in distilled water is unaffected by boiling for 5 hours. At 25 C its solubility in water is about 2.5 mg. per milliliter. It is very soluble in propylene glycol, butanol, ethanol, acetone, and ethyl acetate. In vitro tests against gram-negative organisms demonstrated the new antibiotic to be 7 to 36 times as active as penicillin and approximately 2 to 16 times as active as streptomycin. Against Mycobacterium tuberculosis, it is approximately one-tenth as active as streptomycin.[2] The drug showed remarkable tuberculostatic action [3] against the majority of 19 human-type strains studied in concentrations of between 6.25 and 12.5 γ per milliliter in the presence of serum. One bovine strain was equally sensitive. Payne and co-workers [4] first employed the drug in the treatment of 16 patients with epidemic typhus. They administered it by oral and intravenous routes.

Chloramphenicol (chloromycetin®) is the chemical synthetic form of the antibiotic, and it has the same physical and chemical properties as the product obtained by fermentation.[5] It is rapidly absorbed, inactivated, and excreted.[6] In man, the drug is excreted largely in the urine, principally in the form of inactive products. After oral administration, a single dose of the drug produces an evident blood level within 30 minutes. At the end of eight hours it has disappeared from the blood, and about 90% of the total amount administered is received in the 24-hour urine specimen. The distribution of the antibiotic in the tissues of a dog is not uniform; there are high concentrations in the liver and kidneys and smaller amounts in the brain and spinal fluids. Clinically, the drug has been shown effective in the treatment of patients with rickettsial diseases, typhoid, and brucellosis, evidencing low toxicity for human beings.[7]

The case reported here is interesting not only because it concerns an uncommon disease—meningitis due to Shigella paradysenteriae—but also because it suggests another route for the administration of chloramphenicol to humans. Prior to this case, the antibiotic had been given only orally and intravenously, and only the oral route had been recommended.

REPORT OF CASE

History.—The patient was a white man, aged 22, who had been ill for three days prior to admission. He complained of headache and had an axillary temperature at times reaching 105.8 F. He was admitted to the emergency section on Feb. 6, 1950, with complaint of pain low over the right side the day before, followed by nausea and vomiting. He felt hot and dizzy and had headache and blurred vision.

Physical Examination.—The patient's axillary temperature was 101 F, rectal temperature was 103 F, pulse rate 140, respiratory rate 24, and blood pressure 90 systolic and 65 diastolic. His weight was 70 kg. Examination of the head of the respiratory and circulatory systems showed nothing unusual. Gentle palpation revealed muscle rigidity in the right lower quadrant of the abdomen, and deep palpation caused sharp pain.

Hospital Course.—A diagnosis of acute appendicitis was made. With the patient under spinal anesthesia (3 cc. of 5% procaine hydrochloride solution) immediate appendectomy was performed through a McBurney incision. A phlegmonous appendix was found, which was ruptured during the operation. The peritoneal cavity was drained for two days. The cerebrospinal fluid obtained by lumbar puncture was clear. After the appendectomy the patient was given sulfacetamide intravenously, 1 gm. every six hours, penicillin intramuscularly, at first 50,000 units and afterward 100,000 units every three hours, and adequate amounts of fluids and vitamins.

In the afternoon after the operation, the patient's temperature rose abruptly to 104 F, and his condition was poor. His blood pressure was 130/70 and pulse rate 140. He had a headache, slight nuchal rigidity, and obnubilation. Convulsions occurred frequently, and establishment of an airway was necessary. Streptomycin was given intramuscularly, 0.25 gm. every six hours. The next day the patient's condition was worse. The severity of his headache increased, nuchal rigidity was still present, and photophobia developed. Kernig's and Brudzinski's signs could be elicited. Intracisternal puncture yielded grossly cloudy fluid, under marked pressure and spurting from the needle. The cell count was 9,333 leucocytes per cubic millimeter, all polynuclears. Glucose content was 65 mg. per 100 cc. Direct smear demonstrated gram-negative bacilli. Cisternal fluid culture was required. At this time an injection of 50,000 units of penicillin was given cisternally. The administration of sulfacetamide was discontinued, and peroral administration of sulfadiazine was begun.

On the third day lumbar puncture revealed turbid fluid, and the patient was immediately given 50,000 units of penicillin intrathecally. On the fourth day there was still no improvement in the patient's general condition. The temperature still rose as high as 104 F, and the same meningitic signs became more

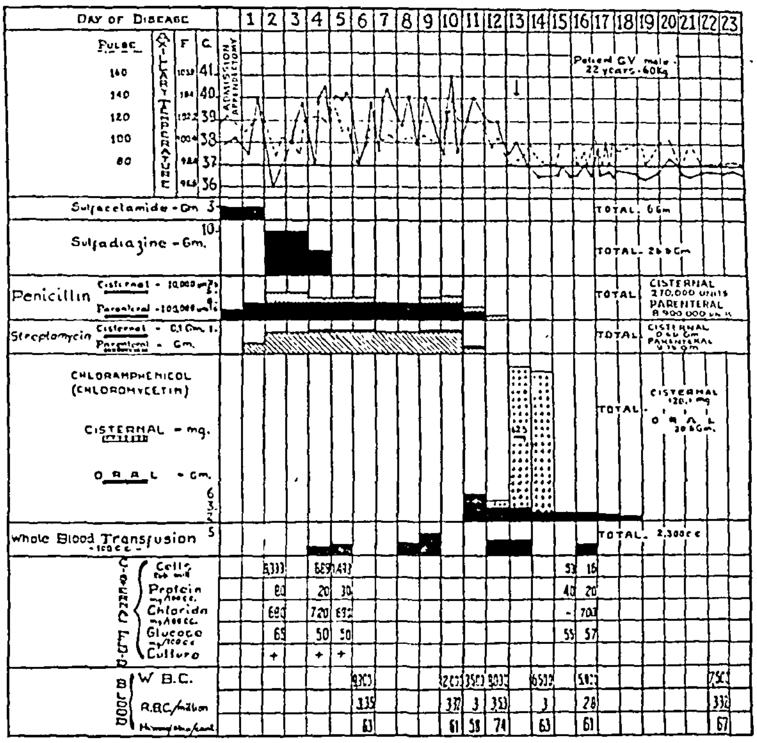
intense as the patient became stuporous. Slight cyanosis was present. In contrast to the exacerbation of the symptoms, the cisternal fluid that day contained only 688 cells per cubic millimeter, 80% of which were neutrophil leucocytes. The patient was given 20,000 units of penicillin and 0.1 gm. of streptomycin cisternally. Sulfadiazine therapy was stopped, and he was given increased fluids and vitamins and a blood transfusion. On the fifth day the cisternal fluid contained 1,493 cells, 85% of which were neutrophil leucocytes. He was given cisternally 20,000 units of penicillin and 0.1 gm. of streptomycin.

By the sixth day, in spite of the medication, the patient's general condition was growing worse; stupor increased, the temperature maintained a high level, and the cisternal fluid remained turbid. The patient received cisternally 25,000 units of penicillin and 0.1 gm. of streptomycin. On the following day his condition was almost unchanged. He was delirious at times. The cisternal fluid was still cloudy. He was again given 25,000 units of penicillin and 0.1 gm. of streptomycin by cisternal route. The next day the axillary temperature rose to 105.8 F. The patient was extremely restless and not aware of his surroundings. Cisternal puncture revealed cloudy fluid. He was given cisternally 30,000 units of penicillin and 0.1 gm. of streptomycin. The patient's general condition was still unchanged on the 11th day. His temperature remained high: 104 F. Cisternal fluid continued to appear dull. He was given cisternal injection of a mixture of 25,000 units of penicillin and 0.1 gm. of streptomycin. At this time the culture of the first cisternal fluid specimen, which had been obtained the second day of the disease, revealed that the causative agent was S. paradysenteriae; therefore, treatment by penicillin and streptomycin was discontinued and oral administration of chloramphenicol was begun. The inital "loading" dose of 3 gm. was divided and given in two doses one hour apart. These were followed by additional doses of 0.25 gm. every two hours for three days, then every three hours for three days, and, finally, every four hours for two days. By the 18th day the patient had received orally a total amount of 20.5 gm. over an eight-day period.



Summary of clinical data in case reported.

On the 12th day, however, there was little clinical improvement. The temperature had decreased to 103 F, but cisternal fluid remained turbid. Considering the low cerebrospinal levels obtained orally,[6] Dr. Trindade thought of introducing the drug directly into the cisternal fluid to obtain higher concentration levels with total utilization of the antibiotic. A solution was prepared by diluting 0.25 gm. of chloramphenicol and 200,000 units of penicillin in 10 cc. of saline solution. A dose of 1.25 cc. was injected, containing about 3.1 mg. of chloramphenicol. There was no untoward reaction.

The next day, the patient evidenced some relief from headache, but the general condition and symptoms remained unaltered, and the temperature did not decline from 100.4 F. Although the chloramphenicol-penicillin preparation had been kept under refrigeration overnight, it showed crystallized sediment and therefore had to be discarded. Cisternal fluid obtained by puncture was still as dull as on all the previous daily samples. Since the infection persisted in spite of the therapy used, it was decided to increase the cisternal amount of the drug. A new suspension-solution was prepared by suspending 0.25 gm. of chloramphenicol in 20 cc. of isotonic sodium chloride solution, and a dose of 5 cc. was administered cisternally. The chloramphenicol content of this dose was 62.5 mg. or approximately 1 mg. per kilogram of body weight (the patient weighed 60 kg.). The injection was made slowly and cautiously by barbotage, and the portion of the drug in suspension was dissolved in the cisternal fluid.[1]

On the 14th day, 24 hours after this treatment, the patient showed marked improvement. His temperature decreased to 98.2 F. His pulse rate was 88, blood pressure 100/65. The headache and photophobia had disappeared, and nuchal rigidity had lessened. The patient regained consciousness and was able to answer all the questions clearly. Immediate cisternal puncture yielded crystal-clear fluid and normal pressure. The dose of 62.5 mg. was repeated. The patient continued to improve the following day. He was conscious, afebrile, and euphoric. The cisternal fluid was clear and slightly xanthochromic. It contained 53 cells per cubic millimeter, 65% of which were lymphocytes. By the next day the cisternal fluid was still clear, containing only 16 cells per cubic millimeter, 75% of which were lymphocytes. The fever did not recur, and the patient's condition continued to improve gradually, the nuchal rigidity decreasing every day, until he could again move his head and sit up in bed. When oral administration of chloramphenicol was discontinued, on the 18th day, the patient had received a total amount of 20.5 gm. perorally and 128.1 mg. cisternally.

On the 22nd day Widal and Weil-Felix tests were negative. Liver function tests indicated unchanged function of the hepatic cell. Blood, urine, and stool examination and culture proved negative for S. paradysenteriae. The cisternal fluid was clear and colorless, having 20 cells per cubic millimeter, all mononuclears. No blood culture was made during the acute phase of the disease. The patient was discharged on the 37th day, *fully* recovered, without neurological sequelae.

Follow-up Observations.—When examined, two weeks after discharge, the patient was in good condition. Cisternal puncture showed clear fluid, 16 cells per cubic millimeter (mononuclear leucocytes), protein 15 mg. per 100 cc., chlorides 680 mg., and glucose 71 mg. per 100 cc. There were no bacteria, either on direct smear or on culture. On reexamination, three months after cisternal chloramphenicol therapy, the patient had gained weight and was in excellent health. The cisternal fluid was clear and had only one cell per cubic millimeter. Protein was 10 mg. per 100 cc., chlorides 710 mg., and glucose 71 mg. per 100 cc. There were no bacteria, either on direct examination or on culture.

COMMENT

Acute Shigella paradysenteriae meningitis was observed in a patient after appendectomy under spina anesthesia. It was perhaps due to complications of contamination at the time of puncture or to simultaneous bacteremia or septicemia; unfortunately, no blood cultur was made during the acute period of the disease.

Sodré, Croce, and Cunha [8] have competently reviewe the literature on septicemia caused by S. paradysenteria which includes 150 cases between 1901 and 1949. W have reviewed the available literature on meningitis the same origin and believe the present case to be th first ever reported. In spite of normal spinal fluid glucos levels, the case may be classed as severe from the stanc point of temperature and general condition.[9]

9. Trindade, O., and Nastari, F.: Intracisternal Chloromycetin in Man, Rev. paulista de med. 36: 369, 1950.

Although the patient had been properly treated with penicillin, streptomycin, and sulfonamides, and although chloramphenicol had been given orally for two days together with a small injection of 3.1 mg. cisternally, no evident improvement could be observed after a period of 12 days. At this time a "loading" dose of 62.5 mg. of chloramphenicol was administered intracisternally with excellent results. Indeed, 24 hours after this administration the clinical picture was completely changed, the patient being almost cured.

In our experiments [10] dogs received cisternal doses of 2 mg., 5 mg., and 10 mg. per kilogram of body weight. These animals tolerated the administration and recovered spontaneously. Dogs inoculated intracisternally with S. paradysenteriae did manifest meningitis clinically but recovered spontaneously; the cisternal fluid was turbid 24 hours after inoculation, with increased pressure, but culture was negative. In vitro test cultures of S. paradysenteriae grow well in the spinal fluid of the dog but poorly in its serum.

Tuberculostatic levels of the drug [9] can easily be obtained in the spinal fluid by cisternal or intrathecal routes, which suggests its use in the treatment of the tuberculous meningitis. Further clinical studies will afford a more accurate appraisal of its value. To our knowledge there has been no previous report on therapy with chloramphenicol by cisternal or intrathecal routes.

SUMMARY

A patient with severe Shigella paradysenteriae meningitis following spinal anesthesia recovered fully with chloramphenicol (chloromycetin®) therapy. A new route was successfully used, and recovery is attributed principally to the intracisternal administration. The dosage employed was 1 mg. of the drug per kilogram of body weight. We recommend the intracisternal route of administration because the antibiotic can be easily sterilized by boiling and possesses low toxicity.

Appendectomy During Cholecystectomy.—The appendix should be examined routinely before a cholecystectomy is performed, even though a definite pathologic condition exists in the gallbladder, for studies have shown frequent coexistence of appendical lesions. The examination should be done with care, because an inflammation of the appendix, especially of the catarrhal type, can be easily overlooked if the inspection is cursory and the surgeon's mind is centered on the gallbladder pathology.

The fact that the appendix may produce trouble subsequently if allowed to remain, and that it can be removed during cholecystectomy with little added risk, indicates that it should be removed routinely whenever it is accessible. If the cholecystectomy incision does not permit the appendectomy, the organ should be carefully examined by palpation for the presence of a fecalith or any abnormality. If a fecalith is found, it is advisable to remove the appendix by extending the gallbladder incision or by making a separate McBurney or gridiron incision. An elective appendectomy may be necessary at a future date, if the condition of the patient does not permit an immediate appendectomy.—Tokuso Taniguchi, M.D., and Frederick A. Stratton, M.D., Prophylactic Appendectomy During Cholecystectomy, *Wisconsin Medical Journal*, October, 1951.

AN EARLY CLINICAL SIGN OF VENOUS THROMBOSIS

Arthur J. D'Alessandro, M.D., Newark, N. J.

Venous thrombosis, with its insidious onset and disabling, if not tragic, complications, is receiving more attention than ever by surgeons, internists, and obstetricians. As medical science conquers more and more of the traditional foes of mankind, it becomes only natural that intravascular clotting command and receive more attention. Furthermore, with the ever-increasing elective invasion of heretofore unexplored surgical fields, the problem of postoperative venous thrombosis becomes even greater.

Whether or not venous thrombosis is actually on the increase, the medical profession has become more conscious of the problem, so that routine postoperative examination of the lower extremities is a daily function of all surgical residents and surgeons, and should be for obstetricians and internists as well, especially in the elderly bedridden patients.

Much of the difficulty in the management of thromboembolism is due to the fact that diagnosis is frequently not established until serious embolic manifestations have arisen. Recently Dr. Kay, working in the Ochsner laboratory, reported that thrombosis was favored by a lowering in the antithrombin content of the plasma and that this lowering could be successfully combated with alpha tocopherol and calcium. Unfortunately, this test has not had sufficient trial to be confirmed or refuted by other investigators. My experience in more than a year has not justified the initial confidence in the test, but final approval or condemnation of the test will be deferred, pending further studies.

In the absence of any truly reliable and practical laboratory test, the early diagnosis of venous thrombosis depends on clinical judgment and acumen. The following important diagnostic signs and symptoms of thromboembolism (the two processes are so closely interrelated that they may be considered as one syndrome) are generally described in the literature: (1) pain with or without tenderness over the calf muscles, malleoli, or plantar surfaces; (2) pain on dorsiflexion of the foot with leg extended (Homan's sign); (3) swelling of the leg; (4) unexplained rise in pulse or temperature; (5) chest pain, with or without cough or bloody expectoration; (6) apprehension, pallor, nervousness, or a "feeling of impending disaster"; (7) cyanosis of the legs; (8) temperature differences in the legs; and (9) the sentinel veins of Pratt.

To these I should like to add a fairly constant, simple and early sign that I have found to be of great value in my clinical practice. In the past five years, I have become increasingly aware, particularly on palpating the femoral pulse preparatory to vein ligation, of the significance of marked diminution or even absence of the femoral pulse in the affected extremity. This phenomenon has invariably been present, even in the absence of other appre-

---

Assistant Surgeon, Peripheral Vascular Service, Presbyterian Hospital and Newark City Hospital.

ciable signs or symptoms, and has served as a useful guide to therapeutic unilateral femoral vein ligation followed by anticoagulant (heparin) therapy, my present method of management of these cases. For example, in the past six months I have had two cases of serious but nonfatal pulmonary emboli in which this unilateral change in the femoral pulse was the only significant clue to the affected extremity.

The physiological mechanism for the sign may be understood when one considers the marked and early angiospasm that attends all vascular accidents to any extremity, regardless of the location of the thrombus. The degree and significance of this angiospasm is readily appreciated by anyone who has successfully performed a lumbar sympathetic block on a patient with venous thrombosis.

The change in the femoral pulse occurs early in both thrombophlebitis and phlebothrombosis, long before there is any demonstrable edema or swelling. This sign has the additional advantage of being apparent without the aid of any apparatus. Observation of the femoral pulse should be part of the daily postoperative routine, so that appropriate therapeutic measures may be taken when indicated.

SUMMARY

A simple bedside test of diminution or absence of the femoral pulse in the lower extremities is reported as another diagnostic aid in the early detection of venous thrombosis.

The Presbyterian Hospital, S. Ninth St. and Ninth Ave.

FATAL AIR EMBOLISM IN PREGNANCY

Melville L. Cody, M.D.
and
Philip D. Windrow, M.D., Houston, Texas

Air embolism is not an uncommon complication when diagnostic or therapeutic measures using air under pressure are employed. Air embolism also occurs when the air is not under pressure. In either instance there must be a break in the continuity of a vessel, either artery or vein, and the open vessel must contain blood under less pressure than the surrounding air. Of particular interest and concern to the obstetrician are those situations involving the female genital tract that may give rise to air embolism during or shortly following pregnancy.

Forbes[1] reported the case of a woman dying suddenly at three months pregnancy apparently after a self-administered douche. Autopsy revealed the right side of the heart and the pulmonary artery to be filled with frothy blood. Deadman[2] reported four cases of fatal air embolism in women anywhere from three and one-half to seven months pregnant. In three of these a Higginson syringe had been used to inject fluid to induce abortion. Air was inadvertently injected along with the fluid. Fatal air embolism following attempts at abortion, in which trapped air is forced into the uterus along with various other materials, is not rare; there are many reported instances. Also, fatalities have resulted from air embolism following vaginal insufflations during pregnancy.[3] Patients have died from air embolism as a result of assuming the knee-chest position as part of their postpartum exercises.[4]

As a complication of delivery, fatal air embolism has been considerably rarer, judging from the relatively few reports in the literature. Osborn and Dawson[5] reported two such fatalities in 1938. The first was in a primigravida on whom a cesarean section was done for dystocia. During the operation the patient's blood suddenly became dark, and a general cyanosis was apparent. The uterus did not respond well to oxytocics, and there was considerable hemorrhage. One-half hour after the operation she became quite cyanotic, cried and waved her arms about. She died three hours after the operation. Autopsy showed air bubbles in the right side of the heart. The placental site was left anterior at the fundus. The second fatality, a primigravida, died mysteriously one hour after a normal spontaneous delivery. Shortly before death, when a nurse expressed some clots, the patient collapsed, became restless and cyanosed, and waved her arms about. Autopsy revealed many air bubbles in the right auricle and ventricle and in the pulmonary artery. In 1947 Mylks, Brown, and Robinson[6] reported a patient who hemorrhaged during labor from a low-implanted placenta with separation. One-and-a-half hours before delivery she went into shock, became restless, and was cyanosed. She died one-half hour after delivery of a stillborn baby. At autopsy air bubbles escaped when the vessels of the breast were cut. Air bubbles were also in the right ventricle.

REPORT OF CASE

History.—P. M., a 42-year-old woman, gravida 3, para 2, had been regular in her attendance at the clinic, and her prenatal course was uneventful except for development of polyhydramnion, noted on Dec. 2, 1950. Fetography showed one fetus in breech presentation, with no fetal abnormalities apparent. The expected date of confinement was Jan. 27, 1951. The patient was first admitted to the hospital on Jan. 11, 1951, because of suspected ruptured membranes. After a four-day hospital stay, during which time she received penicillin, she was discharged with no further evidence that the membranes were actually ruptured. The patient was next admitted to the hospital on January 30 because of the onset of labor.

Physical Examination.—There was a generalized urticarial rash over the entire body, which had been present for about three days according to the history. Bright red blood was present on the perineum, but no active bleeding was noted at this time. The size of the uterus was compatible with a gestation of approximately 34 weeks. The fetus was thought to be in a transverse presentation. Fetal heart tones were not audible. The blood pressure was 120/75, pulse rate 120, and temperature 99.8 F. During fetography an episode of vaginal bleeding occurred (about 200 cc. of bright red blood). The roentgenogram revealed a complete

right sacrotransverse breech presentation. Speculum examination revealed placental tissue to be covering the entire internal os. The patient was taken to the operating room, where the diagnosis of placenta previa was confirmed by an attending staff member. The cervix was dilated 6 cm.

Hospital Course.—A transverse, low-flap cesarean section was done under cyclopropane, ether, and nitrous oxide anesthesia without incident, and a stillborn fetus weighing 2,120 gm. was delivered. The placenta completely covered the internal os and extended up anteriorly and to the right. The patient's general condition was good immediately after the operation. At this time the blood pressure was 130/80 and the pulse rate 120. Twenty minutes later the blood pressure had dropped to 80/60, and the pulse rate had risen to 144. Ten minutes later the blood pressure was 75/40. There was no definite evidence of intra-abdominal hemorrhage and no unusual external bleeding. The abdomen was soft, and the uterus felt firm. The lungs were clear. The urticarial rash seemed to become larger and more diffuse. Shock therapy, including oxygen, morphine, and rapid blood transfusion, was being carried out. The patient became very dyspneic after the onset of shock and did not respond to medication. She became markedly cyanotic; respirations became more labored; and she died 65 minutes after operation.

Laboratory Data.—The patient's blood type was O, Rh positive. On admission the hemoglobin value was 16 gm. per 100 cc. Findings from urinalysis were essentially negative. Repeat blood typings and cross-matchings after death revealed no error.

Autopsy Findings.—Autopsy was performed eight hours after death. When the pulmonary artery was opened in situ, air bubbled out freely and was apparently under some pressure. The right auricle and ventricle contained frothy blood. The peritoneal cavity contained approximately 300 cc. of dark blood. The uterus was firm and measured 15 x 15 x 10 cm. The incision was in good apposition, all sutures being in place. One small blood clot was in the right cornu of the uterus. Open vessels could not be demonstrated on the inner surface of the uterus. Microscopic examination revealed no further information.

COMMENT

It appears that under certain conditions the pregnant uterus is peculiarly adapted to becoming an entrance for air. The entrance is usually through one or more open vessels subjacent to the separated or partly separated placenta. Entrance may also be created during operative procedures such as cesarean section, by cutting across vessels in the uterine wall. When a cesarean section is done in the presence of uterine bleeding, when there has been separation of the placenta, one may expect the chances for air embolism to be enhanced somewhat. Air embolism as a complication of delivery probably occurs oftener than is generally supposed, and is undoubtedly the cause of some unexplained maternal deaths.

In patients dying of air embolism marked cyanosis is almost invariably present unless death is instantaneous. This anoxia, the probable cause of death, would seem to be brought about principally by two mechanisms. First, the heart fills with compressible air. Thus, with each heart beat much of the force of the beat is taken up in compressing the air rather than forcing a normal amount of blood through the vessels. Second, the blood is whipped into a froth, and reaches the lungs as such, preventing a normal exchange of gases. It is, of course, possible for some air bubbles to get through the capillary bed into the general circulation; or air might, on occasions, be shunted into the general circulation before reaching the lungs. If bubbles reach the vessels of the brain, heart, kidneys, or other organs, one could expect various symptoms characteristic of the organ or organs involved.

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

The Council has authorized publication of the following report. R. T. Stormont, M.D., *Secretary.*

A CONTROLLED STUDY OF PAIN RELIEF BY INTRAVENOUS PROCAINE

Arthur S. Keats, M.D.
Genesio L. D'Alessandro, M.D.
and
Henry K. Beecher, M.D., Boston

Since 1947, almost 50 publications have appeared which report that many varieties of pain as well as edema, muscle spasm, itching, symptoms of asthma, and certain eye diseases have been relieved by intravenous procaine. Most observers have reported that the side-actions are minimal and of little consequence. Despite the necessity of controls in investigations of this type, no observer (known to the authors) in studying the beneficial effects of this drug has treated a comparable group either with a placebo or with a standard therapeutic agent. Both kinds of comparison are essential. In addition, the known rapid hydrolysis of procaine in the blood stream [1] and the slight or absent analgesic effects of its break-down products [2] (paraaminobenzoic acid and diethylamino ethanol) are not in accord with the prolonged pain relief reported. For these reasons, a controlled study of pain relief by intravenous procaine was undertaken.

METHOD

The method of study is that previously used by the authors to estimate the analgesic power of barbiturates.[3] Patients who had undergone major surgical procedures and who developed constantly present wound pain of moderate or severe degree on the first postoperative day were the subjects of this study. Any patient with a history suggestive of procaine sensitivity was not included in the study. When a suitable degree of pain developed, the patient was given the first drug of a series (saline, procaine, morphine) and the degree of pain relief evaluated at specific intervals thereafter (usually 30 and 60 minutes). If little or insufficient relief was obtained, the second drug was given and its effect again evaluated after specific intervals. The third drug was given and evaluated similarly. If pain relief was obtained after any dose, the subject was observed at intervals until his pain returned to approximately the original level and then the series of drug administrations continued as described. Not every subject received all three drugs, because, in many, pain did not return within the experimental period (8:00 a. m. to 6:00 p. m. of the first postoperative day). In others, the pain which returned was milder or of different type and could not be used for further testing.

The three drugs employed were saline, procaine hydrochloride, and morphine sulfate. Procaine was given as a 0.1% solution in 5% dextrose in water through an intravenous infusion set. The doses used will be discussed below. Saline was given in a similar manner at a rate of approximately 200 cc. per hour. Intravenous morphine was given slowly by syringe over the

course of one minute. The dosage was always 8 mg. per 70 kg. of body weight. A physician was present constantly during the administration of the drugs and recorded the side-actions. All evaluations of pain relief were made by trained technicians who were unaware of the nature or dose of the drug administered. The technicians appeared only at the specific times for evaluation and were not present during the entire drug administration. Criteria for evaluation were established rigidly and all technicians were indoctrinated with the same standards.

Drug effects were judged by their ability to produce both pain relief and comfort. In previous work with analgesics, it was observed that pain relief was not always associated with comfort; that is, satisfaction by the patient with the results produced. Some patients, while claiming to be relieved of their pain, were not content because they continued to be tense, restless, and bothered by tubes, catheters, or nausea. Others, although claiming that their pain was unchanged, appeared comfortable as a result of the drug and did not wish further medication. The authors believe that analgesics are therapeutically effective when they provide comfort with or without pain relief, and have evaluated the efficacy of any single dose in terms of the four possible categories: (*a*) no comfort, no pain relief; (*b*) no comfort, pain relief; (*c*) comfort, no pain relief, and (*d*) comfort, pain relief. The latter two categories represented the desired effect both from the physician's and the patient's viewpoint. Further justification for these categories as well as further details of the method can be found elsewhere.[3]

RESULTS

A total of 53 patients divided into four groups was studied. The initial group of 12 patients was given saline first, followed by procaine, and finally, morphine. The dose of procaine used was the "procaine unit" (4 mg. per kg. of body weight administered over a 20-minute period).[4] Saline and procaine were administered for 20 minutes, and evaluations of all drugs were made 30 minutes after each administration. Because of the poor results in this initial group (Table 1), further use of this dosage did not seem advisable.

Therefore, a second group of 16 patients was studied with the same order of drug administration except that procaine was now administered up to the limit of tolerance for 20 minutes (as rapidly as possible without producing unpleasant side-actions) and then allowed to drip in slowly for the next 40 minutes. Evaluations were made at 30 minutes and 60 minutes. This allowed for evaluations after both rapid and slow administrations and after two widely different doses. The results are shown in Table 1, Group II.

The frequent failure of saline to relieve pain initially and the discomfort commonly associated with intravenous drip administration were considered as possibly providing a negative conditioning factor against relief from any drip medication. Therefore, in the third group procaine was given initially, followed by saline, and then morphine. Procaine here has the additional advantage of being credited with relieving those patients who would have obtained relief from a placebo. The dosage and technique were the same as in Group II. This modification produced some increased pain relief but not much increase in comfort. Also, its results did not equal those of morphine. The low number of administrations of saline and morphine resulted from five patients having no return of pain and from other patients having reactions to procaine that were too distressing to make further study advisable.

TABLE 2.—*Dose of Intravenous Procaine Used in Various Groups**

Group	Mg. per First 20 Min.		Mg. in Excess of the "Procaine Unit," Mean	Mg. per Hour	
	n†	Mean		n†	Mean

* Patients in whom administration was stopped because of severe toxic reactions are omitted. The dosage is expressed as mean ± standard error of mean.

† Number of patients included.

‡ Given with equal amounts of ascorbic acid.

Because of the claims that the addition of ascorbic acid decreases the toxicity of intravenous procaine,[5] a fourth group was studied in an attempt to decrease side-actions while retaining whatever analgesic potency that might be present. Saline was not given to this group and the procaine-ascorbic acid mixture was given first, in the favorable order, as a 0.1% procaine-0.1% ascorbic acid solution. The rate of flow was adjusted to give minimal side-actions but maximum flow. The solution was allowed to run for one hour. Morphine followed the procaine-ascorbic acid. The addition of ascorbic acid permitted the administration of greater amounts of procaine than otherwise would have been possible without serious side-actions; this is indicated in Table 2. However, this increased dosage was not accompanied by increased analgesia; this is shown in Table 1, Group IV.

When the data of the first three groups only are combined (Table 3), it is apparent that, although intravenous procaine does possess some analgesic power, its effect is considerably less than that of morphine. This remains true even when pain relief alone is considered. Judging from previous work of the authors,[3] the analgesic power of procaine, when administered as specified, is of the same order as that produced by 90 mg. of pentobarbital sodium.

TABLE 3.—*Comparative Effects of Intravenous Saline, Procaine, and Morphine on Postoperative Pain*

The frequency of side-actions following each drug is recorded in Table 4. In addition to those listed, faintness, weakness, drowsiness, lightheadedness, a "flushed" feeling, and dulled hearing were noted after procaine; a "woozy" feeling, generalized warmth, transient abdominal cramps, and drowsiness were reported after morphine. One patient claimed to have generalized numbness and a metallic taste in his mouth for one week after procaine. Another claimed that one-half of his body was numb

5. Graubard, D. J., and Peterson, M. C.: The Therapeutic Uses of Intravenous Procaine, Anesthesiology 10: 175-187 (March) 1949.

for several hours after procaine. Blood pressure was recorded during administration of the drugs, but no hypotension was observed.

An alternate method of tabulating the data is presented in Table 5. Response A indicates no pain relief with or without distressing side-actions; response B, pain relief with distressing, highly unpleasant, or serious side-actions; response C, pain relief with minor or no unpleasant side-actions. This method is said to provide an index of clinical usefulness for each drug.[6] The general picture differs little from that presented above.

TABLE 4.—*Relative Side-Action Liability*

No. of subjects	34	40	10	35

Others following procaine (less than 5% frequency): convulsions, disorientation, paresthesias, tinnitus, and restlessness.

DISCUSSION

The hypothesis advanced to explain the analgesic power of intravenous procaine[7] states that increased capillary permeability exists in areas of trauma or inflammation allowing larger amounts of procaine (given intravenously) to accumulate in the diseased tissue than in normal tissues. This allows for blocking of local nocicepter nerve fibers which, when stimulated, arouse reflex vasospasm and accentuate the existing pain by anoxia and edema. Procaine interrupts this "vicious circle" and provides pain relief and improved healing by an increased blood flow. If this were true, the postoperative patient, with his very real area of trauma and inflammation, should provide the ideal subject for analgesia by intravenous procaine. Unfortunately, our data do not support this hypothesis.

It is more likely that any analgesia produced by intravenous procaine results from its action on the central nervous system. In 1944, Bigelow and Harrison[8] demonstrated that subcutaneous infiltration of procaine into one arm produced an elevation of pain threshold in the opposite arm. Although it is generally accepted that pain threshold measurements bear little relationship to analgesic effects, this observation can be construed as indicating that systemic absorption of procaine alters the psychic reaction to painful stimuli. It is possible that any drug which has effects on the psyche (as procaine has) can relieve pain to some extent simply by the distraction produced by the multitude of psychic stimuli aroused by the drug.

* No pain relief with or without distressing side-actions.

† Pain relief with distressing, highly unpleasant, or serious side-actions.

‡ Pain relief with minor or no unpleasant side-actions.

It is interesting to find that the best results with this drug have been reported in the treatment of those symptoms with a large psychic overlay (low back pain, itching, tinnitus), or those diseases notorious for the vagary of their symptoms and spontaneous remissions (arthritis, serum sickness, angina pectoris), or those conditions associated with minor degrees of pain (certain sprains, fractures, and burns, and following thyroidectomy and radical breast excisions). Once again the occasion arises for a plea for the use of controls in all investigations and for rigid controls (both for patient and observer) in investigating pain.

In the group of patients studied at the Massachusetts General Hospital, intravenous procaine relieved 40% of the patients in contrast to 20% with saline and 70% with morphine. (The 30 minute evaluations are used because of the greater amount of such data.) Despite the relatively small number of patients, these differences are statistically significant by the conventional chi square method. The percentage of patients relieved in this group by saline and morphine compares closely with the data in a much larger series reported previously[3] (viz: 21% for saline and 76% for morphine). In this study, the percentage of patients relieved by morphine is probably a low estimate, since it was given primarily to patients not relieved by saline or procaine.

This degree of analgesia from procaine was achieved at the cost of tremendous side-action liability, mainly unpleasant. Although one death has been reported from intravenous procaine given for the pain of arthritis[9] and severe sudden hypotension refractory to the usual methods of therapy has been reported from the use of large doses,[10] most observers have minimized the potential dangers of this drug. The authors believe that the extreme anxiety and apprehension, the dyspnea, the tachycardia (to 150 per minute), the disorientation, and the violent vomiting experienced by some patients is alarming. In six patients, the administration of procaine had to be stopped because of the magnitude of the side-actions. Patients have begged to have the infusion stopped because of the unpleasantness, and some have wept when anticipating a repetition ("I would rather have the pain."), but an equal number have enjoyed its effects.

Perhaps the doses used were excessive and, therefore, the side-actions were excessively frequent and severe. However, the low analgesia attained even with these doses and the possibility of such side-actions with small excesses in dose do not enhance the usefulness of this drug. Obviously, it is not a substitute for morphine. In addition, there is a very large variation in individual susceptibility to toxic effects of procaine. The authors have produced generalized clonic convulsions by injecting 75 mg. intravenously over a 4-minute period and have also given 800 mg. over a 20-minute period (160 mg. per 4 minutes) with dizziness alone resulting.

The rapid administration of large volumes of fluid necessary for this therapy complicates postoperative fluid balance, especially in patients having abdominal surgery and those with heart disease. The use of more concentrated solutions decreases the safety and controllability of the procedure. Very slow administration has little effect because of the rapid hydrolysis of procaine in the blood stream. Because of the rapid fluid administration, the large variation in susceptibility to toxic effects, and the possibility of serious side-actions, physician attendance is mandatory, prohibiting routine use of this therapy. These poor results have been reported by only one other observer.[9]

CONCLUSIONS

Saline, procaine, and morphine were given intravenously to the same 53 postoperative patients for treatment of pain. Saline relieved 20% of this group, procaine 40%, and morphine 70%. The degree of relief produced by procaine approximates that produced by 90 mg. of pentobarbital sodium.

The analgesia produced by intravenous procaine was accompanied by frequent unpleasant and sometimes serious side-actions. Unless procaine, administered by this route, can be demonstrated to produce significant beneficial effects on specific disease-processes, it has no place in the treatment of pain.

VOTING PRIVILEGES

A recent editorial in the *Los Angeles Mirror* reveals the apathy shown by too many citizens of this country when elections are held. According to this newspaper, less than 50 per cent of qualified United States voters exercise their privilege of voting in national elections. In Los Angeles the voting rate is between 20 and 35 per cent, which offers a dismal showing when compared to Great Britain, where national elections are said to bring out 85 per cent of the voters. However, Los Angeles is not unique. Other cities are as delinquent in this respect.

Dallas, Texas, newspapers several weeks ago carried information on the response of the voting public in that city. According to the Dallas County Poll Tax Committee, only 26 per cent of the members of the seven leading Dallas professional groups voted in the last Presidential election. The *Dallas Times Herald* and the *Dallas Morning News* justifiably drew attention to the findings of the Poll Tax Committee. According to information supplied in these newspapers, the heaviest vote among professional groups was found in the legal profession, but even in this group only 38 per cent of the lawyers voted in 1948. The poorest showing made by professional groups was in the nursing profession, in which only 12 per cent voted. In the medical profession, 36 per cent of the physicians voted. According to the *Dallas Morning News*, "it is the doctor, the lawyer, the engineer who bemoan the threat of socialism and burdensome debts. The doctor who fears socialized medicine and does nothing at the polls to combat it is legion. The Dallas poll merely proves locally a national picture that is pitiable.

"The result is a government of pressure groups alert to step in where others fail to tread.

"Polls similar to that in Dallas show 85 per cent of labor union membership votes. The figure is 90 for those who hold government jobs. Not only do they vote, they influence others. This is their civic privilege; we might even say duty, though it is a duty with a motive.

"Socialism can easily come to this country without a vote of the people. It can come by default."

When the figures for voters are finally compiled for 1950 it probably will be found that the professional groups, particularly physicians, now show a much greater interest in voting, and the precentage of voters in these groups should in general be much higher. It certainly can be said without fear of contradiction that in the country at large there has been sharply increased interest in registering and voting on the part of the medical profession. However, there is still room for improvement, and all physicians, as well as other members of professional groups, and especially those concerned with health, should recognize their obligations as citizens in these critical times.

According to the *Los Angeles Mirror*, Boy Scouts, as a civic duty, will try to induce more citizens to vote in the 1952 elections by ringing doorbells and reminding citizens that they should go to the pools. Facetiously, the *Mirror* says, "We wish the Scouts well in their efforts to stir up a little civic conscience in our slackers, but we've got a better idea. Maybe we should think about letting the Scouts vote."

We wish the Boy Scouts well in their attempts in 1952 to induce more citizens to vote in the elections. The work would be easier, however, for the Scouts and all other groups with similar civic-minded ideas, if examples were set by professional groups who in meeting their responsibilities as citizens are fortunate in having advanced training that should put them in an advantageous position to recognize the leadership they can provide in civic activities. However, to do the best job, these persons will have to begin now to think about fully meeting their responsibilities as voters and citizens. They cannot afford to wait until the last minute, or once again apathy may result in figures as disgraceful as those reported for 1948, or, as has been said elsewhere, "Socialism can easily come to this country without a vote of the people. It can come by default."

MORE OSCAR EWING PROPAGANDA

It is not often that a letter is reproduced in its entirety in the editorial pages of THE JOURNAL; however, in view of the discussions that have arisen concerning Oscar R. Ewing's advocation of federal intervention in health activities, the readers of this periodical will be interested in the letter reproduced here. Its writer claims that "Each communication receives individual attention and thoughtful consideration," but it is obviously a form letter, with only the date and name of the recipient being typed.

FEDERAL SECURITY AGENCY
Washington
Zone 25

November 1, 1951

Dear Mr. H. . . . .:

This will acknowledge your recent communication concerning the Nation's health. Many comments are received by the President and by the Federal Security Agency which indicate wide interest in the President's health proposals, including national health insurance.

National health insurance is not, as some believe, a proposal for socialized medicine. Socialized medicine or State medicine is a system wherein medical personnel work for the Government. Under national health insurance, the freedom of choice of doctor and patient is retained. The personal relationship between a patient and his doctor would continue.

The voluntary health insurance plans now in existence do not and cannot provide adequate benefits at low cost to the large number of people who would be included under national health insurance.

vol.
219.
5
Intra

National health insurance would enable many more of us to get preventive care. It would lighten the burden of heavy medical costs during illness by spreading the costs over the years when we are well, working and earning. At present these costs accumulate when people are sick and least able to pay. We believe that national health insurance would result in better medical care for the Nation as a whole.

Each communication receives individual attention and thoughtful consideration by a staff which studies and suggests ways to improve the Nation's health. Because of the volume of mail, however, it is impossible to reply in a more personal way.

Thank you for your interest.

Sincerely yours,
(Signed) Oscar R. Ewing
Administrator

Enclosures
Mr. G— C. H—
—— Avenue
Jersey City, New Jersey

The name of the recipient of the above letter is not published but can be obtained on request. Otherwise, the letter is reproduced exactly as it was received by THE JOURNAL and speaks for itself. Although Mr. Ewing has been criticized repeatedly for using his office for propaganda purposes, his actions seem to reveal an amazing indifference to such criticism, especially when some of it it has come from members of Congress.

POSTMORTEM EXAMINATIONS ON AIR CRASH VICTIMS

According to a recent report deaths could be reduced if passengers traveled facing toward the rear of the plane. After postmortem examination of 28 victims of an air crash and fire, Teare [1] concludes that in 16 the immediate cause of death was acute flexion of the body over the safety belt. The causes of death included fractured skull (10), fractured cervical spine (1), subarachnoid hemorrhage (1), and injuries to the chest and upper part of the abdomen (16), the latter including ruptured descending thoracic aorta (8).

There was no measurable concentration of carbon monoxide in the blood of 23 victims. The other five, who had 20% or less carbon monoxide in the blood, did not reveal evidence of burns in the internal air passages. This suggests that all 28 were dead or deeply unconscious before the outbreak of fire and that the fate of the occupants would have been the same had no fire occurred.

There was a remarkable similarity of injuries to seven pairs of victims who probably were sitting together. The stewardess, who was in the tail of the aircraft, escaped death. Such observations support the belief that certain parts of aircraft are more dangerous than others when a plane crashes.

With advances in foam-protected fuel tanks the danger of fire in air crashes will diminish and, as indicated by the findings in this study, the hazard might be further lessened by having the passengers seated facing backward.

RELIABILITY OF INTERPRETATION OF CHEST X-RAY FILMS

Roentgenography of the chest has become established as an indispensable procedure in the diagnosis of thoracic disease because it so frequently reveals disease that otherwise would remain unsuspected. The clinical management and even the details of treatment in thoracic disease often are based on the interpretation of shadows observed in roentgenograms. Physicians may hesitate to question the reliability of this method of examination, although they realize well the fallibility of other diagnostic procedures that appear less mysterious to them. Shadows that appear on films must be interpreted in pathological terms. This factor of interpretation recently was subjected to critical inquiry in a careful study [1] that analyzes subjective errors of interpretation of chest x-ray films and contains information significant to all physicians.

The project involved the recording of opinions by six experienced observers, three of whom were radiologists and three of whom were internists, regarding the stability of lesions of pulmonary tuberculosis as recorded on single roentgenograms (posterior-anterior projections) taken at intervals of three months. Each observer independently reported his opinion of each pair of films and subsequently reexamined the same series of films without reference to his original interpretation. The data thus recorded were analyzed by competent biostatisticians who were able to measure the inconsistencies of interpretation and relate the scores of each reader with the others and with his own previous opinions.

The results will surprise any persons who have deep faith in the reliability of roentgenographic methods of examination in thoracic disease. It was revealed that a second observer will disagree with the first observer in about one-third of all instances and, what is more surprising, when the same observer reviews the same film a second time after an appropriately long interval, he will find disagreement between his two opinions in about one-fifth of cases studied.

These results in no way decrease the recognized necessity of roentgenographic examination of the chest, but they do emphasize the fact, long known to many physicians experienced in thoracic disease, that clinical management of thoracic disease must be based on many types of clinical and laboratory data and not on roentgenography alone. Furthermore, the single posterior-anterior chest film frequently does not constitute complete roentgenologic examination, for fluoroscopy, stereoscopy, tomography, and specially projected views may add materially to the accuracy of the examination in special circumstances. There is no substitute for the true clinician, whose difficult task involves synthesis of different types of evidence in formulating his program of management for the patient. In dealing with thoracic disease, the physician must rely heavily on roentgenography, but he should realize that the opinion of the dynamic status of pulmonary tuberculosis would be reversed frequently if a second expert viewed the films or even if the same observer should submit a second opinion after he has forgotten the first report. Anyone who doubts this statement should subject it to adequate test.

PROLONGED CLOTTING TIME IN HIBERNATION

Svihla[1] and his associates of the Department of Zoology, University of Washington, Seattle, noted that, with a 23-gage hypodermic needle, heart blood can be safely drawn from active ground squirrels but that the same technique is usually fatal with dormant (estivating) squirrels. Necropsies showed that death was due to internal hemorrhages. These squirrels thus acted as if they were suffering from a clotting deficiency of the blood.

Studies of blood clotting were therefore made on active and dormant squirrels. By Howell's technique it was found that on an average the blood of nondormant squirrels coagulates firmly in about eight minutes. The blood of a dormant squirrel requires on an average 49 minutes to form a partial clot, a firm clot never forming.

Svihla believes that this prolongation of blood-clotting time is a purposeful adaptation for the dormant state. During this period the heart beats very slowly, with a marked decrease in the rate of blood flow. A mechanism that would tend to prevent thrombosis during this period would, therefore, be of great survival value to the animal. The factors involved in this prolongation of clotting time are being studied and may yield further information about the mechanism of blood clotting.

CONVERSION OF PALMITIC ACID TO GLUCOSE

The conversion of ingested carbohydrate into fat in animals and man is a commonly recognized and extremely useful phenomenon; the reverse reaction, on the other hand, had been debated for many years, and definite information regarding this transformation would be of great physiological significance. Using the long-lived radioactive isotope C^{14}, Strisower, Chaikoff and Weinman[1] have studied the conversion of the long chain palmitic acid into glucose by rats rendered diabetic with alloxan.The fatty acid used in these studies was labeled in either the 1 or the 6 position and was converted into the neutral fat tripalmitin before testing.

Two types of studies were carried out to measure the conversion of the labeled fatty acid into glucose. One was based on the recovery of the radioactive carbon in the glucose excreted by the diabetic rats in 24 hours, whereas the second depended on the amount of radioactive carbon in the extracellular glucose one hour after the injection of an emulsion of the labeled tripalmitin. In the diabetic rats, 3 to 6% of the injected radioactive carbon was recovered in the urinary glucose. Earlier, it had been reported by this group that about one-half of the amount of glucose turned over in the alloxan diabetic rat is excreted in the urine.[2] Thus it was calculated that at least 6 to 12% of the injected radioactive carbon is incorporated into glucose in 24 hours. From 1.6 to 2.9% of the injected isotopic carbon was calculated to be present in the extracellular glucose in the case of the diabetic rat and only 0.5 to 0.9% in the normal animal.

While the contribution of fatty acid to glucose formation is less than 10% of the total glucose turned over per hour in the diabetic animal, it should be noted that the amount of C^{14} recovered in the glucose is more than half that found in the expired air in this one hour period. Thus, these recent studies show that, when compared to the oxidation of fatty acids to carbon dioxide, the conversion to glucose in the diabetic rat is a highly significant process.

ALTERATIONS OF SODIUM, POTASSIUM, AND CHLORIDE IN DISEASE

The fundamental importance of alterations in the ionic concentrations, particularly of sodium, potassium, and chloride, in various body fluids and tissues in pathologic conditions and concomitant changes in water balance have become well recognized. An excellent current review[1] summarizes recent developments in this general field. As the author points out, the past two decades have been characterized by the introduction of many improved physical and physicochemical procedures, such as the flame photometer and isotopic methods, which have greatly expanded and extended knowledge of ionic and fluid changes in disease. Among the problems under current extensive investigation by the newer techniques is that of the relation of the adrenal glands to ionic balance. Recent studies, the review states, appear to indicate that the primary effect of the "mineral" corticoid hormones of the adrenal is the regulation of the distribution of sodium, potassium, and chloride and water between *intracellular* and extracellular fluid compartments. An earlier view held that the primary effect of these hormones was on renal excretion. The possible effects of 11,17-oxysteroids, including cortisone, on electrolyte and water balance remain equivocal. Ionic alterations in states of dehydration have also been extensively studied during the past few years. While generalization is rather difficult, a loss of intracellular potassium appears to be a consistent finding in dehydration from a variety of causes. This observation has led to the use of potassium salts therapeutically in this condition.

Other situations in which changes in sodium, potassium, and chloride concentrations in body tissues and fluids are discussed by the reviewer include diabetes, neuromuscular disorders, renal disease, cardiovascular pathology, shock, surgical conditions, and fever. In each instance, profound ionic and water alterations may occur, and their correction may present a major therapeutic problem. In fact, it has been stated,[2] that the surgeon must be as much concerned in the surgical patient with physiological fluid replacement as with surgical technique. Certainly, recent advances have emphasized the importance of fluid and electrolyte balance in planning and evaluating modern therapy.

GOVERNMENT SERVICES

ARMY

Enlisted Aidmen to Train at Camp Pickett.—Army medical aidmen will be given basic and branch training in the future at Camp Pickett, Va., the Department of the Army announced November 16. Medical replacement training centers currently in operation at Brooke Army Medical Center, Fort Sam Houston, Texas, and Fort George G. Meade, Md., are to be inactivated. Staffs and facilities will be transferred to Camp Pickett. Approximately 1,450 members of the cadre and staff at Fort Meade and 650 from Brooke will be involved in the shift. Personnel now undergoing training at these installations will not be affected, but all new medical service recruits will be assigned to Camp Pickett. Medical service officers and enlisted technical personnel will continue to train at the Texas post. Camp Pickett can accommodate the increasing number of medical aidmen required by the expansion of the Army. A maximum of 8,000 men can be trained at one time by this consolidation.

The medical replacement training center course now includes 16 weeks of intensive field and classroom instruction in the fundamentals of being a soldier, together with specialized training in techniques of administering blood and plasma, drugs, or other emergency measures to the wounded on the battlefield.

AIR FORCE

National Air Council Award.—The National Air Council Award for outstanding achievement in aviation research and experiment was awarded to Maj. John P. Stapp, USAF (MC), by Secretary of Defense Robert A. Lovett at a recent ceremony in the Secretary's office in the Pentagon. The award is made annually to the members of the Air Force and of the Navy who, during the previous fiscal year, have contributed most in the field of aviation research and experiment. The award is not restricted to medical research, but this is the second time aeromedical research activities have been so honored. Maj. Vincent Mazza received the award in 1949 for his work in proving the feasibility of using the ejection seat at high speeds. The Navy recipient of the NAC award for 1951 is Capt. Walter S. Diel, for his work in organizing and directing the Navy's transonic flight program.

The citation outlines Major Stapp's achievement in aviation medical research: the obtaining of data on deceleration forces encountered in aircraft crashes. To determine how much impact a pilot wearing safety harness could withstand and still survive, Major Stapp subjected himself to extreme physical forces while riding a specially constructed rocket-propelled decelerator sled during a series of tests. In performing the tests his normal body weight was increased as much as 45 times in some instances. This is equivalent to a force of nearly four tons. As a result of these tests, Major Stapp has produced valuable data pertinent to future designs of aircraft and safety devices.

Representation at Medical Meetings.—As part of the program to keep Air Force medical practice completely up-to-date, representatives of the Air Force are sent to outstanding medical meetings over the country. Col. Fratis L. Duff, chief of the Preventive Medicine Division for the Air Force Surgeon General, recently attended a three-day symposium on rheumatic fever sponsored by the Minnesota Heart Association at the University of Minnesota. Included in the program was a report on epidemiological studies conducted by the armed forces as well as recent developments in the theory of rheumatic fever. Colonel Duff also attended a recent conference on health and safety in aviation sponsored by the Harvard School of Public Health. The first part of the program was devoted to prevention of human failure in flight, and round table discussions on health maintenance with special reference to coronary heart disease, hypotension, and diabetes. There were also reports on recent advances in study of the disfunctioning of the adrenal cortex resulting from stress situations, respiratory, and circulatory failures. The remainder of the program was devoted to public health and aviation, modern trends in air transportation, equipment design, jet propulsion, and high speed aircraft.

Pathologists Attend Washington Seminar.—Nine U. S. Air Force pathologists attended a special indoctrination course at the Armed Forces Institute of Pathology in November. The course provided guidance on pathological procedure as applied to the Air Force. The seminar was conducted by Col. R. M. Thompson, deputy director of the institute, under the direction of Brig. Gen. Elbert DeCoursey, institute head. Attending were Maj. George J. Heid, stationed at Wright-Patterson Air Force Base, Ohio; 1st Lt. George W. Knabe Jr., Lackland Air Force Base, Texas; 1st Lt. Harold F. Knight, Sampson Air Force Base, N. Y.; 1st Lt. Michael J. Lyons, Maxwell Air Force Base, Ala.; 1st Lt. Albert Nemez, Langley Air Force Base, Va.; 1st Lt. Stanley R. Opler, Westover Air Force Base, Mass.; 1st Lt. Henry E. Pure, Lackland Air Force Base, Texas; and 1st Lt. Clarence Robinson Jr., Francis E. Warren Air Force Base, Wyo.

Combine Medical Research and Human Resources Division.—A newly formed Aeromedical and Human Resources Division has been established in the office of Air Force Deputy Chief of Staff for Development. The new division has been created by combining the research and development missions of the former Medical Research Division of the Office of the Surgeon General, USAF, with the former Human Resources Division of the Directorate of Research and Development. The combined division maintains staff cognizance over medical and human resources research and development programs for the Air Force. Individual branches include aviation medicine, human engineering and training, personnel and manpower, and human relations. Heading the new division is Col. A. P. Gagge, formerly chief of the medical research division. Alfred H. Lawton, M.D., is medical research advisor and Glen Finch, Ph.D., is human resources research advisor.

New Chief for Medical Consultants Division.—Col. Oscar S. Reeder, USAF (MC), has assumed duties as chief of the Medical Consultants Division for the Office of Air Force Surgeon General. As head of this division, he will evaluate, plan, and administer the professional aspects of the prophylaxis, diagnosis, and treatment of the sick and injured. The division further assists and advises the Surgeon General in all matters pertaining to the professional care of patients. The organization and programs of Air Force medical installations and the quality, numbers, distribution, and assignment of medical specialists are also supervised by this division. Colonel Reeder replaces Col. John F. Dominick, who has been assigned to headquarters, U. S. Air Force in Europe, for duty as chief of the Professional Services Division.

Personal.—Dr. Louis H. Bauer, president-elect of the American Medical Association, was recently designated chairman of the semiannual National Consultants Conference convened by the Air Force Surgeon General.

VETERANS ADMINISTRATION

Residencies in Psychiatry Available.—Residencies in psychiatry are available at the Veterans Administration Hospital, Hines, Ill., beginning January 1, 1952, for a three year period. The residency program is under the direction of the Department of Psychiatry, University of Illinois. The program of lectures, conferences, and seminars at Hines is coupled with rotation for special services in Chicago. The training is fully accredited by the American Board of Psychiatry and Neurology. The hospital is within commuting distance of all other psychiatric facilities in the Chicago area.

ORGANIZATION SECTION

SCIENTIFIC EXHIBIT—CHICAGO SESSION

Several special features will be presented in the Scientific Exhibit at the Chicago Session, according to present plans.

Heart disease will be shown in several exhibits, with a question and answer conference in an adjoining area. The American Heart Association, the Illinois Heart Association, and the Chicago Heart Association are cooperating, with Louis N. Katz, M.D., Chicago, acting as chairman. The subject of diabetes will be presented by the American Diabetes Association, with several exhibits and a question and answer conference. Howard F. Root, M.D., Boston, is arranging the program.

An exhibit symposium on cancer is being arranged with the cooperation of the Illinois Division of the American Cancer Society. Various exhibits will cover different phases of the cancer problem. The exhibit symposium on overweight, nutrition, and health, which was shown at Atlantic City and Los Angeles, will be repeated in Chicago, with such changes as seem timely. A question and answer conference will be conducted in an adjoining area. James R. Wilson, M.D., Chicago, is arranging the program. The special exhibit on fractures will be continued, with demonstrations in six booths. Frederick A. Jostes, M.D., St. Louis, is chairman of the committee in charge.

The Section on Preventive and Industrial Medicine and Public Health will again feature an exhibit symposium on noise and health, with the cooperation of the Council on Physical Medicine and Rehabilitation and the Council on Industrial Health of the American Medical Association, the Committee on Conservation of Hearing of the American Academy of Ophthalmology and Otolaryngology, the Acoustical Society of America, and the Acoustical Materials Association. Howard A. Carter, Chicago, will be in charge.

The Section on Physical Medicine and Rehabilitation, with the cooperation of the American National Red Cross, the Council on Physical Medicine and Rehabilitation of the American Medical Association, and various other agencies, will present the essential features of artificial respiration. The back pressure-arm lift method will be demonstrated in the booth, and plans are under consideration for demonstrations in Lake Michigan, in a location adjoining Navy Pier. Carl J. Potthoff, M.D., Washington, D. C., is in charge of the program.

The Section on Urology will continue the discussion periods inaugurated last year, in which all the urological exhibits are discussed at certain hours of the day by competent urologists. Roger W. Barnes, M.D., Los Angeles, is chairman of the section exhibit committee.

Motion pictures will be shown continuously throughout the week in two motion picture theaters adjoining the Scientific Exhibit. The Committee on Medical Motion Pictures of the American Medical Association will preview all films submitted. It is expected that an outstanding program will be arranged.

Each of the 19 Sections of the Scientific Assembly will sponsor a group of exhibits dealing with its particular specialty in medicine. Application blanks for space in the Scientific Exhibit and for time on the motion picture program may be obtained from the Director, Scientific Exhibit, American Medical Association, 535 North Dearborn Street, Chicago 10, Ill. Applications close on Jan. 15, 1952.

Portable Exhibits

A new style of exhibit is being developed by the Association's Bureau of Exhibits to fill a need for attractive portable exhibits. The weight of these units is 40 to 60 lb. each, and they are small enough to be placed in the rear seat of an automobile and taken to such group sessions as those of the Parent Teachers Association, women's clubs, and school science classes.

The exhibit on "School Health Services" is now available and a portable exhibit on "Home Accidents" is under construction, as well as a unit dealing with the subject of appendicitis. The portable exhibit on appendicitis will be available on both a loan and a purchase basis. The Association has assumed all the creative cost and the cost of the initial unit. The state and county medical societies may obtain different units at a marked saving. Each portable exhibit on appendicitis will be provided with a shipping case. The units will cost $285 each.

Animals in Research

A new exhibit on "Animals in Research" has been developed by cooperation with representatives from the National Society for Medical Research, veterinary groups, and the Bureau of Exhibits.

The positive gains obtained through the use of animals in research is depicted in the exhibit, which emphasizes the benefits accruing to farm animals and household pets, as well as the benefits obtained by humans through animals in research. The need for continued research is set forth in one portion of the exhibit entitled "The Benefits of the Future."

A continuous projector is included in the central portion of the exhibit devoted to a series of slides entitled "Thanks to Animals." Here is shown the part that has been played by animals in the treatment of obesity, the development of the iron lung, the "blue baby" operation, bronchoscopy, vaccination for smallpox, immunization for diphtheria, the benefits of the sulfonamides, and the treatment of burns. This exhibit is available to state and county medical societies on a loan basis without charge. The only cost involved is the transportation of the exhibit.

LIBRARY LENDING SERVICE

Beginning Jan. 1, 1952, the A. M. A. Library will offer its Periodical Lending and Package Library Services free to the members of the American Medical Association. Members of the Student American Medical Association are also eligible for the same service, but their requests must bear the signature of a faculty council member. Hereafter, the fee to nonmembers will be 50 cents for each package library and 15 cents for each periodical borrowed.

MEDICAL NEWS

CONNECTICUT

Congenital Heart Disease Clinic.—A clinic for "blue babies" and other children with congenital heart malformations amenable to surgery has been opened at the Grace-New Haven Community Hospital by the Children's Bureau with the cooperation of the state health department. This is the first of such centers that the Children's Bureau plans to set up in its expansion program of financial assistance to states for this purpose. Beginning this fiscal year the Children's Bureau intends to allocate $100,000 annually for this activity. Surgical and hospital care and related services will cost an average of about $1,000 for each baby treated, according to the bureau. It is reported that 7,335 infants died in 1948 of congenital malformations of the cardiovascular system.

DELAWARE

Society News.—At the December meeting of the Delaware Academy of General Practice in Wilmington, Dr. Robert B. Greenblatt, professor of endocrinology at the Medical College of Georgia, Augusta, spoke on "The Sexual Attributes and Potential of Man—An Endocrine Study." The following officers, all of Wilmington, were elected for 1952: Dr. J. Jesse Selinkoff, president; Dr. Arthur J. Heather, vice-president; Dr. Marjorie E. Conrad, secretary, and Dr. Harry Taylor, treasurer.

GEORGIA

Society News.—At the November meeting of the Atlanta Eye, Ear, Nose, and Throat Society the following officers were elected for 1952: Dr. Ferdinand Calhoun Jr., president; Dr. William C. Hathcock, vice-president, and Dr. James T. King, reelected secretary-treasurer.

Symposium on Alcoholism.—The Georgia Commission on Alcoholism will hold a symposium on alcoholism in the Atlanta Municipal Auditorium on January 18. Out-of-state speakers on the program include three from New Haven, Conn.: Raymond G. McCarthy, M.A., executive director, Yale (University) Plan Clinic; Leon A. Greenberg, Ph.D., assistant director, Laboratory of Applied Physiology, Yale, and Ralph M. Henderson, LL.B., Section of Alcohol Studies, Yale. The fourth speaker is Dr. Ebbe C. Hoff, Richmond, medical director, Virginia Program on Alcoholism.

ILLINOIS

Report on Communicable Diseases.—The number of Illinois deaths caused by 6 of 10 major communicable diseases decreased during the first half of the year as compared to the similar period in 1950, the state department of public health announced December 5. The greatest decrease was reported in deaths from all forms of tuberculosis, which dropped from 1,116 during the first half of 1950 to 936 the first six months this year. For pulmonary tuberculosis alone, deaths dropped from 1,029 to 895. Whooping cough fatalities decreased from 20 to 7, influenza deaths from 94 to 83, and meningitis deaths from 28 to 25. No death was reported as a result of diphtheria in the first six months this year as against two for the same period last year. Poliomyelitis, which resulted in nine fatalities in the first half of 1950, caused six deaths this year. Measles, however, caused 26 deaths this year compared to 4 last year. Pneumonia deaths increased from 1,253 to 1,360, encephalitis deaths from 5 to 15, and syphilis fatalities from 226 to 254.

Chicago

Society News.—The North Side Branch of the Chicago Medical Society will hear Dr. John M. Waugh, head of the section in general surgery, Mayo Clinic, Rochester, Minn., speak January 3 on "Sphincter Conservation in the Management of Carcinoma of the Rectum." The meeting will be held at the Drake Hotel at 8 p. m. Dr. Paul H. Holinger, professor of bronchoesophagology, University of Illinois, will also speak on "Management of the Patient with Hoarseness."

Joint Meeting on January 16.—The Chicago Medical Society and the Institute of Medicine will meet jointly January 16 at 8 p. m. in the John B. Murphy Auditorium. Dr. Marion A. Blankenhorn, director of the department of internal medicine at Cincinnati General Hospital, will speak on "Pneumonia in the General Hospital—Present Day Problems." The second speaker will be Dr. Carl V. Moore, professor of medicine at the Washington University School of Medicine, St. Louis, who will discuss "Recent Advances in Management of Blood Dyscrasias."

MARYLAND

Symposium on the Physician in Court.—A discussion of the physician in court was presented in Baltimore December 7. Expert testimony was given from the viewpoint of trial counsel, industrial medicine, traumatic surgery, psychiatry, and the jurist. Speakers were Robert E. Coughlan Jr., member of the Baltimore City Bar Association; Dr. Thomas C. Wolff, associate professor of medicine at the University of Maryland, Baltimore; Dr. George O. Eaton, assistant professor of orthopedic surgery at Johns Hopkins University School of Medicine, Baltimore; Dr. Manfred S. Guttmacher, medical officer, Supreme Bench of Baltimore, and the Hon. W. Conwell Smith, chief judge, Supreme Bench of Baltimore. The program was arranged by the Joint Committee on Medicolegal Problems of the Baltimore City Bar Association and the Medical and Chirurgical Faculty of the State of Maryland.

MASSACHUSETTS

Tufts Medical Alumni Lecture.—The annual medical alumni lecture will be given January 10 at 11 a. m. at Tufts College Medical School by Dr. Jesse E. Edwards, consulting physician, Mayo Clinic, Rochester, Minn. His subject will be "Advances in Pathology of Cardiovascular Diseases." This lecture is given annually by a distinguished alumnus of Tufts College Medical School who is not on its faculty. Physicians and students are invited to attend.

MINNESOTA

Course in Clinical Neurology.—Dr. Harold G. Wolff, professor of medicine and associate professor of psychiatry at Cornell University Medical College, New York, will give the annual J. B. Johnston Lecture at 8:15 p. m. January 30. His subject will be "On the Nature of Pain." He will also participate in a continuation course for physicians in clinical neurology that will be presented at the Center for Continuation Study January 28-February 9, 1952. Other visiting faculty members for the course include Dr. Benjamin Boshes, Evanston, Ill.; Dr. H. Houston Merritt, New York, and Dr. Henry G. Schwartz, St. Louis. Dr. A. B. Baker, professor and head of the division of neurology, is chairman for the course and will be joined by members of the faculty of the University of Minnesota Medical School and the Mayo Foundation.

MISSISSIPPI

State Secretary Ends 30 Years in Office.—Dr. Tom Dye, Clarksdale, resigned December 1 as secretary of the Mississippi State Medical Association, a position he had held continuously for more than three decades. Dr. George E. Twente, Jackson, has been appointed to fill the unexpired term of office. After graduation from Tulane University, Dr. Dye practiced successively in Florence, Sherard, and Longwood before establishing his residence at Clarksdale. In 1909 he was elected first district councilor of the Mississippi State Medical Association and served seven years in this office until his election as president in 1916.

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

MISSOURI

Society Election.—At the annual meeting of the Kansas City Southwest Clinical Society November 28, the following officers were elected: Dr. John A. Growdon, Kansas City, president; Dr. Hubert M. Parker, Kansas City, president-elect; Dr. Galen M. Tice, Kansas City, Kan., secretary; Dr. E. Kip Robinson, Kansas City, treasurer, and Dr. Maurice J. Ryan, Kansas City, Kan., director of clinics.

Study Club Program.—The following programs for 1952 have been arranged by the General Practitioners Study Club of Greater St. Louis. All speakers are from St. Louis.

January 16, Robert E. Ryan, Headache—Migraine and Its Differential Diagnosis and Treatment.
February 20, Roland M. Klemme, New Methods of Diagnosis in Neurosurgery.
March 19, Joseph Grindon, Discussion of the Common Skin Diseases and Their Treatment.
April 16, John A. Virant, Ear, Nose, and Throat Problems of Interest to the General Practitioner.

NEW YORK

Staff Journal Club.—This group, formed with the cooperation of the Medical Society of the County of Wyoming, meets once a month to promote understanding between specialists on local hospital staffs and general practitioners in the county. Meetings are held at the home of one of the doctors, with all members of the county medical society invited to attend.

Congenital Heart Disease Clinic.—The University of Rochester School of Medicine and Dentistry has expanded and coordinated its study of congenital heart disease into a regular clinic facility. The clinic is a joint project of the departments of radiology, medicine, surgery, and pediatrics under the direction of Dr. George H. Ramsey, professor of radiology. Provision is being made for clinic, division, and private patients.

Academy Desires Research Papers.—The New York Academy of Medicine is seeking research papers by investigators in New York and neighboring cities within a radius of 100 miles to be presented at evening meetings April 23 and 24. The presentations must be the results of original research in clinical medicine or surgery. Preference will be given papers that have not been presented before a national or local society (other than intramural). An abstract of the proposed presentation in quadruplicate, not to exceed 500 words, should be sent to the secretary of the Committee on Medical Education of the academy, 2 East 103rd St., New York 29, not later than February 15. A formal invitation to participate will then be extended by the committee.

New York City

Pollitzer Lecture.—The department of dermatology and syphilology of the New York University Post-Graduate Medical School announces that the second Sigmund Pollitzer Lecture will be given by Dr. Jerome W. Conn on February 1 at 4 p. m. in the Main Lecture Hall of the College of Medicine. Dr. Conn is professor of internal medicine at the University of Michigan Medical School, Ann Arbor, and chief of the division of endocrinology and metabolism at University Hospital. The title of his lecture will be "The Influence of Adrenal Cortical Activity on the Electrolyte Composition of Thermal Sweat."

Hospital Superintendent Joins Veterans Administration.—Dr. Alexander W. Kruger, general medical superintendent of the city's department of hospitals, resigned November 30 to join the department of medicine and surgery of the Veterans Administration in Washington, D. C., the *New York Times* reported. Dr. Kruger has been associated with the department of hospitals since 1934 when he became executive physician at Morrisania City Hospital in the Bronx. As general medical superintendent he had charge of the administration of the eleven municipal hospitals in the Bronx, Brooklyn, and Queens.

NORTH CAROLINA

Dedicate Industrial Medical Center.—Dedication of the medical center of the Ecusta Paper Corporation, a subsidiary of Olin Industries, Inc., of Pisgah Forest, was held November 9. Guests of honor included Dr. Charles L. Newland, Brevard, president, Transylvania County Medical Society, and several society members, and the following visitors: Dr. Edward C. Holmblad, Chicago; Dr. George H. Gehrmann, Wilmington, Del.; Dr. Walter R. Berryhill, Chapel Hill; Haywood M. Taylor, Ph.D., Durham, and Dr. George T. Harrell, Winston-Salem.

TEXAS

Dedicate Experimental Science Building.—Detlev W. Bronk, Ph.D., president of Johns Hopkins University, was the speaker at the dedication of the experimental science building of the University of Texas, Austin, on December 7. The new building will house the biochemistry institute and the department of zoology of the university. The Texas Branch of the Society of American Bacteriologists and the Texas Academy of Science held their annual meeting in connection with the dedication ceremonies.

Scholarship in Preventive Medicine.—Following the recent death of Dr. Joseph B. Kass, Detroit, of the class of 1913 at the University of Texas Medical School, Galveston, it was learned that he had made provision for the endowment of a research scholarship in preventive medicine. This scholarship had been maintained by Dr. Kass since 1922. It was established for the encouragement of research in preventive medicine, and is awarded annually to a medical student by a special committee.

WEST VIRGINIA

Diabetes Committee Discharged.—The West Virginia State Medical Association's committee on diabetes has been officially discharged by the council with thanks expressed by the council members for the work done since the committee was created months ago. It was agreed that if the committee were kept alive, there would be considerable overlapping of activities with the state diabetes association.

Annual Pilgrim Meet.—The annual "Pilgrim Meet" of the West Virginia Obstetrical and Gynecological Society was held in Columbus, Ohio, November 10. Those present attended operative clinics at the new Ohio State University Hospital in the morning, and the program was devoted to didactic lectures in the afternoon. Dr. Allan C. Barnes, chairman, department of obstetrics and gynecology, Ohio State University College of Medicine, Columbus, was host at a cocktail party at his home preceding the banquet. The "Pilgrim Meet" is an annual affair organized by the late Dr. Harry G. Steele of Bluefield and is usually held during the winter months.

GENERAL

President of Rockefeller Foundation.—Dean Rusk, Assistant Secretary of State for Far Eastern Affairs, has been invited to become president of the Rockefeller Foundation on the retirement of Chester I. Barnard, when Mr. Barnard reaches the age limit June 30. Mr. Rusk has been a trustee of the foundation since April, 1950.

Clinic Administrators Meeting.—The American College of Clinic Administrators will meet January 13-15 at the Conrad Hilton Hotel, Chicago, under the presidency of Dr. Robert J. Wilkinson Jr., Huntington, W. Va. Eight papers will be presented. At the banquet January 14 the Hon. Rush D. Holt, Weston, W. Va., former U. S. senator from West Virginia, will speak on "Fable of the Free Lunch."

Meetings on Surgery of the Hand.—The American Society for Surgery of the Hand will hold its annual meeting January 25 at the Palmer House, Chicago, under the presidency of Dr. Michael L. Mason, Chicago. The following will speak by invitation:

J. Leonard Goldner, Durham, N. C., Deformities of the Hand Incident to Pathology of the Extensor and Intrinsic Muscle Mechanisms.
Frederick L. Liebolt, New York, Luxation of the Distal Radioulnar Joint.
Carmelo C. Vitale, Brooklyn, Reconstructive Surgery for Ulnar Shaft Defects in Growing Children.
Frederick H. Vom Saal, New York, Intramedullary Fixation of the Hand and Fingers.

National Board of Examiners.—On December 1 Everett S. Elwood, executive secretary of the National Board of Medical Examiners since 1921, reached the retirement age. He has been succeeded by Dr. John P. Hubbard, Philadelphia, who was appointed associate secretary in 1950. Mr. Elwood will continue his association with the board as editor and consultant on state medical board relations. Dr. Hubbard, who is also professor of public health and preventive medicine at the University of Pennsylvania, has been working with the national board during the past 18 months, revising the examinations in accord with advances in medical education.

Society Elections.—Officers elected November 2 at the annual meeting of the Central Society for Clinical Research include: Dr. W. Barry Wood, Jr., St. Louis, president; Dr. George E. Burch, New Orleans, vice-president, and Dr. Kenneth G. Kohlstaedt, Indianapolis, secretary-treasurer.——Dr. Herbert C. Schenck, Atlanta, Ga., was elected president of the Southern Tuberculosis Conference at its fall meeting in Chattanooga, Tenn. He is director of the Tuberculosis Control Division, Georgia Department of Public Health. Other new officers are K. W. Grimley, executive secretary, Alabama Tuberculosis Association, vice-president, and Frank W. Webster, executive secretary, North Carolina Tuberculosis Association, secretary-treasurer. The Southern Trudeau Society, medical section of the conference meeting at the same time, elected Dr. James D. Murphy of Oteen, N. C., president. Dr. Murphy is chief of the surgical service, Veterans Administration Hospital, Oteen. Dr. David H. Waterman, Knoxville, Tenn., was elected vice-president, and Dr. Perry M. Huggin, Knoxville, was reelected secretary.

Report of Multiple Sclerosis Society.—The first annual report of the National Multiple Sclerosis Society records the results of the first five years of work by the society from October, 1946, when it was formed, to July, 1951. The society has grown to a national membership of over 19,000 with twelve chapters. It has raised $739,955. About 47 cents of each dollar spent by the society since its formation supported its 17 research projects. Although most projects deal with basic research, seven multiple sclerosis clinics have been established to provide centers where treatment that may be helpful can be evaluated and physiotherapy given where facilities permit. The research program covers such studies as allergy, myelin destruction, psychological factors, evaluation of corticotropin (ACTH), biochemical studies, and virus studies. Most of the society's financial support (70%) has come from patients, their relatives, and friends, and the remainder from charitable foundations. In the past year the society has published a medical manual for physicians aimed at keeping them posted on all current developments in the field, and a rehabilitation manual designed for physicians and physiotherapists.

College of Surgeons Section Meeting.—The American College of Surgeons will hold a section meeting January 10-12 at The Tutwiler in Birmingham, Ala. At the opening meeting Dr. Fred W. Rankin, clinical professor of surgery at the University of Louisville (Ky.) School of Medicine, will speak on "Carcinoma of the Gastrointestinal Tract." The program includes the following panel discussions and symposiums:

Hysterectomy: Total, Subtotal, or Vaginal, William N. Jones, Birmingham, moderator, with Louise H. Branscomb and Samuel Buford Word, both of Birmingham.
Intestinal Obstruction, Ira A. Ferguson, Atlanta, moderator, with Arthur I. Chenoweth, Birmingham; Walter G. Maddock, Chicago, and Marcus M. Ravitch, Baltimore.
Symposium on Trauma, Peter B. Wright, Augusta; James H. Semans, Atlanta, and Marcus M. Ravitch, Baltimore.
Symposium on Cancer, James Barrett Brown, St. Louis; Champ Lyons, Birmingham; R. Lee Clark Jr., and coauthor, George J. Ehni, both of Houston.
Breast Tumors, I. Mims Gage, New Orleans, moderator, with Joseph A. Cunningham, Birmingham; James Elliott Scarborough Jr., Atlanta, Ga., and Hoke Wammock, Augusta.
Bleeding from the Gastrointestinal Tract, Fred W. Rankin, moderator, with Ralph F. Bowers, Memphis; Joseph M. Donald, Birmingham, and David Henry Poer, Atlanta.

At the dinner meeting January 11 Dr. Paul R. Hawley, Chicago, director of the American College of Surgeons, will speak on "Your College: What It Means to You and to Me." A special program for otolaryngologists and ophthalmologists will be given on January 12. It includes a symposium on malignant exophthalmos by Drs. Arthur M. Freeman, Donald B. Sweeney, and Beamon S. Cooley Jr., Birmingham.

Venereal Diseases in Seven Cities.—The Statistical Service and the Social Hygiene Division of the New York Tuberculosis and Health Association published December 3 a tabulation on cases of syphilis and gonorrhea reported in seven leading American cities for 1941-1951 inclusive. The figures are based on reports to the United States Public Health Service by New York, Chicago, Philadelphia, Los Angeles, Detroit, Baltimore, and Cleveland. For each city there has been a definite decline in the number of cases of syphilis (all stages) reported between 1941 and 1951 and an increase in the total number of cases of gonorrhea reported for these cities in the same period. A similar trend of fewer cases of syphilis and more cases of gonorrhea was evidenced in the reports for the United States as a whole; 477,841 syphilis cases of all stages in 1941, and 231,567 for the year 1950. Cases of primary and secondary syphilis, which represent the categories that are contagious and of major public health interest, likewise declined in numbers. As to congenital syphilis, the trend is also downward. A total of 1,040 cases was reported in 1941 in New York City and 1,029 in 1942. By 1950 these reports dropped to 485 and to 510 in 1951. The other cities reported a similar or even larger decline. Gonorrhea cases reported for the entire United States reached a peak in the years 1946 (364,853) and in 1948 (363,014). In 1941 the total reported was 191,306, and in 1950, the last year for which a report is available, the total was 304,066.

Symposium on the Suprarenal Cortex.—The Colton Research Society and the University of Bristol will present a symposium on the suprarenal cortex March 31-April 4 in Bristol, England. The approximate cost will be £5. Guest speakers and their subjects are as follows:

Harry J. Robinson, Rahway, N. J., Role of the Adrenal Glands in Infection and Intoxication.
Hudson Hoagland, Ph.D., Shrewsbury, Mass., Adrenal Steroids and Personality Disorders.
Choh R. Li, Ph.D., Berkeley, Calif., Preparation and Assay of ACTH.
Dwight J. Ingle, Ph.D., Kalamazoo, Mich., Role of the Adrenal Cortex in Homeostasis.
George W Thorn, Boston, Clinical Applications of ACTH and Steroid Hormones.
F. Verzar, Basel, Switzerland, Nature of Adrenal Cortical Secretion.
Guy F. Marrian, F.R.S., Edinburgh, Metabolism of the Adrenocortical Steroids.
Solly Zuckerman, F.R.S., Birmingham, England, Suprarenal Cortex and the Gonads.
C. R. Broster, F.R.C.S., London, Surgery of the Suprarenal Gland with Especial Reference to the Cortex.
Gordon R. Cameron, F.R.S., London, ACTH, Steroid Hormones and Tissue Changes.
Marthe Vogt, Edinburgh, Control of the Secretory Activity of the Suprarenal Cortex with Special Reference to the Isolated Preparation.
C. J. O. R. Morris, London, ACTH Fractions and Their Mode of Action on the Suprarenal Cortex.
Frank G. Young, F.R.C.S., Cambridge, Physical and Chemical Properties of ACTH.

EXAMINATIONS AND LICENSURE

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination.* Montgomery, June 24-26, 1952. Sec., Dr. D. G. Gill, 537 Dexter Ave., Montgomery 4.

ARIZONA:* *Examination.* Phoenix, Jan. 19. *Reciprocity.* Phoenix, Jan. 15-17. Sec., Dr. J. H. Patterson, 316 W. McDowell Road, Phoenix.

ARKANSAS:* *Regular.* Little Rock, June 5-6. Sec., Dr. Joe Verser, Harrisburg. *Eclectic.* Little Rock, June 5-6. Sec., Dr. Frank C. Smith, 2301 Broadway, Little Rock.

CALIFORNIA: *Written.* Los Angeles, Feb. 18-21; San Francisco, June 23-26; Los Angeles, Aug. 18-21; Sacramento, Oct. 20-23. Application must be received at least two weeks prior to date of examination. *Oral for Reciprocity Applicants.* Los Angeles, Jan. 12; Los Angeles, Feb. 16; San Francisco, June 21; Los Angeles, Aug. 16; San Francisco, Nov. 8. Applicants are requested not to arrange to come to an oral examination until they receive notice from the Credentials Committee. *Oral and Clinical for Foreign Medical School Graduates.* Los Angeles, Feb. 17; San Francisco, June 22; Los Angeles, Aug. 17; San Francisco, Nov. 9. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

Board of Pediatrics; member of the American Academy of Pediatrics; served during World War I; for many years on the staff of Children's Hospital; died October 21, aged 57, of carcinoma of the larynx.

Kerr, Johnston Harper ⊕ Akron, Iowa; University of Nebraska College of Medicine, Omaha, 1904; served overseas during World War I; past president of the Plymouth County Medical Society and Sioux Valley Medical Association; on the visiting staff of Dakota Hospital in Vermillion, S. D., and Mercy Hospital in LeMars; owner and director of the Akron Hospital from 1920 to 1951; died in the Akron Community Hospital October 1, aged 75, of coronary occlusion.

Long, Frederick, San Francisco; University of California Medical School, San Francisco, 1910; member of the American Medical Association; member of the city board of health; died in Franklin Hospital October 19, aged 68, of cerebral hemorrhage.

Lyons, Harry Eugene ⊕ Erie, Pa.; University of Buffalo School of Medicine, 1909; served during World War I; for nine years a member of the city board of health; affiliated with St. Vincent's Hospital, where he died October 4, aged 67, of arteriosclerotic heart disease.

Morgenstern, James A., Easton, Pa.; College of Physicians and Surgeons, Baltimore, 1907; member of the American Medical Association; school examining physician; on the courtesy staff of Easton Hospital, where he died September 5, aged 70, of chronic myocarditis.

Morman, William Daniel ⊕ St. Louis; Howard University College of Medicine, Washington, D. C., 1929; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; instructor, department of otolaryngology, St. Louis University School of Medicine; affiliated with St. Mary's Infirmary, People's Hospital, and the Homer G. Phillips Hospital, where he died October 9, aged 49.

Parris, Briggs, *Geraldine, Ala.; University of Tennessee College* of Medicine, Memphis, 1913; member of the American Medical Association; died recently, aged 65, of a heart attack.

Reichelderfer, Vest Dresbach ⊕ Amanda, Ohio; Starling-Ohio Medical College, Columbus, 1913; served during World War I; affiliated with Lancaster-Fairfield County Joint Hospital in Lancaster, where he died September 28, aged 60, of coronary disease.

Rohm, Uriah Franklin, Carnegie, Pa.; Medico-Chirurgical College of Philadelphia, 1902; member of the American Medical Association; on the visiting staff of Western Pennsylvania Hospital in Pittsburgh; died November 3, aged 75, of coronary occlusion.

Savage, William Elliott, Portland, Ore.; Harvard Medical School, Boston, 1920; killed November 7, aged 58, in an automobile accident.

Schneider, Louis ⊕ Newark, N. J.; Medico-Chirurgical College of Philadelphia, 1908; past president of the Essex County Medical Society; on the staff of Presbyterian Hospital, where he died November 6, aged 67, of cerebral hemorrhage, arteriosclerosis, myocarditis and diabetes mellitus.

Schwerer, Herman Mayes ⊕ Canton, Ill.; University of Illinois College of Medicine, Chicago, 1934; past president of the Fulton County Medical Society; affiliated with Graham Hospital; died October 13, aged 44, of coronary thrombosis.

Seale, Enoch Carruth, Prescott, Ariz.; Vanderbilt University School of Medicine, Nashville, Tenn., 1916; mayor of Prescott; served during World War I; at one time associated with the U. S. Public Health Service Reserve, resigning from the U. S. Veterans Hospital in Whipple in 1923; died October 11, aged 63, of coronary disease.

Sheehan, Katharine Cecelia, Salem, Mass.; Tufts College Medical School, Boston, 1908; member of the American Medical Association; for many years school physician; died October 21, aged 78.

Shepler, Joseph Robert ⊕ Doylestown, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1935; served during World War II; died in Abington (Pa.) Memorial Hospital November 7, aged 43, of cerebral hemorrhage.

Simons, Irving ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1908; member of the American Urological Association; served during World War I; affiliated with Mount Sinai, Montefiore, and New York hospitals and the Hospital for Joint Diseases; died in Mount Vernon, N. Y., November 10, aged 67, of cerebral hemorrhage.

Smith, George Henry Jr., Brooklyn; Long Island College Hospital, Brooklyn, 1898; member of the American Medical Association; on the associate staff of Prospect Heights Hospital; died recently, aged 75, of heart disease.

Smith, Thomas Jefferson, Meridian, Miss.; Atlanta School of Medicine, 1911; died September 4, aged 66.

Stacey, John Wallace ⊕ Tucson, Ariz.; University of Manitoba Faculty of Medicine, Winnipeg, Man., Canada, 1925; member of the American College of Chest Physicians; served during World War II; died in St. Mary's Hospital November 11, aged 50, of brain tumor.

Stegner, Adam, Wyoming, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1892; died November 7, aged 82, of coronary thrombosis.

Stella, Giovanni ⊕ New Rochelle, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1906; died October 30, aged 66, of coronary thrombosis.

Stevenson, Alexander Montgomery, Atlantic City, N. J.; Jefferson Medical College of Philadelphia, 1895; died in Atlantic City Hospital October 24, aged 87, of intertrochanteric fracture of the right hip.

Stoever, Harry Von H., La Jolla, Calif.; University of Pennsylvania Department of Medicine, Philadelphia, 1891; died October 3, aged 82, of cerebral hemorrhage.

Strange, John William ⊕ Loogootee, Ind.; Medical College of Indiana, Indianapolis, 1903; served as county coroner and as mayor of Loogootee, for many years secretary of the county *board of health; affiliated with Daviess County Hospital* in Washington; in September, 1950, was chosen "General Practitioner of the Year" for the state of Indiana, by the Indiana State Medical Association; vice-president and a director of the Union Bank; died October 15, aged 75, of coronary occlusion.

Strawn, Estil Young, St. Joseph, Mo.; Howard University College of Medicine, Washington, D. C., 1913; served during World War I; died October 5, aged 64.

Sugg, Herbert Reid ⊕ Clinton, Iowa; Rush Medical College Chicago, 1896; past president of the Iowa State Department of Health; an Associate Fellow of the American Medical Association; died October 18, aged 77, of chronic myocarditis and hypertension.

Swart, Dennis S. ⊕ Portland, Ore.; University of Oregon Medical School, Portland, 1918; died October 31, aged 62, of a heart attack.

Talley, William Warren, New York; Medical College of Virginia, Richmond, 1887; College of Physicians and Surgeons, medical department of Columbia College, New York, 1888; formerly chief of the division of communicable diseases with the city health department; died in Richmond, Va., November 12, aged 87, of carcinoma of the lung.

Taylor, David Torrens, Abington, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1897; died October 27, aged 78, of coronary thrombosis.

Taylor, John Thomas, Cottonwood, Ariz.; Barnes Medical College, St. Louis, 1902; died in Prescott October 13, aged 74, of uremia.

Waddell, William Edgar ⊕ Lexington, Va.; University of Virginia Department of Medicine, Charlottesville, 1934; served during World War II and was awarded the Silver Star, Purple Heart, and Bronze Arrowhead; specialist certified by the American Board of Surgery; died October 7, aged 41, of bronchogenic carcinoma.

Weinstein, Henry, New York; Cornell University Medical College, New York, 1907; died in Lebanon Hospital July 18, aged 67, of coronary thrombosis.

FOREIGN LETTERS

ITALY

Meeting of Ionian Medical Society.—The Ionian Society of Physicians and Surgeons held a meeting in Taranto, at which Professor Natale discussed the tonsillectomy problem. He alluded to the functional prerogatives of the tonsil (hemodynamic, protective, and endocrine) and concluded that, despite the many difficulties that accompany surgical intervention, tonsillectomy remains a therapeutic method that has no substitute, especially when the lesion has become so chronic that the organ does not fulfill its functional requirements.

Professor Buonsanti, the chairman of the meeting, discussed major traumatic dislocations. His 17 years of experience in the City Hospital of Taranto led to the following observations.

1. Major traumatic dislocations, i. e., those involving the hip, the shoulder, and the elbow, represent only 1.16% of the traumatic lesions that he observed. Dislocations of the shoulder are the commonest (0.72%), followed by those of the elbow (0.33%); less numerous are those of the hip (0.11%).

2. Traumatic dislocations of the hip and of the elbow are determined by leverage, while that of the shoulder is determined by direct trauma.

3. A dislocation without complications presupposes conservation of the muscle tone; to its interplay of action and counterreaction is due the displacement of the head of the bone from the cavity in which it articulates.

4. Traumatic dislocations of the hip, in the cases observed, were predominant in infants, which conflicts with general statistics.

5. In the cases under observation there were no nervous or vascular complications.

6. The reduction of the dislocation should be performed gently, with inverse leverage, but also, when it is possible, as in superficial joints, one should aid with propulsion the return of the dislocated head of the bone. Every reduction should be performed with the patient under anesthesia, so that complete muscle relaxation is obtained.

7. Unless muscle tone has been abolished by violent trauma, a second dislocation is rare; therefore, caution against prompt use of the joint is unnecessary. The patient should use the joint when the pain has completely disappeared. Immobilizing bandages are not necessary and prevent the restoration of the natural muscle tone, which is very useful for the functional articular restoration.

Congenital Cardiopathy and Surgical Interventions.—Prof. Vittorio Puddu, *director of the rheumatism and heart disease center* at the University of Rome, lectured to the Filippo Pacini Medical Academy of Pistoia on clinical diagnosis of congenital cardiopathy with regard to surgical indications. The application of surgery in congenital heart disease, said the speaker, has made necessary for the general practitioner a more thorough cognizance of these morbid entities from the anatomic, physiopathological, and diagnostic points of view with regard to indications for surgical intervention. Some congenital heart diseases, for example, stenosis of the aortic isthmus, aortic stenosis at its onset, persistence of the ductus arteriosus, and Roger's disease (localized ventricular septal defect), present a relatively easy clinical diagnosis, because characteristic symptomatic factors are present. In these instances it is also easy to determine in each case whether an indication for surgical intervention is present. In other instances, and especially in forms of cyanosis, a diagnosis is difficult and often requires the use of special laboratory investigations, for example, cardiac catheterization, angiography, and oximetry. In many cases, however, a good clinical examination, supported by other investigations, such as determination of circulation time and the roentgenologic examination, helps to formulate an exact diagnosis or at least to establish whether a surgical intervention is feasible. Working in this way the practitioner will be very useful to the patient, especially to the one who lives far from specialized medical centers.

Congenital Familial Icterus.—At a meeting of the Medicosurgical Society of Pisa, held under the chairmanship of Professor Cassano, Dr. Conti and Dr. Luciani described a rare form of chronic familial icterus, characterized by hepatosplenomegaly, hyperbilirubinemia, increase of the hemoglobic catabolism, and hypercholesteremia. The disease occurred in the parents and two sons. The symptomatic picture was more pronounced in the mother and the sons, while in the father signs of liver and spleen disturbances were not observed, and only a high amount of cholesterol was present in the blood. The essentially hemolytic nature of the icteric picture in these patients was confirmed by all the clinical and laboratory data. Hypercholesteremia, observed in all the members of the family, was characterized by a high index of esterification and was typically constitutional, familial, and hereditary; it was neither of exogenous origin nor linked with an eventual dyshepatia.

According to the speakers, in these patients the hemolytic diathesis was associated with hypercholesteremic diathesis. Usually a syndrome of excessive escape of hemoglobin is associated with low levels of cholesterol in the circulating blood.

SWEDEN

Claims for Legal Induction of Abortion.—Since the second quarter of 1948, there has been an official organization in Stockholm for giving advice on sex problems to the public. Serving on this body are a gynecologist, a psychiatrist, two full-time curators or social workers, and a secretarial staff. One of the curators, Karin Malmfors, has recently undertaken a personal follow-up investigation of 200 women who applied to this organization for the purpose of seeking legal induction of abortion. These women represented a fair sample of the applicants, as consecutive, unselected cases were studied, with the exception of women in whom abortion was induced for eugenic reasons, who were not included in this study. Seventy per cent of the women were married, 21% were unmarried, and 7% were divorced, and 2% were widows. The married women were much older than the unmarried women. Sixty were persuaded to allow the pregnancy to go to term; 97 had legal abortions (being carried out only in 84 cases); 31 were refused abortion; 7 aborted spontaneously; and 5 resorted to criminal abortion.

As a part of this study, Karin Malmfors visited the women in their homes and discussed their reactions in a friendly, informal way. Although there were 39 (32 married and 7 living alone) who expressed satisfaction with the induction of abortion, there were 45 who suffered from a sense of guilt or deterioration of mental status. In the latter group, there were 10 women with symptoms of such disturbances as anxiety neuroses. In 75% of the patients, housing problems played a predominant role in the wish for the induction of abortion. Another significant result of this study was the disclosure of the high proportion of cases in which official consent for abortion either was not put into practice or was followed by regret and guilt. In her office work and during her conversations with women in their own homes, Karin Malmfors was frequently impressed by the slight value attached to human life by both the community as a whole and the individual. Weighing decisively in the balance between life and death may be such apparently trifling factors as warm clothing or a few weeks' rest for a worn-out mother.

The items in these letters are contributed by regular correspondents in the various foreign countries.

Sketches and Caricatures of Scandinavian Physicians.—Several years ago, the conglomerate Scandinavian medical journal *Nordisk Medicin* entertained its readers with a series of caricatures of well-known physicians in the Scandinavian countries. Most of these sketches were the work of Dr. M. Strandqvist and Dr. G. Østerberg, whose victims must have experienced mixed feelings on seeing themselves as others see them. They were for the most part well-known leaders of the medical profession, men of mature years. Many of them have gone into retirement and have been succeeded by a new generation of teachers and professors, who must now stand the acid test of caricature. The editors of *Nordisk Medicin* proposes to begin their new portrait gallery in 1952 with a series of sketches to appear on the last page of each issue.

COLOMBIA

Repression of Prostitution.—In Colombia, except in Bogotá, prostitution has been tolerated under regulation. Prostitution was suppressed in Bogotá in 1949, when municipal law No. 95 was enforced. It was recently stated that suppression of prostitution in Bogotá has resulted in an increase in sexual delinquency. The Society of Cultural Improvement and Social Work requested the opinion of the members of the National Academy of Medicine, and for several weeks a scientific committee discussed the subject. The conclusions of the committee were approved by the members of the academy, and were then given, in answer, to the Society of Social Work by Drs. Jorge Bejarano and Jorge E. Cavelier who represented the academy. The following conclusions were reached.

1. The National Academy of Medicine considers the municipal law repressing prostitution in Bogotá worthy of respect and of approval. 2. The members of the academy discussed the economic, social, and moral violations that prostitution constitutes and voted that the government should pass laws to repress prostitution throughout the country. 3. By reviewing the municipal law that repressed prostitution in Bogotá and the different systems that have been used through the years in all countries for controlling and regulating prostitution, the members found that repression of prostitution is the only measure to use against this evil. Repression is based on principles of hygiene and on social and Christian doctrines. The statements recently made by some persons about the bad results of repression are false, as shown by data reviewed by the academy. Bad results, if any, could be attributed only to the manner in which the law is applied. 5. The members of the academy believe that the municipal law No. 95 should be enforced by the local health authorities. This measure will prevent violation of the law, which should remain in force. 6. The members of the academy are requesting from the Ministry of Hygiene the creation and appointment of a permanent committee on the subject. This committee could prepare a law for repression of prostitution in the entire country. The function of this permanent committee would be to explain the principles and aims of the law whenever doubts or criticisms are expressed to the members. The permanent committee could carry on campaigns for the education of the people on sex problems and for control of venereal diseases, and should discover the causes of and the remedies for prostitution. 7. The members of the National Academy of Medicine cordially invite the national scientific societies, the press, the clergy, and the newspaper syndicates to support and cooperate with the government for the success of the campaign against prostitution. 8. In regard to prostitution, it is a great error for a nation to retain old systems that are conflicting with sanitation and with morality. The morality and health of the people is a responsibility of the government. Tolerance and regulation of prostitution by the government result in masking this social vice for the unscrupulous.

Institute of Legal Medicine.—Aug. 24, 1951, marked the third anniversary of the opening of this institute, which is among the best in South America. Dr. G. Uribe Cualla, professor of legal medicine in the Javeriana and the national universities and author of many books on the subject is the director. The Institute of Legal Medicine was created by the government as a center for consultation and decision on all medicolegal affairs in the country. It was created to replace the old Central Office of Legal Medicine. According to the laws, this institute is the central unity of all the national departments of legal medicine having also control on judicial matters and functions in cooperating with the teaching of legal medicine in the faculties of medicine and of law of the University of Bogotá. The 15 national departments of legal medicine with their personnel are dependencies of the institute, which has the following functions: To solve all medicolegal problems for all the departments of the country and to serve as consultant for the supreme court of claims as well as for judicial matters in the courts of Cundinamarca. The scientific personnel and other workers are selected by examination in accordance with the regulations of the ministry of justice. The cornerstone for the Institute of Legal Medicine was placed on June 12, 1943. The institute was opened on Aug. 24, 1948, coincidently with the celebration of the first National Congress of Legal Medicine. The institute provides, at the request of the judicial authorities, assistance and arbitration, such as intervention in cases of personal lesion, autopsy in cases of sudden death without medical certification, judgment in sex delinquency, abortion, age calculations, traffic accidents, industrial accidents (cases of controversy), and psychiatric examination of persons for placement in national asylums for the insane. A total number of 317,819 negotiations on legal medicine have been carried on by the proper departments in the last 15 years. The institute includes the following facilities: amphitheater of legal medicine (about 1,000 necropsies a year), laboratory of toxicology (200 analyses a year), forensic laboratory (2,500 analyses a year), laboratory of radiology (613 roentgenograms a year), and laboratory of pathologic anatomy (300 protocol studies a year). *Revista de Medicina Legal* is the organ of the institute. Publication started in 1935, and 62 issues have thus far been published. It includes the work carried on by the national societies of psychopathology, neurology, and legal medicine. Dr. G. Uribe Cualla is the president of the Colombian Society of Legal Medicine.

Congress of Otorhinolaryngology and Ophthalmology.—The second National Congress of Otorhinolaryngology and Ophthalmology convened in Medellín Aug. 8-11, 1951, under the chairmanship of Dr. C. J. Vásquez C. of Bogotá. The Congress was held under the auspices of the Faculty of Medicine of Medellín and the Academy of Medicine of Antioquia. Official speakers were as follows: C. Uribe Aguirre ("Tensional Relations Between Humeral and Central Retinal Arteries"), J. Suárez Hoyos ("Tonsillectomy and Its Indications in Children"), F. Arango Jaramillo ("Commentaries on Strabismus"), M. Barrientos ("Commentaries on Petromastoid Emptying"), A. Llano ("Technic of Pterigium"), H. García Gómez ("Commentaries on Clinical Cases of Cataract"), J. Arciniegas ("Focal Infection"), C. Vásquez C. ("Cancer of the Mouth"), H. Londoño Vélez ("Tuberculinotherapy"), P. E. Mendoza ("Some Cases of Cyclodiathermy"), A. Posada ("Analysis of Some Cases of Retinal Detachment"), H. Arellano Angel ("Experimental Surgery on the Cornea in Animals"), A. P. Rodríguez Pérez ("Functional Significance of Amacrine Cells"), C. Vásquez C. and A. P. Rodríguez Pérez ("Experimental Cataract: Histologic Study"), C. Vásquez, S. Castaño, and A. P. Rodríguez Pérez ("Biomicroscopy and Histologic Texture of the Vitreum"), A. Estrada ("Goniotomy"), and A. Sanchez ("Sympathectomy in Optic Atrophy").

Deaths.—Dr. Julio Zuluaga, dean of the Faculty of Medicine of Caldas City, died from cancer of the lung, on Oct. 1, 1951, in Manizales City. He was born in Salamina, obtained his medical degree from the Faculty of Medicine of the University of Colombia, and carried on postgraduate studies, in surgery, in the United States and France. He was the founder of the Society of Medicine and Surgery of Manizales and of a private clinic in the same city. The Department of Roentgenology in his clinic was the first established in the city. He established the charity departments in the Caldas Hospital and the sanatorium for tuberculous patients in that city. He was a deputy in the House of Representatives and head of the Municipalities of the cities of Caldas and of Manizales.

CORRESPONDENCE

PITUITARY DWARFISM

To the Editor:—The report in The Journal of Nov. 17, 1951, by James A. Greene, entitled "Pituitary Dwarfism," presented conclusions which must be considered controversial in the light of our present knowledge of growth mechanisms and the role of the pituitary gland. The growth-promoting properties of a "pituitary extract" (origin, potency, and other pertinent factors unstated) used in these studies have never before been duplicated in humans to my knowledge. Results in the treatment of dwarfism secondary to hypopituitarism with pure crystalline somatotropin have been uniformly discouraging. Lewis, Klein, and Wilkins (*J. Clin. Invest.* **29**:460 [April] 1950) failed to obtain growth, weight gain, nitrogen retention, or rise in serum inorganic phosphorus in a dwarf (probably panhypopituitary) and in a cretin but did note malaise, fever, anorexia, and negative nitrogen balance. Escamilla and Bennett (*J. Clin. Endocrinol.* **11**:221 [Feb.] 1951) obtained similar results in a pituitary dwarf.

In Dr. Greene's report there was no mention of a control period of observation prior to therapy. The rate of spontaneous growth was therefore unknown. There was no record in the case protocols of the weight, nutritional status, or dietary background of the 10 patients. Talbot and his co-workers (*New England J. Med.* **236**:783 [May 22] 1947) studied a group of dwarfed children in whom subnormal caloric intake was the primary etiologic factor, and several of these children exhibited a growth spurt when well fed. The only criterion for the diagnosis of pituitary dwarfism offered here was subnormal height and retarded bone age. Talbot has clearly demonstrated retardation of skeletal maturation of a degree equal to panhypopituitarism in his "nutritional dwarfs." It would be informative for Dr. Greene to document his protocols with more detail in an addendum to further substantiate the conclusions arrived at in this interesting paper. Finally, both thyroid and testosterone, agents with growth-promoting properties, were often used simultaneously with the pituitary extract. On the basis of the evidence offered in Dr. Greene's paper, one must reserve judgment both as to the diagnosis of dwarfism of pituitary origin and to the growth-promoting properties of the pituitary extract used.

Norman G. Schneeberg, M.D.
1834 Pine St., Philadelphia 3.

SIMPLE COMEDONE EXTRACTOR

To the Editor:—In 1946, after my return to the civilian practice of dermatology from military service, it was found that patients encountered difficulty in purchasing comedone extractors; those that were obtainable were inferior. At that time I was tempted, because of the scarcity of metal and the poor quality of the comedone extractors, to submit for publication a note suggesting the use of a substitute implement that could be used by the patient. It was simple, readily available, inexpensive, efficient, and superior to many types of comedone extractors that are sold in drug stores. The suggestion was not submitted because it was anticipated that better extractors would be made available. Five years have now elapsed, during which time the type and quality of the comedone extractors on the market have not improved. It appears that the new limitations set on the use of metals will impose further restrictions in the manufacture of better quality implements.

Where it has been necessary to recommend the removal of comedones by patients at home, I have suggested the use of an ordinary glass eyedropper of the straight narrow-tip variety. The end of the tip however, must be smooth and not sharply cut off as some are. The tip is placed directly over the blackhead, the glass permitting easy visibility in centering the comedone within the lumen of the tip, and pressure is exerted in the usual manner. The patient can readily see the comedone enter the lumen of the eyedropper thereby determining the amount of pressure to be exerted. Should the tip become plugged with expressed comedones, it is an easy matter to remove them by blowing out the collection from the wide end of the eyedropper.

I have found this simple instrument highly satisfactory. In my experience, less trauma has resulted from the use of the eyedropper than from the use of the cheap extractors, many of which have a sharp metallic rim around the hole, which frequently results in laceration of the skin.

Harold Shellow, M.D.
8 S. Michigan Ave., Chicago.

THORACENTESIS

To the Editor:—With reference to the article in The Journal (**146**:1597 [Aug. 25] 1951) entitled "Practical System for Thoracentesis Using a Blood Donor Set," by Dr. Robert D. Beech, of Salt Lake City, and to the letter concerning this article from Dr. W. B. Bergmann (**147**:990 [Nov. 3] 1951), in which he also claims priority for the procedure; I first used a vacuum bottle for thoracentesis about 35 years ago and had supposed the method to be in more or less general use. I had at that time in my office a particularly good suction pump for cleaning pipets. When this pump was attached to a 4-qt. bottle, sufficient vacuum was obtained to aspirate 3 qt. of fluid. I claim no priority for this procedure, as it was being used by others at that time at the University Hospital in Ann Arbor.

Mark Marshall, M.D.
918 Forest Ave., Ann Arbor, Mich.

To the Editor:—In The Journal of Nov. 3, 1951, Dr. W. B. Bergmann raises the question of priority in the use of a vacuum flask for the aspiration of pleural effusions and refers to "Practical System for Thoracentesis Using a Blood Donor Set," by Robert D. Beech (*J. A. M. A.* **146**:1597 [Aug. 25] 1951). This method was described and illustrated by us in 1946 (Penetrating Wounds of the Chest, *Ann. Surg.* **123**:363 [March] 1946). It is possible that a similar method had been described earlier, as our paper was written in the European Theater and we had little opportunity to check the current literature.

ANILINE POISONING

To the Editor:—I noticed in The Journal of Sept. 8, 1951, page 198, an abstract of an article entitled "Methemoglobinemia Due to Aniline," from the *Medical Journal of Australia.* You state that "this seems to be the first case in which such poisoning was produced by the pure chemical." On Sept. 27, 1949, I sent you a paper entitled "Acute Aniline Poisoning," in which a white man, 37, working as a laborer in an industrial plant, was poisoned by pure aniline oil which had leaked from a drum on the floor. You did not feel that the report warranted acceptance. In addition, there were electrocardiograms that reverted to normal; I have not been able to find in the literature any such report.

Samuel M. Jacobson, M.D.
50 Pershing St., Cumberland, Md.

GENERAL PRACTICE RESIDENCY

To the Editor:—We should like to call your attention to an error in the Sept. 29, 1951, issue of The Journal. On page 411, under item 7, which lists the general residencies approved by the Council on Medical Education and Hospitals, you indicate that R. D. McConchie is the chief of the general practice section in our hospital.

While we do have an approved general practice residency, we do not have at the present time a general practice section of our attending medical staff.

Thomas L. Norton, Administrator
Wichita General Hospital
Wichita Falls, Texas.

MEDICAL MOTION PICTURES

Tele-Clinic No. 3: 16 mm., black and white, sound, showing time 39 minutes. Produced in 1951 by and procurable on loan from Wyeth, Incorporated, Film Library, 1600 Arch St., Philadelphia 3.

This motion picture is a newsreel type coverage of the Thirty-Second Annual Session of the American College of Physicians, St. Louis, 1951.

The film begins with a view of the auditorium, a welcome address by the general chairman, and a statement of the objectives of the college by Dr. William S. Middleton, president. Abstracts of the following five papers are read by the authors: "Radiation Injury Following an A-Bomb Explosion," Lt. Col. C. F. Vorder Bruegge, M.C., U.S.A., Armed Forces Institute of Pathology; "Current Concepts of the Coagulation Mechanism," Dr. Kenneth N. Brinkhous, University of North Carolina School of Medicine; "Prevention of Rheumatic Fever," Dr. Charles H. Rammelkamp Jr., Western Reserve University School of Medicine; and "Iron Metabolism and the Therapy of Iron Deficiency States," Dr. Carl V. Moore, Washington University School of Medicine, and "A Biblical Introduction to Geriatric Medicine," Dr. Louis Krause, University of Maryland School of Medicine. Sequences of portions of the convocation are then shown. These include formal induction of newly elected fellows; presentation of a mastership to Dr. Ernest Irons; Sir John Parkinson of England being made an honorary fellow; presentation of the James D. Bruce Memorial Award to Dr. Rolla Dyer and the Alfred Stengel Memorial Award to Dr. George Morris Piersol; convocation address by Sir John Parkinson; and closing of the meeting by President Middleton.

This film would be of primary interest to members of the American College of Physicians. The photography and narration are satisfactory.

Extraperitoneal Caesarean Section: A Simplified Paravesical Technic: 16 mm., color, sound, showing time 17 minutes. Prepared by A. R. Abarbanel, M.D., College of Medical Evangelists and Temple Hospital, Los Angeles. Produced in 1951 by and procurable on loan, rental, or purchase from Motion Picture Division, Department of Theater Arts, University of California, Los Angeles.

This film demonstrates the relative ease and safety with which extraperitoneal cesarean section may be performed. It stresses the avoidance of trauma to the bladder and of entrance into the peritoneal cavity. The author's statements as to the indications for relative ease and safety in performing extraperitoneal cesarean section are acceptable; however, some of the modifications of previously utilized technics are not entirely new, nor do they present operative advantages over standard accepted technics. A broad downward curved incision is used because it facilitates exposure with less scar formation than the Y-shaped incision. The use of the modified Z incision in the uterus is open to question. It is stated that skin clips are of advantage; this is largely a choice of the individual operator, as interrupted sutures afford equal advantages in cases that are considered to be or are potentially infected. This film should lend itself well for presentation to medical society groups and for intern and student teaching. It is recommended for the purpose for which it is presented and is well organized from a production point of view. The photography and narration are excellent.

The Diagnosis of Surgical Lesions of the Alimentary Tract: 16 mm., black and white, sound. Produced by the U. S. Army. Procurable on loan from the Army Surgeon of the Army Area in which the request originates.

Part 1, "The Primary Examination" (showing time 20 minutes [PMF 5177A] 1950), rightfully stresses the importance of the initial examination, which must be as complete and as thorough as possible. History-taking and physical examination, including sigmoidoscopy, are presented and evaluated. The simpler laboratory facilities which are available in any doctor's office, such as for blood cell counts, urinalyses, and guaiac tests, are emphasized. In this instance a lesion of the sigmoid was suspected. The endoscopic views of the mucous membrane of the rectum and sigmoid were rather noninformative, since they lack the very necessary element of color.

Part 2, "Special Technics and Apparatus" (showing time 21 minutes [PMF 5177B] 1951), carries this case further, demonstrating the utilization of more formidable diagnostic procedures, such as fluoroscopy, roentgenography, cytologic study, and biopsy. This section of the film also illustrates the essential study of a case of achalasia of the esophagus, and another case of carcinoma of the stomach. Here, too, the endoscopic views of the esophagus were in need of color.

In general, these films demonstrate excellent planning and presentation. They rightfully stress the important role which the general practitioner plays in the early recognition of these lesions. Part 1 is recommended for the instruction of medical students and residents and as a review for general practitioners. Part 2 is recommended for the instruction of residents and interns and as a review for general practitioners.

Thrombosis and Embolism: Part I. Pathogenesis and Clinical Manifestations: 16 mm., black and white, sound, showing time 18 minutes. Produced in 1948 by Norman P. Schenker, M.D., in cooperation with the Gynecological and Obstetrical Clinic, Cantonal Hospital, Geneva, H. de Watteville, M.D., and the Department for Medical Research, F. Hoffmann-La Roche & Co., R. Jurgens, M.D. Procurable on purchase ($60.00) from Medical Film Institute of the Association of American Medical Colleges, 2 East 103rd Street, New York 29.

This Swiss film reviews the clinical manifestations of postoperative thrombosis and embolism and considers in detail the physiopathological processes underlying the disorder. This is a highly interesting and stimulating effort to incorporate into one film a great deal of factual knowledge. The sound track, particularly in the first part of the film, is poor and is therefore disturbing. The spelling of the names of certain clotting factors may be foreign to the American audience (fibrinogine and thombine). There are certain obvious errors in the text, the most important one being a repeated statement that the embolus obstructs the bronchus of the lung.

Looking at it as a whole, this film is a notable attempt to summarize in a didactic manner factual knowledge about this disease. The clinical part of the film is unfortunately too short and represents the current teaching in Europe. One might object seriously to the omission of the muscle thrombus in the calf and its clinical detection. The visualization of thrombus formation under the microscope is an excellent illustration of the clotting phenomenon and in itself is a notable contribution. This does not represent the best up-to-date thinking on this problem in this country. It should be restricted to a group of research workers who are interested in this field but not released to the general medical audiences or to medical students.

The film is well organized and the photographic quality is good.

Subtotal Gastrectomy: 16 mm., color, sound, showing time 33 minutes. Prepared by John L. Madden, M.D., St. Clare's Hospital, New York. Produced in 1951 by and procurable on rental or purchase from Sturgis-Grant Productions, 314 East 46th Street, New York 17.

This film demonstrates a subtotal gastric resection utilizing a modification of the Reichel-Polya-Balfour type of procedure. The gastrojejunal anastomosis is accomplished by using a long loop placed antecolic with an isoperistaltic anastomosis. The patient is a 56-year-old white man with a diagnosis of chronic duodenal ulcer associated with partial obstruction. The legend describing the case history is projected on the screen at the time the commentator presents his running commentary. To read and to listen to different thoughts simultaneously is confusing; either one of these presented singly would have been preferable. The preoperative and postoperative roentgenograms were presented well.

The incision is outlined but not described. It would have been helpful had the limits of the mobilization of the greater curvature been stressed. Mention was made that vascular adhesions were being severed. However, these structures appeared to be branches of the usual pancreaticoduodenal artery, which are normally situated in this position. In mobilizing the lesser curvature it would have been far better and anatomically correct had the term "right gastric artery" been used rather than simply stating that the hepatoduodenal ligament is severed. The anastomosis was well done. The film presents good technique and an adequate resection for duodenal ulcer. It can be recommended for those interested in gastric surgery. Except for a few scenes that are slightly blurred, the photography is well done.

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ABSTRACTS

Charitable Hospitals: Liability for Negligence of Nurse's Aide.—The plaintiff sued for damages alleged to have been sustained as a result of the negligence of a nurse's aide employed by the defendant. From an order directing a verdict in favor of the defendant, the plaintiff appealed to the Supreme Court of Arizona.

In the early part of 1948, the plaintiff entered the defendant hospital for care and treatment of a torn sciatic nerve from which she was suffering. By February 29 of that year she had almost completely recovered and on that date was being conveyed from her room for a physiotherapy treatment. The physiotherapy department where the treatment was to be administered was located in a building forming a part of the hospital but some distance from the building in which the plaintiff's room was located. There was employed at the hospital at that time a nurse's aide, who was instructed on this particular day to convey the plaintiff upon a stretcher to the physiotherapy department for her treatment. Leading from the door of the building in which the plaintiff's room was located was a ramp down which the 4-wheel stretcher had to pass on its way to the other building. The nurse's aide sought to procure help to get the plaintiff down the ramp but, being unable to find assistance, undertook the task alone. She lost control of the stretcher on the ramp. It rolled around several times and finally turned over, throwing the plaintiff to the ground, causing severe fright and shock. The plaintiff claims that soon thereafter she began to suffer, and ever since has continued to suffer, great pain in her upper back, shoulders and neck. It is claimed that the accident and injury occurred as a result of the negligent handling of the stretcher by the nurse's aide, and that the defendant had failed to exercise due care in employing her as a nurse's aide.

We are definitely of the opinion that the question of whether or not defendant exercised due care in the employment of the rse's aide should have been submitted to the jury, said the preme Court. While it is true that there is no conflict in the idence as to what investigation the defendant made before nploying her, we are of the view that the evidence, taken as a whole, is of such a character as to cause reasonable men to reach entirely different conclusions as to whether defendant did or did not exercise due care in employing her. The counsel for the defendant, however, urged the court to reconsider the entire question of the liability of charitable institutions for torts committed by their employees.

The Supreme Court had previously declared it to be the law in this state that charitable institutions are not liable for the torts of a servant where due care had been exercised in her selection. These decisions were bottomed upon the ground of public policy. Realizing that public policy is, in its very nature, always fluctuating, varying with customs growing out of changing social, political and economic conditions and recognizing the radical changes that have taken place in each of these fields of activity during the past two decades, we believe, said the Supreme Court in the present case, it is not only proper but necessary that we reconsider the rule laid down in the prior case.

There are four reasons generally assigned for denying the liability of corporate charitable institutions for the torts of their employees:

1. The "trust fund" theory, i. e., that the funds and property of these institutions are held in trust and cannot be diverted to purposes other than that designated in the trust.

2. That the doctrine of "respondeat superior" cannot be extended so as to apply to charitable institutions because such institutions are not operated for profit.

3. The "implied waiver" theory, i. e., that when one enters a hospital for treatment he, by accepting the services rendered him, waives all right to claim damages for injuries suffered as a result of the negligence of the hospital or its employees. In other words he assumes the risk of negligence.

4. "Public policy," i. e., that to allow recovery would be against public policy.

When boiled down to its final analysis, said the Supreme Court, the rule of nonliability of these institutions as declared by all of the courts so holding, has been based upon the ground of "public policy," assigning as reasons therefor (1) that it wrongfully diverts trust funds from the purposes for which the trust was created and if permitted would stifle charity by discouraging donations for charitable purposes by those who are charitably minded (2) that it wrongfully extends the doctrine of "respondeat superior" to embrace corporations engaged in business not operated for profit or (3) that, by accepting the treatment received, the patient assumes the risk of negligence and impliedly agrees to waive liability on the part of the institution for torts committed by it or its employees. The Supreme Court then considered very thoroughly the arguments for and against each of the above theories upon which the doctrine of immunity has been based and reached the conclusion that the declaration of "public policy" is primarily a legislative function. The courts unquestionably have authority to declare a public policy which already exists, and to base its decisions upon that ground, but, before courts are justified in declaring its existence such public policy should be so thoroughly established as a state of public mind, so united and so definite and fixed, that its existence is not subject to any substantial doubt. It is equally true that, when the reason for the existence of a declared public policy no longer obtains, the courts should without hesitation declare that such public policy no longer exists. During the past two decades, the court continued, both the Federal Congress and the legislatures of practically all of the states have in various forms declared a public policy to exist in this country that is diametrically opposed to that invoked in the cases to sustain the immunity of charitable institutions from liability for damages for the torts of their servants. As examples practically every state has enacted a workmen's compensation law, occupational disease disability laws making employers liable to workmen if the injury or illness arises out of and in the course of their employment regardless of any question of negligence, employment security acts designed to take care of individuals during periods of enforced idleness, and even in cases of voluntary strikes under certain circumstances thus relieving the unfortunates of the burdens of misfortune and shifting such burdens to the shoulders of the public at large. In addition to these laws Federal legislation has encompassed the entire field of welfare and social security. We believe, the Supreme Court concluded, that these legislative declarations of public policy which relieve the individual of the burden of his misfortunes and make the general public bear the load, levying taxes directly or indirectly to carry out such policy, completely repudiate the rule of nonliability of charitable institutions for the torts of their servants based on public policy. For these reasons we are of the opinion that if public policy ever required that charitable institutions should be immune from liability for the torts of their servants, that public policy no longer exists. The Supreme Court therefore expressly overruled the holding in its prior case, and held that charitable institutions are liable for the torts of their servants from which injury proximately results to a third person, whether such person is a stranger or patient and whether the patient is a paying or nonpaying one.

Accordingly the judgment of the trial court directing a verdict in favor of the defendant was reversed and the cause was remanded for a new trial. *Ray et ux. v. Tucson Medical Center, 230 P. (2d) 220 (Arizona, 1951).*

Cortisone and Corticotropin in Acute Rheumatic Fever.—Of 14 patients with acute rheumatic fever, 10 were treated with cortisone and 4 with corticotropin (ACTH). Cortisone was given for 22 to 55 days, with a total dose of from 1.175 gm. to 5.15 gm. Corticotropin was given for 16 to 38 days, with a total dose of from 410 to 825 mg. To be most effective cortisone or corticotropin should be given in adequate amounts early in the acute phase of the attack of rheumatic fever. Use of the drug in reduced amounts given continuously or in courses should be continued until the disease is inactive. Neither drug seemed to cure the disease or to shorten the usual duration of the acute rheumatic state. The acute manifestations of rheumatic fever were suppressed, but when administration of the drugs was discontinued exacerbations recurred until the disease had completed its usual course. Of 11 patients, 10 in their first attack of rheumatic fever and 1 in a recurrent attack of the disease, in whom evaluation of cardiac damage was attempted, 6 had no cardiac murmurs or evidence of cardiac enlargement when reexamined 1 to 10 months after their dismissal from the hospital. Two of these patients later had recurrent attacks of rheumatic fever, with reappearance of murmurs and cardiac enlargement. Five patients who received cortisone had clinical evidence of carditis before the drug was given. Cortisone exerted a definitely favorable effect on carditis in these patients. Observation of the 14 patients over a much longer period will be required to determine whether permanent cardiac injury has been sustained and to evaluate the extent of the injury when present. In one patient, organic valvular defects and cardiac hypertrophy resulting from previous attacks of rheumatic fever were not modified by administration of cortisone. Cortisone and corticotropin did not render patients immune to recurrence. Use of one or the other drug for the treatment of acute rheumatic fever should be supplemented by the most effective prophylactic measures to prevent the occurrence or recurrence of this disease. In only one patient was it necessary to discontinue the use of these drugs, and in that instance it was owing to the use of an unsatisfactory preparation of corticotropin.

Boric Acid Poisoning.—The occurrence of boric acid poisoning is reported in a girl, aged 9 months, with a diaper rash, whose father sprinkled powdered boric acid freely on the diapers and the skin lesions. Her buttocks became excoriated and extremely erythematous, respirations became rapid and shallow, a bright red confluent macular eruption of her face, head, neck, and extremities developed. She vomited coffee-ground material and passed bloody stools. Temperature rose to 104.9 F. The patient was alternately semicomatose and comatose, responding intermittently to painful stimuli. A specimen of urine obtained by catheter contained 1.6 mg. of boron per milliliter. Fluids and blood were given intravenously to combat the circulatory collapse and dehydration. Adrenal cortical extract was given because of the collapse and poor appearance of the infant. Penicillin and dihydrostreptomycin were administered because death had occurred from bronchopneumonia in some of the reported cases. The patient began having generalized twitching and sedation was used cautiously to control it. She died 26 hours after admission to the hospital. Necropsy revealed ulceration of the skin of the perineum, acute hemorrhagic enteritis, minimal ascites, cloudy swelling and central necrosis of the liver, and pulmonary congestion and edema. With the exception of the excoriation and desquamation of the epidermis and the hemorrhagic enteritis, the pathological findings could all be due to profound shock. Boron contents of urine and tissues were determined by spectrographic analysis; the amount of boron in brain, liver, kidney, heart, thymus, muscle, whole blood, and serum varied from 0.20 to 0.37 mg. per gram of tissue. Boric acid and sodium borate are sufficiently poisonous to cause severe symptoms and death when used in amounts commonly considered to be harmless. About 9 oz. (255 gm.) of powdered boric acid were used in this case. Boric acid is readily absorbed by different routes and is particularly insidious, in that symptoms may be minimal until a lethal or near lethal dose has been absorbed. The most characteristic findings are the gastrointestinal symptoms and the typical erythematous rash. In the more severely poisoned patient there is a shock-like picture and severe central nervous system involvement. The diagnosis may be further substantiated by the demonstration of boric acid in the urine. There is no known specific treatment for boric acid poisoning, and consequently treatment is symptomatic.

Cortisone in Experimental Sclerosis.—Of 40 relatively old chickens, 20 were given daily subcutaneous injections of cortisone acetate in doses of 4.5 mg. per kilogram of body weight for 14 days. The other 20 birds, the control group, were not given any treatment. On the 15th day after the first injection given to the treated birds, all 40 were killed by electricity. The incidence of coronary sclerosis was determined by counting the number of arteries with any degree of intimal proliferation and comparing this number with the total number of arteries examined. The

The Association library lends periodicals to members of the Association and to individual subscribers in Continental United States and Canada for a period of five days. Three journals may be borrowed at a time. Periodicals are available from 1940 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

An asterisk (*) before a title indicates that the article is abstracted.

severity of coronary sclerosis was assessed by grading and by actual measurement. There were almost twice as many foci of arterial disease in the control group (390 lesions in 1,484 cross sections of arteries, or 26%) as in the cortisone-treated group (191 lesions in 1,355 cross sections of arteries, or 14%). The size of naturally occurring fibrous plaques of the coronary arteries of the cortisone-treated birds was appreciably reduced. Thus, under the conditions of the experiment, an apparent fibrolytic effect of cortisone was achieved. There is very little similarity between end-stage coronary sclerosis of chickens and coronary atherosclerosis of man. There is, therefore, no indication from this experiment that cortisone might be efficacious in the treatment of human coronary artery disease. However, there are human diseases, such as endarteritis obliterans, rheumatic and syphilitic arteritis, periarteritis nodosa, and diffuse pulmonary vascular sclerosis, that are accompanied by cellular and fibrous proliferation of the intimal coat of arteries. Attempts to influence the course of the stenosing arterial lesions in these diseases by cortisone therapy would be justified.

Pathogens in Frozen Foods.—This paper stresses the need for development of methods for finding pathogens in frozen foods. The survival and behavior of certain pathogens in frozen beef and peas were studied, and the effectiveness of certain culture media in recovering viable cells was determined. The data presented showed that certain pathogens when frozen in beef or in peas will survive for many months at —9 C and —17.8 C. The metabolic requirements of the cells apparently are markedly altered, since a highly nutritive medium, YE-VI agar (yeast extract-veal infusion), will recover much larger numbers than the selective media, such as MacConkey agar, desoxycholate agar, or violet red bile agar. The number of bacteria recovered on these selective media from successive samples of frozen food decreases as storage is continued at subfreezing temperatures. Apparently the freezing process, as well as the heating process, alters the nutritional requirements of bacteria—at least, more viable cells can be detected if they are given a booster dose of needed metabolites. YE-VI agar accomplished this purpose very well. Without such a medium the pathogen may not be detected, and false confidence regarding its significance in a food may result. The longevity of the pathogens, especially in the frozen beef, is significant in this connection.

Effect of Surgical Procedures on Gastric Acidity of Ulcer Patients.—To determine the effect of surgery on the gastric acidity of ulcer patients, tests were made on 10 normal persons, 41 patients with duodenal ulcer, and 12 patients with gastrojejunal ulceration following a variety of operations. The quantity of acid in the gastric contents of duodenal ulcer patients was found to be greater than in normal persons following stimulation by insulin, beef broth, and histamine. The hydrogen ion concentration in the gastric contents was also greater in duodenal ulcer patients than in normal persons, particularly under fasting conditions. Patients who had gastrojejunal ulcers following various operations for duodenal ulcer had an acidity similar to that of persons with untreated duodenal ulcers. Resection of 50% of the stomach combined with vagotomy resulted in reduction in both the quantity of free acid and the hydrogen ion concentration in the gastric contents. The effect of this combined procedure and of subtotal resection alone on both quantity of free acid and hydrogen ion concentration was more marked than that following vagotomy plus posterior gastroenterostomy. When gastric resection was combined with vagotomy, removal of more than one-half of the stomach appeared to be no more effective than removal of approximately half the stomach, but removal of an estimated one-third of the stomach was considerably less effective. The results of removal of 50% of the stomach combined with vagotomy seem superior to those of more radical resections with or without vagotomy. If vagotomy combined with posterior gastroenterostomy gives adequate protection against the ulcer diathesis it is probably not because of the effect on gastric acidity alone. The acidity following this procedure is frequently within the range found in patients in whom gastrojejunal ulcers have developed. The greatest drawback to procedures involving resection of the vagus nerves is the hazard that the denervation may not be complete. Also, the possibility of regeneration of the vagus nerves has not yet been excluded.

Gastric Antrum and Ulcer Formation.—Experiments on dogs revealed that transplantation of the antrum of the stomach into the side of the transverse colon greatly increased gastric secretion. This is due to the excessive or long-continued production of a humoral agent, gastrin, since it occurs if all of the nervous connections between the antrum and the stomach have been divided. When the antrum of the stomach was transplanted into the colon and the intestinal continuity was reconstructed by gastrojejunostomy, large stoma ulcers developed in 80% of the animals. Transplantation of the antrum of the stomach into the colon with reestablishment of intestinal continuity by gastroduodenostomy resulted in the formation of stoma ulcers in 20% of the animals. When the entire stomach was isolated from the intestinal tract and its vagus innervation interrupted, a meager secretion of gastric juice was produced, and animals were kept for many months, or indefinitely, without the production of ulcers in the isolated stomach. When the antrum was removed from the isolated stomach, however, and transplanted into the colon as a diverticulum, gastric secretion was greatly increased, and ulcers regularly developed in the isolated stomach, progressed, caused hemorrhage, or perforated, in a relatively short time. Although a hypersecretion of gastric juice of antrum origin results in ulcer formation in animals, evidence is not yet available to indicate that the hypersecretion of gastric juice characteristically found in duodenal ulcer patients is due to hyperfunction of the antrum, although this possibility should be kept in mind. The development of gastric and stoma ulcers in dogs when the antrum of the stomach is transplanted into the colon provides a new method for the production of ulcers that resemble clinical lesions and the opportunity to evaluate various prophylactic and therapeutic measures. The relatively few stoma ulcers that appeared following gastroduodenostomy as compared with the high incidence and large size of the stoma ulcers that appeared following gastrojejunostomy would seem to indicate a much greater resistance of the duodenal as compared with the jejunal mucosa and suggest that gastroduodenostomy may be preferable to gastrojejunostomy as a drainage operation.

Subtotal Adrenalectomy in Hypertension.—Hypofunction of the adrenals (Addison's disease) is associated with hypotension, whereas certain types of hyperfunction of the adrenal gland, e. g., Cushing's syndrome and pheochromocytoma, are associated with hypertension. These facts and the unsatisfactory results of sympathectomy in hypertension induced Zintel and associates to try subtotal adrenalectomy. Their procedure is original only in regard to the amount of adrenal tissue removed. In 1949 they began to remove one adrenal gland completely at the time of the second stage thoracolumbar sympathectomy in patients with severe essential hypertension, but unilateral adrenalectomy produced no changes when the remaining adrenal was functioning. In 1 of the 16 patients who had unilateral sympathectomy and adrenalectomy, 90% of the remaining adrenal was subsequently removed, after which the blood pressure became normal. They removed from 88 to 98% of the adrenal in 26 patients with severe essential hypertension. In 11 of these, removal of the adrenal tissue was in addition to a thoracolumbar, supradiaphragmatic, or subdiaphragmatic sympathectomy. In 13, up to 98% of the adrenals was removed but no sympathectomy was done, and in 2 patients complete adrenalectomy was performed. Results were evaluated in 11 patients, who were observed for more than four months; three of these patients died. In the eight living patients the average blood pressure before adrenalectomy was 228/142; from 4 to 12 months after adrenalectomy it was 167/108. All of the eight improved in one or more of the following symptoms: headache, nausea, vomiting, dyspnea, decreased vision, and weakness. All were able to return to part-time or full-time activity, whereas they were incapacitated before adrenalectomy. In six of the eight patients slight to moderate increase in pigmentation of the skin has developed; two require adrenal replacement therapy at present. The possibility that subtotal adrenalectomy may find its greatest usefulness as an adjunct [illegible] or extensive sympathectomy and splanchnicectomy [illegible] being studied.

Chronic Amebiasis.—The occurrence of chronic amebiasis is reported in 238 private patients in San Pedro, Calif., from March, 1947, to December, 1950. Parasitism due to Endameba histolytica is one of the commonest chronic diseases in the United States. Of the 238 patients, 60 had symptoms pointing to a pathological process in the right iliac region, although their complaints were actually caused by E. histolytica. Differentiation of chronic amebiasis from acute appendicitis thus is important and difficult; generalized abdominal cramps, anorexia, vomiting, fever, and leukocytosis are more suggestive of acute appendicitis than of amebiasis, while pain in the lower right part of the abdomen, accompanied by mild to moderate tenderness and unassociated with other symptoms, may be frequently due to chronic amebiasis. Abdominal pain caused by amebiasis may simulate numerous other conditions besides appendicitis, such as cholelithiasis, irritable colon, or peptic ulcer. Neuromuscular symptoms, such as myalgia and leg pain, drowsiness, poor memory, exhaustion, and easy fatigability, often suggest the diagnosis of psychoneurosis. Circulatory symptoms were not outstanding in the authors' patients. Only constant vigilance of the physician coupled with an awareness of the various clinical conditions simulated by amebiasis will suggest the presence of the disease. The diagnosis of amebiasis is a laboratory procedure. Examination of the feces is part of any thorough physical examination and is possibly as important as routine blood or urine examinations.

Poliomyelitis Following Tonsillectomy.—In Los Angeles, in the summer of 1950, poliomyelitis followed tonsillectomy within 15 days in six children between the ages of 4 and 9 years. Of the six patients, five had bulbar involvement and two died. Of 6,040 cases of poliomyelitis occurring in California during 1948 and 1949, 30 followed tonsillectomy or adenoidectomy within two months, and 16 (53.3%) of the 30 patients had bulbar involvement. Evidence thus points to a risk of bulbar involvement significantly higher following tonsillectomy and adenoidectomy than in cases not following these surgical interventions, thus supporting the policy of deferment of elective tonsillectomy and adenoidectomy during increased incidence of poliomyelitis.

*Gout—Recent Advances. E. S. McCabe.—p. 126.

Gout: Recent Advances.—According to McCabe, gout seems to be the result of an inborn defect of metabolism, which at some time or other manifests itself as hyperuricemia and/or gouty arthritis. Hyperuricemia is found in the blood of a large percentage of relatives of gout patients. Some investigators concluded that hyperuricemia results from a single autosomal dominant gene and that only a small percentage of the heterozygous persons manifest gouty arthritis, whereas homozygous persons are prone to have tophaceous gout as well. The changes that occur in the uric acid metabolism and the resultant symptoms can apparently be accounted for by the outpouring of steroid hormones during the alarm reaction precipitated by emotion, infection, surgical procedures, physical exertion, allergy, alcohol, dietary indiscretion, and drugs, e. g., liver extract. An allergic factor may be the synergist that magnifies small changes in the desoxycorticosterone-11 oxysteroid ratio. The first attack (stage 1) of acute gouty arthritis usually occurs suddenly, lasts about 3 to 10 days, and then disappears completely. It affects the great toe or the instep, ankle, knee, or other region. The disease usually increases in tempo and severity, attacks coming on semiannually or oftener. Later attacks (stage 2) are prone to be polyarticular and febrile. With the polyarticular stage, subcutaneous tophi and involvement of bursae are common. Osseous tophi may be found in chronic gouty arthritis. The mental aspects of the disease are frequently seen in phase 3, when the patient's memory is impaired; the speech becomes thick or slurred, and the patient may become irritable. The early monarticular attack may be aborted by a saline cathartic and colchicine. This may be followed by sodium salicylate or cinchophen for a few days to combat hyperuricemia. At times morphine may be necessary to relieve the pain. The diet should be low in purines and fats and high in carbohydrates. Alcohol should be avoided. In chronic gouty arthritis fever therapy may be required. If tophaceous ulcers occur, débridement usually results in prompt healing. In gouty nephritis, a low protein diet and a more generous fluid intake are demanded. Corticotropin has been shown to influence uric acid excretion. It hastens the control of the acute attack, but it can also precipitate an attack if given in a period of remission. Final evaluation of this hormone requires a more intensive trial. Cortisone does not appear to be of as much value.

*Fractures of Metatarsals and Tarsals. R. J. Bennett.—p. 423.

Fractures of Metatarsals and Tarsals.—The 631 patients reviewed in this paper had 842 metatarsal and 62 tarsal fractures, a total of 904 fractures. The first metatarsal was the most frequently fractured metatarsal, and the navicular was the most frequently fractured tarsal bone. It is interesting that about half of the metatarsal fractures (422 of 842) and exactly half of the tarsal fractures (31 of 62) involved single bones. Prompt reduction is the most important step in treatment of fractures of the tarsals and metatarsals. Where the fracture is displaced or compound, an anesthetic is indicated. Adequate fixation is imperative. In only a few instances was open reduction necessary and in only a few cases was the interposition of tissues found. The oblique fractures of a metatarsal were most difficult to control during healing. These were most satisfactorily held by means of a stainless steel pin and a rubber band extension placed through the distal phalanx of the toe. In most simple fractures, union was affected in from four to eight weeks, except in cases in which there were complications such as burns and crushed tissues, and in a few cases in which the patient did not fully follow instructions. In a few cases there was decalcification of the fractured bones. Arteriosclerosis, as evidenced by a pipestem posterior tibial artery, seemed to slow the healing process but did not stop it. Depending upon the amount of callus present, weight-bearing was allowed in an average of 8 to 12 weeks. In cases in which there was a delay or failure to restore normal alignment temporary or permanent disability resulted. Both the frequency and severity of fractures of the bones of the feet are less than they were 10 years ago, owing to intensive safety programs and protective devices for the feet.

Corticotropin in Lepra Reaction.—Lepra reaction is a troublesome incident in the chronic, drawn-out course of lepromatous leprosy. There has been no way of controlling satisfactorily the characteristic fever, malaise, joint and muscle aches, and cutaneous lesions that periodically beset many of these patients. Since corticotropin has produced symptomatic benefit in conditions regarded as "allergic," its trial in the lepra reaction appeared logical. Six patients with lepromatous leprosy undergoing lepra reaction were given corticotropin in doses of 40 to 80 mg. a day for a maximum of seven days. A rapid regression of the reaction symptoms occurred in all cases, and in most of them the temperature fell to normal within 24 hours. Iridocyclitis in one patient and peripheral neuritis in two others were rapidly improved, but most of the symptoms returned a few days after cessation of treatment. It is felt that through the rapid control of the reaction symptoms, corticotropin may contribute to the treatment of leprosy, particularly in the cases in which the reaction is an obstacle to the continued administration of a chemotherapeutic agent.

Corticotropin in Experimental Poliomyelitis.—This report deals with experiments to determine the effect of corticotropin on the course of experimental poliomyelitis in mice and monkeys. In each of two experiments corticotropin was given in doses of 25 mg. every six hours to 12 rhesus monkeys for three days before intracerebral inoculation of the Minnesota strain of poliomyelitis virus. Administration of the drug was continued in six of the animals until the onset of paralysis. Six controls in each experiment received virus but no hormone. A physiological response was obtained with the hormone, as shown by the precipitous drop and subsequent low level in the number of circulating eosinophils and by the increased excretion of 17-ketosteroids in the urine. There were no changes in the fasting blood sugar values or glucose tolerance curves. In all 24 monkeys treated with corticotropin and in 10 of 12 controls poliomyelitis developed. In 4 of 12 monkeys receiving continuous treatment, paralysis occurred on the fifth day, two to three days earlier than the first paralysis in the 12 controls. Paralysis occurred 0.6 to 2.6 days earlier in the groups continuously treated than in the controls, and no earlier or 1.0 day earlier in the groups treated only before inoculation with the virus. This suggests that corticotropin not only fails to induce increased resistance to the virus but appears to render the host slightly more susceptible.

Alumina Gels to Prevent Urinary Calculi.—Renal stones are prone to recur after excision and to increase in size despite all known preventive measures. The treatment most commonly employed attempted to reduce urinary phosphate precipitation by continuous acidification of the urine. However, this treatment is often limited in effectiveness by the presence of ammonia-forming organisms in the urinary tract and impairment of renal function. Under such circumstances, a highly acidifying regimen is hazardous, because of the danger of acidosis. In many patients with urinary infection no amount of acidification will reduce the urinary pH to the desired acid range. The present study was undertaken to evaluate certain alumina gels in preventing formation and enlargement of renal stone and to determine the metabolic role of magnesium in the development of urinary calculi. It was found that alumina gel causes reduction in urinary inorganic phosphorus and increases excretion of phosphate in the stool of normal subjects and those with stones. Aluminum hydroxide gel (amphojel®) with magnesium trisilicate was administered, in doses of 30 to 45 cc. four times daily, for two and a half years to 34 patients to prevent urinary calculi. In 30 the treatment was successful. Of three patients who did not adhere to the regimen, one showed stone growth and the other passed a stone through a nephrostomy tube. In a third, stones formed proximal to a ureteral stricture. In a fourth patient, with idiopathic hypercalcinuria, recurrence was attributed to a high urinary calcium level. There was no evidence of decalcification of the skeleton or other ill effects in any of the patients studied. Observations on two uremic patients suggest that the phosphate is diverted through the gut, thus partially relieving the kidney. This may be of value in uremia by facilitating excretion of urea, with reduction of serum urea nitrogen. Ten patients who had received aluminum hydroxide gel with magnesium trisilicate previously were treated with an aluminum carbonate gel (basaljel®). It reduced urinary phosphorus excretion to lower levels than did plain aluminum hydroxide gel alone or combined with magnesium trisilicate and was found more palatable. The aluminum carbonate gel, therefore, appears to be the drug of choice for prophylaxis of calculi in the urinary tract. Since experiments suggest that a high urinary magnesium level may increase solubility of the calcium oxalate and maintain all calcium in solution, it appears advisable for stone-forming patients to take a diet adequate in magnesium to reduce endogenous oxalic acid excretion to a minimum.

Osteitis Pubis.—Osteitis pubis has been designated also as periostitis pubis, osteochondritis pubis, panosteitis pubis, osteoporosis of the pelvic bones, and acute bone atrophy of Sudeck. Lavalle and Hamm show that osteitis pubis is a true inflammatory disease of the anterior pelvic girdle and not a sterile necrosis of bone as in Sudeck's atrophy. This paper concerns pathological and bacteriological studies in three cases, all of which followed retropubic prostatectomy, and with the autopsy of a case in which healing occurred and the patient died 18 months later of another disease. In the three cases in which tissue was obtained, a clinical diagnosis of osteitis pubis was made and confirmed by roentgenological findings. In two cases a pure culture of Pseudomonas aeruginosa was obtained and in the third patient a mixed infection of Ps. aeruginosa and Proteus vulgaris existed. These gram-negative organisms are bacteria of low virulence and low pathogenicity. This explains the long incubation period between the prostatectomy and the onset of symptoms of osteitis pubis. More biopsies in other cases will be needed to show whether the organisms can produce this disease. Pathologically the lesion consists of subacute inflammatory infiltration and chronic inflammation involving the periosteum, bone, and cartilage. Plasma cells, eosinophils, and granulation tissue are seen in the inflammatory tissue. All of the known sulfonamides and antibiotic agents were tried, and none were found to be specific. Prophylaxis is the best treatment. The skin may be prepared with either green soap or the newer antiseptic detergents, but the authors are convinced that the ordinary preoperative painting of the suprapubic region is not sufficient to prevent osteitis pubis.

Arteriography.—The practical value of arteriography and its hazards are evaluated on 80 patients in whom arteriography was done at the St. Louis Hospital. Hazards mentioned by other investigators include hemorrhage, extra-aortic injection of contrast medium, acute iodinism, allergic reaction, mesenteric thrombosis, perforation of an intraperitoneal viscus, pneumothorax, aortic intramural injection, and injection of full quantity of contrast medium into a branch of the aorta. The authors concluded that translumbar arteriography is relatively safe if the procedure is performed with attention to detail by one with detailed knowledge of the regional anatomy and adequate skill. Proper preoperative evaluation of the patient's renal, cardiac, and liver reserve should be made. Sensitivity to contrast medium should be checked. The cases most likely to benefit from arteriography are those in which the diagnosis, prognosis, and management cannot be definitely stated by the previous urological examination. The method was found helpful in the differential diagnosis of renal masses: in hypernephroma, polycystic disease, solitary cyst, hydronephrosis, retroperitoneal tumors not arising from the kidney, and horseshoe or ectopic kidney. Arteriography was helpful also in selecting the proper operative procedure. Nephrectomy rather than plastic repair was indicated in the presence of scanty blood supply to a hydronephrotic kidney; renal vein involvement in hypernephroma suggested an inoperable condition; distribution of renal supply suggested heminephrectomy in certain cases of renal calculus with calycectasis. Arteriography was helpful also in aneurysms of the aorta, the renal artery, and in other branches of the aorta.

Tumors of Spine and Spinal Cord: Diagnostic Significance of Back Pain.—The diagnosis of neoplasms of spine and spinal cord is often delayed because backache, their most frequent presenting symptom, is found in such a variety of disorders that its origin is often difficult to trace. Posture, sprains, and occupation, together with some form of arthritis, doubtless account for the majority of such pains, but it is of great importance to recall that back pain is the cardinal symptom in most intrinsic disorders of the spine. The authors of this paper discuss neural pathways involved in back pain, the nerve supply of the vertebrae and their ligaments, the relation of spinal nerves to vertebral structures, and the distribution of pain in spinal nerve compression. Of the primary intramedullary tumors of the spinal cord, ependymomas and astrocytomas may be relatively benign, and if discovered in time, can be successfully removed. They produce little pain. Many of the extramedullary tumors (meningiomas and neurofibromas) are benign and slow-growing. Backache, root, and girdle pains may result from root compression. Bone metastases, particularly in the spine, are the first clinical signs of some malignant diseases (lung cancer) that remain silent for a long time. Either the vertebral body or the neural arch may be involved; the intervertebral disk is singularly resistant to malignant disease, a good point to remember in differential diagnosis. Hodgkin's disease, multiple myeloma, and Paget's disease may be associated with backache. Bone infections of various types, such as tuberculosis and osteomyelitis, may be confused with malignant diseases. Marie-Strümpell arthritis (rheumatoid arthritis of the spine) and various other lesions, such as osteoarthritis, osteoporosis, and such malignant diseases as retroperitoneal sarcoma, lymphosarcoma, and leukemia, may also result in low back pain.

Biliary Tract Emergencies.—This paper concerns neglected cases of cholecystitis and acute cases occurring in elderly patients. The author includes in the neglected category those patients in whom the cholecystitis has advanced to gangrene and possibly rupture with beginning peritonitis. He believes that rising temperature, increase in pulse rate and in toxic symptoms, and changes in the blood picture call for emergency cholecystostomy or cholecystectomy. Conservative treatment (medical decompression drainage and maintenance of metabolic and fluid balance to aid liver function) in a patient with impending rupture of the gallbladder is not good practice. In the presence of obstruction of the biliary tract with damage to the liver cells, the clinician must depend on the patient's history and on palpation. A tender gallbladder with or without rigidity and with toxemia in the aged should call for lifesaving surgery. In the surgical treatment of the poor risk patient, the author advises the conservative cholecystostomy, which relieves tension and gives adequate drainage after the removal of obstructions, stones, tumors, or adhesions, thereby often saving a patient who would not have survived cholecystectomy.

Corticotropin and Cortisone in Skin Diseases.—More than 70 patients with diseases of the skin were treated with corticotropin (ACTH) or cortisone. For economic reasons the intravenous administration of corticotropin was used with increasing frequency. The drug, dissolved in 500 ml. of a 5% solution of dextrose, was given by constant drip over a period of 8 hours every day when 20 mg. was given and over a period of 12 hours every day when 30 or 40 mg. was given. The average daily intramuscular dose should be 100 mg. of corticotropin in four equally divided doses every six hours at the beginning of treatment, but in severe systemic diseases the optimal daily dose is 200 or 300 mg. per day. Younger children should receive about half the adult dose and older children nearly the adult dose. The amount of intramuscularly administered corticotropin should be multiplied by 2½ for oral or intramuscular doses of cortisone, and divided by 7 for the corresponding intravenous dose of corticotropin. In selecting the dosage one must rely above all on the clinical response. Corticotropin and cortisone were found to be of considerable value in the treatment of serious, frequently fatal dermatoses, such as pemphigus, systemic lupus erythematosus, dermatomyositis, and generalized exfoliative dermatitis. In these diseases corticotropin and cortisone represent the best treatment available and may be life-saving. Either drug may be used, since in all these conditions the adrenals are capable of responding adequately. Treatment should be started as soon as possible. In chronic inflammatory nonfatal dermatoses, corticotropin and cortisone give only temporary relief, so that their administration is justified only in severely ill patients. Once started, the treatment must be continued for long periods of time. In patients who are not seriously ill the not infrequent occurrence of undesirable side-effects with prolonged treatment may be worse than the disease. Short courses of corticotropin or cortisone are indicated in acute self-limited inflammatory dermatoses, such as drug eruptions, erythema multiforme, and anaphylactoid purpura, if the symptoms are severe enough. Some cutaneous diseases, especially atopic eczema, psoriasis, and chronic discoid lupus erythematosus have a tendency to recurrence, and the disease may be worse on discontinuance of therapy than it had been before. Corticotropin or cortisone were of little value in chronic, serious dermatoses, including scleroderma and mycosis fungoides.

Acute Nephritis in Schoolboys.—The coincidental occurrence of acute nephritis in four adolescent boys who were classmates in a private school appeared to be unusual and led to studies on the other boys. Seventeen other boys were also found to have hematuria. The incidence of hematuria among the 73 students in the two classes studied was 29%. Of the 21 boys with hematuria, 15 still had abnormally elevated Addis sediment counts seven weeks after the initial examination. Cultures of the nasopharynx were made on 85 students, and it was found that 11 boys did harbor hemolytic streptococci, including three of the boys with hematuria. The strains that were isolated, however, represented at least five different immunologic varieties. Determinations of antihyaluronidase, antistreptolysin O, and antistreptokinase in serum from 17 boys with hematuria and 20 without apparent hematuria revealed wide variations in titer, but no significant differences between the two groups. The occurrence of acute nephritis in groups of associated persons has been noted among soldiers, in whom it has been referred to as trench or war nephritis. It has also been encountered among adults in congested tenement buildings and in several children in families. To account for multiple cases of nephritis within a family, a familial predisposition has been suggested; and, in other groups, cold and damp surroundings and poor nutrition have been suggested as contributory factors. Since nephritis has been observed frequently after scarlet fever or other streptococcic infections, it has been suggested that nephritis may be caused by such infections.

Local Use of Heparin in Plastic Surgery.—The survival of a graft in the earlier stages is dependent on the nutrition of the graft from the serum bed. Not only must the graft be nourished but its waste products must be removed. In other words, there must be an exchange of tissue fluids or a movement of tissue fluids between the graft and the recipient area. The graft fails to take when this metabolic exchange does not occur. Conditions favoring failure include local thrombosis of the vessels at the recipient and graft surfaces and/or a collection of serum and blood clot between the graft and the recipient area. If venous stasis and thrombosis can be prevented, the viability of the graft can be maintained. Heparin is the ideal agent to be used here. It prevents thrombosis, aids lymphatic drainage, and improves circulation of tissues by reducing blood viscosity without affecting capillary permeability. The amount of heparin used (10 mg. per cubic centimeter) depends upon the size of the area of congestion and averages about 0.25 to 0.5 cc. This is placed with a needle inserted between the graft and the recipient area. The heparin is deposited slowly into the region, care being taken not to get it too far beyond the congested area. The regular dressing is then applied. In 24 hours, the color of the area will improve. Local use of heparin has been of value in plastic surgical procedures that require use of tube pedicle flaps, sliding flaps, or full thickness skin grafts.

Yolk Sac Technique for Isolation of Brucella.—Clots from specimens of blood received for diagnostic agglutination tests were employed. Following completion of the serological test, one-half of the clot was prepared for animal and egg inoculations. A sufficient number of eggs was incubated each Monday and Friday, so that each day of the week 3-, 4-, or 5-day-old live embryos were available. Before and after injection, all eggs were kept at 36 to 37 C. Examinations consisted of two or three subcultures from the yolk at about 4-day or 5-day intervals and, in some instances, a final harvesting of all live embryos on the 18th or 19th day of total incubation. A total of 138 blood clot specimens, of which 123 were from human sources, were inoculated into embryonating eggs. Four suis strains were recovered from the 15 animal clots included in the study. The 123 human clots were further examined by enrichment in broth and 95 of them by guinea pig inoculation. Twenty-seven clots, upon injection into the eggs, resulted in a heavy contamination and rapid death of the embryos. Thus, only 96 specimens were considered satisfactory for egg inoculations, and from this number 14 recoveries—1 melitensis, 4 suis, and 9 abortus—were made, with the egg technique yielding all but one suis strain. From these same 96 specimens the guinea pigs yielded one Brucella strain and the broth, six. Eleven isolations came from patients with acute symptoms at the time of collecting the specimens, while the other three were from asymptomatic patients. No recoveries were made from patients with chronic complaints. All isolations came from persons with agglutination titers of at least a 1:80 serum dilution. The egg embryo yolk sac technique is recommended because: (*a*) it provides living tissue cells in a compact medium; (*b*) it permits recovery of all three types of Brucella; (*c*) it gives comparatively quick results; and (*d*) it entails a minimum amount of danger for laboratory personnel.

Tetraethylthiuram Disulfide in Alcoholism.—This report reviews observations on 125 patients (including 55 previously reported) who were treated with tetraethylthiuram disulfide and have been under observation for from several weeks to 15 months. Tetraethylthiuram disulfide was found to be an effective weapon in the medical armamentarium presently available to combat alcoholism, but it is only one of several factors. Extreme caution is necessary in patients who have cardiac or cardiovascular disease. Changes in the differential leukocyte count deserve further investigation. Electroencephalographic studies indicate that tetraethylthiuram disulfide has some central sedative action, which explains why most patients show some somnolence. At the end of 15 months of therapy, 50% of patients who had previously failed in other therapeutic attempts, including Alcoholics Anonymous, showed improvement ranging from slight to complete social recovery. The pattern of changes after the first three months of therapy, and definitely after six months, showed a tendency toward either loss of contact with the clinic and no change or readjustment and social recovery. Faced with the anxiety of increasing inadequacy of adjustment, most alcoholics revert to drinking before breakdown and psychosis appear. The authors believe that this treatment should be carried out by nonpsychiatric medical practitioners under psychiatric guidance. The initial stages of therapy may be most effectively handled at a psychiatric outpatient unit, and after the reaction session the patient should be referred to his family physician for further care. Tetraethylthiuram disulfide may be administered on an outpatient basis with satisfactory results.

Congenital Absence of Gallbladder.—A woman, aged 61, was hospitalized with a provisional diagnosis of acute cholecystitis. Her attacks of subcostal pain on the right side had recently become more frequent and severer, and she was advised to have her gallbladder removed. Repeated cholecystograms failed to reveal a shadow of the gallbladder. Laparotomy revealed a normal-sized liver but no gallbladder, its fossa being represented by a deep fissure. A membrane extended from the anterosuperior aspect of the first part of the duodenum to the porta hepatis; it appeared to be continuous with the lesser omentum on the left. The common duct and portal vein were behind it. This membrane was divided and revealed an enormously dilated common duct. Many calculi could be felt in it. Eight mixed calculi were removed from the hepatic ducts above and two smaller ones from the common duct below. Ether was used to dissolve remaining stones or biliary sludge. Its use and dangers as a solvent for gallstones is discussed; it probably will never replace surgical removal, but it may be helpful in removing the overlooked stone, if it is discovered before drainage tubes are removed. Cholangiography was used postoperatively in the woman whose case is reported, to demonstrate the absence of an intrahepatic gallbladder, any remaining stones in the ducts, and the free pathway for bile into the duodenum. Information on this subject by other writers is summarized, including previous reports of 71 patients with congenital absence of the gallbladder.

Infantile Hypertrophic Pyloric Stenosis.—The Fredet-Ramstedt operation of pyloromyotomy is now firmly established in the treatment of infantile hypertrophic pyloric stenosis The patient reported on was treated before Ramstedt introduced his operation. She was born in September, 1909, and was subjected to a posterior gastrojejunostomy in November of the same year. As a child she could not eat as much as other children, but was apparently normal except for discomfort after a heavy meal. In 1935 she began to have vague indigestion, but a barium meal examination revealed a normal gastrojejunostomy. The discomfort was diagnosed as recurrent appendicitis, and the appendix was removed. It was found to be kinked, infected, and adhering to the outer side of the cecum. The symptoms were unrelieved following appendectomy. In April, 1950, the patient had an attack of severe acute abdominal symptoms, which necessitated opening of the abdomen by a right paramedian incision. No lesion was found until the duodenojejunal flexure was reached, where a perforated jejunal ulcer was discovered. Reexamination of the pyloric region revealed gross thickening of the pyloric canal, the appearance being identical with that seen at operation on infants with congenital pyloric stenosis; the patency of the pylorus seemed so doubtful that it was felt safer to perform partial gastrectomy than a simple closure of the perforation. Following subtotal gastrectomy with precolic gastrojejunostomy, progress was uneventful. The surgical specimen revealed an old congenital hypertrophic pyloric stenosis, neonatal posterior gastrojejunostomy, a tiny submucous focus of suppuration, and mucosal atrophy. The literature contained reports of 11 cases of this type, in all of which hemorrhage was the major feature. Dyspeptic symptoms were unusual, and in many cases jejunitis rather than a chronic jejunal ulcer was reported. This case of perforation brings the number to 12. The results of medical treatment are difficult to evaluate, but it is thought that if the infant can be kept alive, spontaneous relief of symptoms occurs within a few months, and the exponents of medical treatment claim a high percentage of cures. Why the pyloric tumor should persist after gastrojejunostomy and regress after medical treatment is not clear, but the persistence of the tumor must be explained by any future theory concerning the nature of infantile hypertrophic pyloric stenosis.

Annular Pancreas.—The authors report a case of annular pancreas in a woman, aged 52. The presenting symptom was jaundice, apparently due to pressure on the lower end of the common bile duct by the inflamed pancreatic annulus. Partial resection of the ring was followed by freedom from symptoms.

Annular Pancreas.—The symptoms in the 25-year-old man whose case is reported suggested total obstruction of the second part of the duodenum. The etiology was unknown, and it was not possible to arrive at a positive diagnosis, but the presence of some congenital abnormality was postulated, possibly a duodenal mesentery, with partial obstruction made complete by the huge distention of the stomach. Laparotomy revealed a small amount of free fluid in the peritoneal cavity, with some edema of the greater omentum. The entire pancreas was enlarged, hard, and nodular, and a ridge of hard tissue extended to the right in front of and around the second part of the duodenum, causing obstruction in this region. The process was thought to be carcinomatous. A posterior gastrojejunostomy was performed, and convalescence was uneventful; symptoms were completely relieved. On further consideration and in view of the patient's very good general condition, it was thought that he had chronic inflammation in an annular pancreas rather than carcinoma. This diagnosis is confirmed by the fact that he has remained well since the operation. The literature on annular pancreas is briefly reviewed. The condition can easily be missed before, or even at, operation, and it is probable that the incidence is higher than the recorded number of cases suggests. Gastrojejunostomy is probably the best method of treatment, but, if the constriction ring is thin and easy of approach, it may be divided instead. With operation the prognosis is relatively good.

Ethyl Biscoumacetate and Bishydroxycoumarin.—Anticoagulants were given to 130 patients with vascular thrombosis and its sequelae. Of the 130, ethyl biscoumacetate (tromexan®) was given in tablets of 300 mg. to 60 with cardiac infarction and 12 with extracardiac thrombosis. A loading dose of 1,200 mg. proved safe and became standard, although 2,100 mg. was given twice without incident. Between 12 and 24 hours after starting treatment, and before more ethyl biscoumacetate was administered, a prothrombin concentration test was performed; 70% of the patients were observed to have less than 50% prothrombin and 34% had entered the therapeutic range of 10 to 30% prothrombin. Usually the necessary maintenance dose lay between 300 and 600 mg. There were pronounced variations in susceptibility to ethyl biscoumacetate. A given patient's tolerance may alter widely from day to day, and there is a tendency to sudden escapes from control. It is therefore not desirable to give the drug without laboratory control. No correlation of dosage with weight or age is possible, but an initial prothrombin reading may assist in gaging the size of the loading dose. Of the 60 patients with cardiac infarction, 51 left the hospital with an end result regarded as satisfactory, and 9 died in the hospital. The fatal cases, with the exception of one patient who was inadequately treated, were poor risks. Of the 12 patients with extracardiac thrombosis, the end result was regarded in all as satisfactory. Bleeding incidents occurred in 2 of the 72 patients treated with ethyl biscoumacetate; both suffered a hematemesis from a clinically active duodenal ulcer, but neither required any more active treatment than discontinuation of the drug. Caution is necessary in treating peptic ulcer patients. Benzidine tests on the feces may be helpful in the control of their treatment. Fifty-eight patients, 36 with cardiac infarction and 22 with extracardiac thrombosis, were treated with bishydroxycoumarin (dicumarol®). Of the 36 patients, 29 left the hospital, the immediate end result being satisfactory; 7 patients died. Of the 22 patients, 19 left the hospital with an end result regarded as satisfactory, and 3 died. Of the total of 58 patients, 13 had hemorrhagic complications. All received intravenous vitamin K, and three required transfusion. Ethyl biscoumacetate is superior to bishydroxycoumarin. As it has a shorter "lag period" the use of heparin may be either obviated or restricted to a single intravenous dose. The clinical results compare favorably with those of bishydroxycoumarin therapy. Hemorrhagic complications are not only less frequent but much less severe. A fall in prothrombin concentration below 10% was not regarded as serious in the ethyl biscoumacetate-treated group.

Pathogenesis of Boeck's Sarcoid.—An attempt is made to clarify the pathogenesis of Boeck's sarcoid on the basis of observations in 70 cases. The problem of etiology is disregarded. In earlier reports the author discussed the course of the pulmonary lesions of Boeck's sarcoid and the significance of this localization for the disease in general. In these earlier studies it was found that the lungs are more frequently involved than is any other organ. The pulmonary lesion usually begins with a swelling of the hilar lymph nodes, which is usually bilateral. This stage is followed by miliary dissemination into the lungs, which may be preceded by the appearance of a fine reticulation. Then follows a more or less severe fibrosis of the pulmonary interstitial tissue through hyalinization of the lymph channels. As a rule, this completes the process in the lungs, but there may be a fourth stage, which takes the form of an indurating infiltration, and a fifth or nodular stage. The author further discusses the time relationship between the various stages of the pulmonary lesions and the involvement of other organs, particularly the lymphatic system, and the eyes, bones, and skin. In contradistinction to Schaumann, he regards the lungs as the portal of entry for the disease. Although the first demonstrable lesions occur in the hilar nodes, the lungs may become involved subsequently by retrograde lymph flow from the hilar region or by way of the blood stream during generalization of the process. It is assumed that the extrapulmonary organic foci develop during the second stage of the pulmonary process. The apparent difference in the time of their appearance can be explained by the specific differences in the organs involved. Subsequently, the lesions in the different locations follow a development according to their own individual characteristics.

Ulcerative Colitis.—In selecting patients with colitis for surgical treatment it is important that the clinical entity of ulcerative colitis be clearly defined. The authors regard as ulcerative colitis in the restricted sense of the term the lesion centered in and severest in the descending colon. Right-sided ulcerative colitis may be a disease separate from the usual form, with maximal disorganization on the left. Right-sided colitis is possibly secondary to an ileal lesion. The entire colon can become involved, and the disease can thus be confused with left-sided colitis. The treatment of the two types is different, because the usual forms of surgical treatment for ulcerative colitis, involving ileostomy or ileosigmoidostomy, have disappointing results when used for the right-sided disease. It is therefore necessary to ascertain that the disease is limited to the colon before such operations are considered. The discovery of the right-sided type of colitis should always raise suspicion of an ileal lesion, but this may even be present when the whole colon is diseased. A progress meal with nonflocculating colloidal solution of barium gives the best chance of observing the "sawtooth" appearance in the ileum or an area devoid of the usual contractions and dilations. A fat-balance test may indicate a failure of absorption, and a macrocytic anemia, abnormality of serum protein levels, or severe glossitis may be further indications of ileal dysfunction, although they are not always present. The discovery of an ileal lesion is a contraindication to operations designed to divert the fecal stream from the colon, with or without excision of the large bowel, for there is a strong tendency for the disease to become manifest above the ileostomy, or, in the case of ileosigmoidostomy, above and below the anastomosis. In such cases vagal section may provide relief.

Effect of Hexamethonium Bromide in Arterial Hypertension.—This paper reports the effects of hexamethonium bromide in hypertensive patients and compares them with those of tetraethylammonium bromide. Studies were made on 30 hypertensive patients with a blood pressure persistently above 160/100 mm. Hg. The spontaneous daily variations in blood pressure were assessed over 24 hours, and then the responses to the following drugs were tested: amobarbital (amytal®) sodium and intravenously administered tetraethylammonium bromide and hexamethonium bromide. It was found that hexamethonium bromide caused a greater fall in systemic blood pressure than did either amobarbital or tetraethylammonium bromide. The authors consider 0.2 mg. per kilogram of body weight the largest intravenous dose of hexamethonium bromide that can be given safely. Catheterization in three cases showed a fall in pressure in the pulmonary capillaries and in the pulmonary artery; a decrease in the cardiopulmonary blood volume, and (in two of the three cases) a fall in cardiac output. These changes may be due to pooling of blood in the systemic circuit. Hexamethonium bromide is from 25 to 35 times as potent as tetraethylammonium bromide and is longer-acting. There is a considerable variation in response to hexamethonium bromide, both from case to case and in the same case from time to time.

Ligation of Carotid Artery in Cerebral Arteriovenous Aneurysm.—Ligation of the common carotid artery was performed in three male patients, 11, 23, 40 respectively, and in a woman, 27, with cerebral arteriovenous aneurysm. Ligation of the common and of the internal carotid arteries was performed in a man, 35, who also had cerebral arteriovenous aneurysm. The first symptoms consisted of one or more episodes of subarachnoid hemorrhage in three patients, cerebral hemorrhage in one patient, and convulsive attacks in the other. Focal signs were present in all cases and made it easier to determine from which side the diagnostic arteriography was to be performed. Total removal of the aneurysm was deemed impossible, because its location implied severe risks. Prior to ligation the carotid artery was occluded for 20 minutes with Matas' compressor to determine whether any serious symptoms would appear. The artery was then ligated but not sectioned. Electroencephalograms were taken in two patients before, during, and after the ligation. Immediate and late complications were not observed in any case. There was regression of the neurological symptoms, and hemorrhages did not recur, not even in the woman in whom they had always occurred with menstruation. Two years after the operation the boy is well and leads a normal life, the woman has resumed her work as a teacher, and conditions in the other three patients are still unchanged. The definite effectiveness of the ligation of the carotid artery has not yet been proved. If it causes a diminution of the circulation with resulting injuries to the nervous parenchyma, it should be omitted. Also, it would be useless in instances of cerebral arteriovenous aneurysm in which disturbances are not present and a good circulation is therefore presumed. However, the good results obtained in the last years justify the assumption that ligation of the carotid artery may be beneficial in some cases of cerebral arteriovenous aneurysm.

Massive Hemorrhages Associated with Extrapleural Pneumothorax.—An investigation was made in an attempt to establish the cause of massive hemorrhages associated with extrapleural pneumothorax. These hemorrhages may occur during the surgical intervention owing to the rupture of a vessel, in which case they are easily controlled; or they may occur 24 to 48 hours after the operation as a result of a vasomotor reaction. In this case formation of hematoma and perforation may result. According to the author these hemorrhages are attributable to an erroneous indication for the extrapleural pneumothorax. He performed this operation in 200 patients with tuberculosis. Massive hemorrhage developed in 10 (5%) of them, and the postoperative course proved that there had been an incorrect indication for this intervention. Of these 10 patients, 6 had medium-sized tuberculous lesions localized in the upper right lobe. The remaining four had the exudative type of lesion, but the extrapleural detachment was difficult because of tenacious adhesions. They were, therefore, instances in which thoracoplasty would have been justified. The reason for massive hemorrhages in cases of erroneous indication may be easily understood if one considers the anatomic changes (fibrosclerosis, vascular neoplasms, inflammatory hyperemia) that are present in the pleuropulmonary and in the pleuromuscular areas in cases of tuberculosis of long duration. Thoracoplasty is, in general, indicated in the presence of old lesions. Often, however, clinical, roentgenologic, and anamnestic data are insufficient for the physician to determine the date of onset of the disease, so that the apparent indications are erroneous. In case of massive hemorrhage caused by the rupture of a vessel, hemostasis is the treatment of choice, even if it implies a second intervention. In instances of a massive hemorrhage caused by a vasomotor factor, the blood should be aspirated, and irrigation with hot water combined with administration of epinephrine hydrochloride should follow. If fibrin deposit has already occurred, making lavage impossible and insufficient, costal drainages should be performed to remove the deposit. Then, if necessary, thoracotomy and injections of penicillin, streptomycin, para-aminosalicylic acid, and sulfones should follow to prevent secondary infection and chronic empyema.

Papilloretinitis.—In examining a large number of tuberculous patients in 1947 and 1948, Gát had observed typical tuberculous changes in the papilla and the surrounding retina. The nasal side of the papilla appeared washed-out and edematous, the edema extending to the surrounding retina to a width of about half that of the papilla. The other parts of the papilla were intact, but the blood vessels were slightly dilated. Subsequently, most of the changes subsided, but connective tissue proliferated along the veins. At first Gát regarded this form of papilloretinitis as a toxic symptom, since the majority of the patients whom he examined at that time had severe pulmonary tuberculosis. Subsequently, however, Gát and Mándi found this phenomenon also in benign forms of tuberculosis. The transitory and recurrent nature of the changes and the pathohistological aspects (exudative and productive phase of allergic inflammation) suggested that papilloretinitis was an allergic rather than a toxic phenomenon. Complaints of headaches, vertigo, gastrointestinal disturbances, articular pains, and neurological symptoms suggest that allergic reactions occur also in other organs. On further investigation the authors found tuberculoallergic retinitis in 14 of 110 persons who had no complaints. Seven of these, who had no active pulmonary lesions, were tested with tuberculin. Five gave a positive, one a doubtful, and one a negative reaction. Of 25 patients who originally had negative tuberculin tests and had no changes in the eyegrounds, 15 showed a new papilloretinitis from 8 to 12 weeks after vaccination with BCG. In 12 of the 15 the tuberculin test was repeated and showed positive results in all. This proves a definite connection between the appearance of papilloretinitis and a tuberculous allergy. Since the tuberculous allergic papilloretinitis is present in miliary tuberculosis, in basal meningitis, in widespread cavernous phthisis as well as in benign forms of primary infection, and in those who have only been vaccinated with BCG, it is not a characteristic symptom of tuberculous meningitis, or a specific toxicosis, but is a temporary sequel of tuberculous allergy.

*Temporary Hemiplegia Due to Hypoglycemia: Localizations of Neuro-encephalic Effects of Hypoglycemia; Sugar Therapy in Neurology and Neuropsychiatry. J. Albert-Weil.—p. 380.

Temporary Hemiplegia Due to Hypoglycemia.—An emaciated woman, aged 46, with pronounced psychasthenia of long duration, wanted to gain weight. Her physician prescribed a subcutaneous injection of 30 to 32 units of protamine zinc insulin every evening before supper and a diet rich in sugar, flour, and pastries. One hour after the first injection of protamine zinc insulin the patient sweated profusely, her vision was disturbed, there was a tendency to obnubilation, and a sensation of excessive hunger. The disturbances subsided rapidly after the ingestion of large amounts of sugar and carbohydrates. The next morning she had a vague feeling of discomfort and hunger, which again subsided after the ingestion of sugared food. She did not receive an insulin injection that evening, but during the night right hemiplegia developed with Babinski's sign. She was conscious, had no pain, and her temperature was normal. After the ingestion of eight lumps of sugar the paresis completely subsided and Babinski's sign disappeared. On examination several days later she was perfectly normal. The author stresses the polymorphism of hypoglycemic manifestations, the complexity of their pathogenesis, and the difficulty presented by their neurocerebral localization. The delayed effect of protamine zinc insulin in the author's case suggests that this drug should not be used in nondiabetic emaciated persons in treatment to increase their weight. The hypoglycemia undoubtedly affected the motor pathways and particularly the pyramidal fasciculi. Since hypoglycemia due to insulin largely reduces the oxygen consumption by the brain, the author suggests that in certain neurocerebral conditions, such as asphyxia, carbon monoxide poisoning, stroke due to cerebral softening or cerebral hemorrhage, encephalitis, multiple sclerosis, and schizophrenia, treatment should consist of continued administration of large amounts of sugar combined with ordinary insulin, vitamin B_1 and its derivatives (cocarboxylase), and certain "glycoformative" amino acids, such as glutamic acid. Inhalation of oxygen and carbon dioxide may be used if necessary.

Treatment of Herpes Zoster with Dihydroergotamine.—Caporaletti treated 16 patients with herpes zoster with dihydroergotamine (DHE 45). Doses consisted of 0.5 cc. daily for children and 1 cc. daily for adults, for periods of from 2 to 16 days. Ergotamine and its derivative, dihydroergotamine, which act upon the sympathetic nervous system, represent the first truly effective remedy for herpes zoster, in which sympathetic factors are associated with a virus infection. The sympathicolytic and adrenolytic properties of dihydroergotamine are more pronounced than those of ergotamine, but unlike ergotamine it has no uterotonic action. In one of the author's cases, the patient was 7½ months pregnant and was given 1 cc. of dihydroergotamine daily for six days without any untoward effects.

Subacute Bacterial Endocarditis.—Between 1945 and 1948 a total of 442 patients with subacute bacterial endocarditis were treated with penicillin under a scheme organized by the Medical Research Council of Britain. The ages of the patients ranged up to 74 years, but nearly two-thirds were less than 35. Although the sexes were equally affected, disease of the mitral valve alone was almost twice as common in females as in males, whereas disease of the aortic valve alone was five times commoner in males than in females. The underlying heart lesion was congenital in 13% of the patients. The sex incidence of congenital lesions was equal, but ventricular septal defect was commoner in the male and patent ductus arteriosus was commoner in the female sex. The infecting organism was an α-hemolytic streptococcus in 87% of the cases. A dental focus of infection or a history of dental extraction was present in 48% of a representative group of 215 cases. The results of the trials of the Research Council suggest that the minimum dosage should be 2,000,000 units of penicillin daily for four to six weeks. Patients who relapsed did so within a month after the end of treatment in over 90% of the cases. After six months of apparent cure, the risk of delayed relapse or reinfection is 2% per year. There was a major arterial embolism in 35% of the cases, and in half of these it was cerebral. Coronary embolism was recognized in 2% of cases during life and was found in 13% of the autopsies. Valves were stained for organisms in 60 cases in which patients died with the infection apparently controlled; organisms were seen in 39 of these and were viable in 19. Of the 408 patients who had positive blood cultures before treatment, 14.5% died during treatment and an additional 27.4% died in the first six months after treatment; in subsequent years, an average of only 4% of survivors died each year. The 34 patients with negative blood cultures had evidence of bacterial infection, for fever responded to penicillin in 25, and in one-half of those who came to autopsy organisms were found on the heart valves. Only six patients were cured. This low proportion was due in part to the high incidence of heart failure and in part to inadequate treatment. It is suggested that this type of patient may need a larger daily dose of penicillin than patients with positive blood cultures.

Morphological and Functional Observations in Dolichosigmoid. G. Lischi. —p. 445.
*Primary Tumors of Lung and Atelectasis: Roentgenographic Aspects. C. Scarinci.—p. 461.

Diagnosis of Primary Cancer of Lung.—Clinical diagnosis of primary cancer of the lung is very difficult because of its polymorphism simulating pleuropulmonary tuberculosis, abscess of the lung, bronchial stenosis, pleuropulmonary sclerosis, and other conditions. Roentgen shadows that could be considered as characteristic of cancer of the lung have never been observed, and direct visualization of this neoplasm is rare. Therefore, the roentgenologic investigation should include tomographic and bronchographic studies. The author believes that bronchography is the most important aid in the roentgen diagnosis of primary cancer of the lung. If both the roentgenographic and bronchographic studies reveal the presence of stenosis of the bronchi and of secondary atelectasis, diagnosis of cancer is strongly suggested, because in 80% of the cases the tumor originates in the bronchi. An endobronchial sound is indispensable for carrying the contrast medium as far as possible within the bronchus for exploration. If the medium is injected slowly, it is possible to follow on the screen its course in the bronchial tree. Arrest of the medium reveals the presence of endobronchial stenosis or compression of the bronchus by a neoplastic process outside of the bronchus. As a rule atelectasis is always an early manifestation of an early endobronchial tumor, so that surgical intervention is feasible. When roentgen therapy has failed, pulmonary surgery has given gratifying results, and for this reason early diagnosis of cancer of the lung is very important. The author presents bronchograms of four patients with cancer of the lung that demonstrate the fundamental importance of this roentgenologic method.

*Observations on Sarcoleukosis. G. Paniagua, M. Morales Pleguezuelo and C. Jiménez Díaz.—p. 153.
*Treatment of Hypothyroidism with Halogen Proteins. L. de Gennes, G. Deltour, and I. Benzecry.—p. 182.

Observations on Sarcoleukosis.—The authors studied 12 cases of acute leukemia with lymphosarcomatous cells, which they call sarcoleukosis. They state that this is the most frequent form of acute lymphatic leukemia, especially in childhood. It may appear as part of generalized lymphosarcomatosis, or as an acute process apparently of primary origin. Diagnosis depends on the recognition of a cell, the sarcoleukocyte, which is found in the blood, the marrow, and all the affected organs. Sarcoleukosis is accompanied by specific tumors, which may precede the appearance of the leukemia or may occur simultaneously with it. The authors state that this type of leukemia may be the one most closely resembling the spontaneous leukemias of animals or that caused by inoculation, in which the characteristics of tumors and of leukemia alternate or are mingled. They agree with Magrassi's concept of a tumorous process caused by a virus.

Treatment of Hypothyroidism with Halogenated Proteins.—The authors treated 67 patients with various manifestations of hypothyroidism with halogenated proteins. These proteins were prepared by bromination and iodination of casein. They proved to have all the properties of thyroid extracts; they were more active, weight for weight; and, because they contain organically fixed bromine, which by its sedative action counteracts the neurotonic and heart-accelerating effects of thyroxine, they did not have its disadvantages. They were administered in progressive doses, beginning with 50 mg. a day, increasing gradually until, in certain severe cases, as much as 500 mg. was given daily. The drug was given until clinical symptoms receded, after which the daily dose was progressively diminished to 200, 100, and 50 mg. An increase in the metabolic rate, in diuresis, and in the pulse rate appeared by the end of the first week, accompanied by a decline in the serum cholesterol and the recession of clinical symptoms. Apathy and asthenia were among the first of these to disappear; the mind became keener, and the patients showed greater interest in their surroundings.

20:411-474 (July) 1951. **Partial Index**

*Primary Cancer of Lung. A. Jarne.—p. 439.

Primary Cancer of the Lung.—Jarne observed 21 patients with primary cancer of the lung. The group included 20 men between the ages of 40 and 55 and a woman 60 years old. In 14 patients, the first symptom was cough, alone or associated with pain and small repeated hemoptysis; in 7 patients, it was pain alone or associated with hemoptysis. Four patients had dyspnea, and seven had lost much weight. The sputum of all patients was negative for tubercle bacilli, whereas that of 13 patients, as well as the pleural exudates from a patient with hemorrhagic pleurisy and pleuropulmonary cancer, contained degenerate cancer cells. A diagnosis of cancer of the lung was made roentgenographically. Cancer involved the whole left lung in three cases, one lobe of the left lung in 11 cases, and one or two lobes of the right lung in 7 cases. The upper lobes were more frequently involved than the lower ones. Biopsy was made by bronchoscopy or thoracotomy. Out of 21 patients in whom this diagnosis was made, 6 did not appear for treatment, and 4 died without any treatment. Cure was obtained in one of eight patients who had roentgen therapy. The patient is still living in good health three years after discontinuation of roentgen treatment. Seven patients in this group died. In the group of three patients who had a pneumonectomy one died from cardiac insufficiency a few days after the operation. Two patients are cured and are in good health three years after pneumonectomy.

*Extraperiostal Pneumolysis: Collapse Operation of Renewed Present Day Interest. O. Christensen.—p. 1081.
*Roentgenologic Demonstration of Localization of Primary Complexes in Extrapulmonary Tuberculosis. E. F. Eisum.—p. 1085.
Late Meningitis After Fracture of Base of Brain. P. Menck-Thygesen and W. Munck.—p. 1087.

Extraperiostal Pneumonolysis.—Christensen says that by combined treatment with dihydrostreptomycin and paraaminosalicylic acid (PAS) patients with far-advanced tuberculosis may often be improved sufficiently for collapse treatment. An increasing number of patients with large cavities need collapse treatment, but thoracoplasty is contraindicated by the condition of the contralateral lung, and extrapleural pneumothorax entails the danger of perforation of large subpleural cavities. In a number of cases in this category extraperiostal pneumonolysis represents the only possibility for effective collapse therapy.

Localization of Primary Complexes of Extrapulmonary Tuberculosis.—Eisum investigated the frequency with which the portal of entry of the tubercle bacilli in patients with extrapulmonary tuberculosis can be determined by roentgenologic examination for calcifications in the lymph node component of the primary complex. Routine roentgen examination of neck, thorax, and abdomen in 144 patients with clinically certain extrapulmonary tuberculosis showed one or more portals of entry in 83 patients (58%), with calcified lymph nodes in the thorax in 69 cases, in the abdomen in 18, and in the neck in 10. The tubercle bacilli were of human type in 70 and of bovine type in 10 of 80 patients studied.

Failure of Sympathetic Regulation After Sympathectomy.—Of the 176 patients with hypertension (100 men and 76 women) operated on at the Mannheim City Hospitals during the years between 1944 and 1950 according to the procedure of Peet and Smithwick, a total of 54 patients died, 27 of these in direct connection with the operation. The surgical mortality was particularly high during the first two years of this period, probably largely because patients were operated on who later were shown not to have been suitable for sympathectomy. Of these 27 patients, 17 showed signs of infection and various forms of collapse-like failure of the circulatory system. In the second group of 10 cases, death apparently resulted from uremic coma. The preoperative examination of these hypertensive patients revealed in the great majority of cases severe vascular changes. The patients who died in uremia showed in addition before the operation great impairment of renal function. Some observations indicated particularly unfavorable circulatory conditions in the cerebral vessels. The cause of the high surgical mortality is thus explained chiefly by the type of patients operated on. Patients with hypertension in whom the functional and organic vascular disturbances are far advanced are apparently highly sensitive to an intervention that disturbs their sympathetic equilibrium.

BOOK REVIEWS

Clinical Pediatric Urology. By Meredith Campbell, M.S., M.D., F.A.C.S., Professor of Urology, New York University Post-Graduate Medical School, New York. With section on Nephritis and Allied Diseases in Infancy and Childhood. By Elvira Goettsch, A.B., M.D., Associate Professor of Pediatrics, University of Southern California School of Medicine, Los Angeles, and John D. Lyttle, A.B., M.D. Cloth. $18. Pp. 1113, with 543 illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London, W.C.2, 1951.

There is no doubt that this is the definitive work on clinical pediatric urology. For a reference work the detail and completeness are virtues; however, textbooks that pass through several editions often suffer from the fact that, in the interest of completeness, additions are constantly made and deletions are few. The result may be a large and rather unwieldly volume. The author has faced difficulties in deciding the scope of the volume. Should he assume that the reader is well versed in general urology and discuss only the variations concerning infants and children, or should he write a more or less complete treatise on urology, with special attention directed to pediatric problems? The latter course has been chosen and is well exemplified, for instance, in the chapter on urinary calculi in which the entire field, including etiology, pathogenesis, and prophylaxis, has been dealt with at length. Among other subjects, which of necessity overlap and duplicate subject matter found in textbooks of general urology, might be mentioned infection, anomalies, injuries, neuromuscular uropathy, and tumors.

The book is extremely well written, and the author's knowledge of world literature is nothing short of phenomenal. In addition to providing a most complete bibliography at the end of each chapter, the text has been written to portray the developments of each subject from the beginning to the present. In order to do this the author has inserted, in parentheses in the running text, the author's name and year of publication of important articles associated with each step or advance that has been made. Such a method of presentation affords an excellent means of review to the practicing urologist and a most interesting and comprehensive presentation of the subject to the student. The urologist who finds himself confronted with a gradually increasing amount of pediatric urology will especially appreciate the chapter on methods of examination and diagnosis. In this chapter Campbell explains the great difference between methods of diagnosis and treatment in infants and in adults. Detailed description of special urologic instruments available, and their use, will be read with great interest by every urologist. Of no less interest in this regard is the section on nursing care in pediatric urologic surgery, contributed by Helen T. Goddard.

The chapters on embryology and anomalies and urinary obstruction are classics. These are the chapters which everyone thinks of when Campbell's Clinical Pediatric Urology is mentioned. They have been enlarged and improved over the previous edition. The author's wealth of experience in both clinical and necropsy material lends authority to his statements. The bibliographic references inserted in the text make it possible for the reader to survey a vast amount of material quickly. The chapter on operative procedure is well written and illustrated, but here again (except for transurethral procedures, such as litholapaxy and transurethral resection of the vesical neck) it greatly duplicates material found in books on general urology or urologic surgery. The chapter on nephritis and allied diseases in infancy and childhood, written by Elvira Goettsch, is nothing short of a masterpiece. She has clarified a most confusing subject and reduced it to common terms and logic that can be understood by all. The profession will welcome and greatly benefit from this book. The author is to be congratulated on this great contribution, which has required an untold amount of time and work. Probably no better compliment could be paid to the author than to say that, with only a few additions, this work could be redesigned as a two volume book comprising both general and pediatric urology and could take its place as one of the most outstanding books on urology yet written.

Proceedings of the First Conference on Electrokymography Held May 25-26, 1950, in Bethesda, Md., Sponsored by the National Heart Institute. Editors: Bert R. Boone, Frederick G. Gillick, Russell H. Morgan and Morton J. Oppenheimer. Federal Security Agency, Public Health Service, National Heart Institute of National Institutes of Health, Public Health Service publication no. 59. Paper. 75 cents. Pp. 215, with illustrations. Superintendent of Documents, Govern. Print. Off., Washington 25, D. C., 1951.

About 40 investigators in this special field of investigation took part in this conference. Although the group included nearly all those who are doing research on electrokymography, it was small enough to permit free and detailed discussion of each paper. The various technical aspects of this procedure, as well as the clinical application, were covered well in the papers and discussion that followed.

Electrokymography was developed jointly by members of the staff of Temple University Medical School and the United States Public Health Service. The first electrokymograph made its appearance in 1945. The instrument today is essentially a photoelectric device by which the movements of the heart, as they appear on a fluoroscopic screen, are recorded. The heart border movements and changes in density of the cardiac shadow are translated by the electrokymograph to current changes, which, by means of a beam-type galvanometer, can be made to record on moving bromide paper. The record so obtained is called the electrokymogram. Although the earliest workers were concerned with heart border changes, more recent studies seem to indicate that variations in shadow densities over various portions of the heart may eventually be more important clinically. Although the instrument was first used less than six years ago, it is already evident from the papers and discussion at this conference that enough groundwork has been done to proceed with clinical studies, which may have considerable importance in the future.

This booklet is a good reference book for those who are interested in keeping up with a progress being made in this special field of research. The articles are well illustrated. A bibliography of the important work in electrokymography is given at the end of this book.

Statistics for Medical Students and Investigators in the Clinical and Biological Sciences. By Frederick J. Moore, M.D., Associate Professor of Experimental Medicine, University of Southern California School of Medicine, Los Angeles, Frank B. Cramer, B.A., Research Fellow, and Robert G. Knowles, M.S., Research Associate, Department of Experimental Medicine, University of Southern California School of Medicine. Cloth. $3.25. Pp. 113, with 11 illustrations. Blakiston Company (division of Doubleday & Company, Inc.), 1012 Walnut St., Philadelphia 5, 1951.

This book, according to the preface, is more concerned with providing a grasp of the fundamental concepts and philosophies than with developing technical facility in the application of statistical methods. There is reason to doubt whether generalizations can ever be taught without an abundance of specific instances, and, in the case of this book, with its paucity of examples, lack of exercises, vague introductions, and omission of "the mathematics of derivation," there is little that a beginner can get his teeth into. The notion of "control" in the special sense of a contratest (*contre-essai, Gegenversuch*) is not made completely clear, and even a student with some knowledge of biometry is likely to find the allusions to probits baffling. In the hands of an uncommonly good teacher, armed with an abundance of illustrative examples, this book may be useful to graduate students in the clinical and biological sciences, but it cannot be recommended as required or introductory reading for medical students, because its small size is achieved only by the omission of much vital substance.

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated.

QUERIES AND MINOR NOTES

STERILIZATION OF NEEDLES

To the Editor:—*Please answer a few questions: 1. Assuming that a syringe and needle are infected with serum hepatitis virus, how long would one have to boil them (submerged in water in a covered enamel dish) to render them safe for use? 2. Would this method suffice when the infecting agent is poliomyelitis virus? 3. Does the addition of 2% iodine to 70% ethyl alcohol enhance it as a skin antiseptic? 4. What do you consider to be the best skin antiseptic for use before administration of injections? 5. How much of a time interval should elapse between application of skin antiseptic and administration of the injection?* *M.D., Illinois.*

Answer.—1. Fifteen minutes actual boiling is recommended if instruments are free from organic substances (e. g., pus and blood). 2. Yes. 3. Yes. 4. and 5. The comparative efficacy of three common types of skin antiseptics is reported by Hanks and Wallace (*Proc. Soc. Exper. Biol. & Med.* **71**:200 [June] 1949). They found that when areas of which biopsy was to be made for tissue culture were covered with a heavy patch of fabric saturated with 3.5% iodine solution (tincture of iodine 1:2 in 70% alcohol by weight) for two minutes and were then recleaned with alcohol bacterial contamination in subsequent cell cultures was eliminated. Recleaning of the area with alcohol removed the residual iodine, which was toxic to cells in vitro. Frequent contamination was encountered when a quarternary ammonium compound and an organic mercurial were employed.

METRIC VERSUS APOTHECARY SYSTEM

To the Editor:—*It has been ruled in this hospital that all orders are to be written in the apothecary system. What is your opinion of this?* *M.D., Oklahoma.*

Answer.—The metric system for recording weights and measures, based on the decimal system, is the preferred system. It is safer and easier to use. "Since 1893 the U. S. Bureau of Standards has defined all weights and measures in terms of metric units. The metric system is the official system of the United States Pharmacopeia and the National Formulary, and many non-official formularies use it. It is much used in prescriptions, and the physicians of the Army and Navy are required to use the metric system exclusively. In 1943 the Council on Pharmacy and Chemistry of the American Medical Association adopted a resolution to use only the metric system to express dosages in its publications. The use of the metric system is legalized in all of the countries of Europe and South America, and in many of them its use is compulsory for all purposes. It is universally used in science." (American Pharmacy, Philadelphia, J. B. Lippincott Company, 1945, p. 9).

PIGMENTED NEVI

To the Editor:—*What is the latest treatment of pigmented plantar nevi? My patient is a 3-year-old girl, and there is no evident disturbance of the lesion.* *M.D., New York.*

Answer.—Although there is still considerable difference of opinion about the treatment of pigmented nevi, it is generally held that all such lesions, particularly if they are black or slate gray, should be excised if they are located on areas, such as a plantar surface, that are subject to repeated irritations. There is some reason to believe, also, that it is best to do so before the onset of puberty. If the histologic examination shows any activity whatever at the epidermodermal junction, the excised area should be extended widely.

RH CLASSIFICATION

To the Editor:—*Recently I received a report on a blood specimen as follows: Rh factor: positive (Rh$_o$—negative, Rh'—negative, Rh"—positive). Is it not a mistake to call this patient Rh positive, as the report seems to indicate? For could not the patient become sensitized to Rh$_o$-positive blood if it were given to her?* *D. M. Barringer, M.D., Lincoln, Ill.*

Answer.—The blood of the patient in question possesses factor rh", but lacks factors Rh$_o$ and rh', so that this patient belongs to type rh". Since the patient lacks the Rh$_o$ factor, she might become sensitized to this factor if Rh$_o$-positive blood were given to her. Moreover, Rh$_o$ is the most antigenic of the three Rh factors, and the usual cause of Rh sensitization. Therefore, persons like this patient, who lack the Rh$_o$ factor, should be considered Rh negative for clinical purposes. When used as donors, on the other hand, such persons should be considered Rh positive, in order to avoid reactions caused by sensitization to the rh" factor.

FEVER DURING BASAL METABOLISM TESTS

To the Editor:—*In the service manual for the McKesson waterless metabulator, no. 185, appear the following statements: "Each degree of fever will raise the basal rate 7.2%. Patients often have subnormal temperatures. This would, of course, subtract 7.2% per degree." If I interpret this correctly, a patient with a temperature of 97.6 F should have 7.2% added to the reading arrived at. Many technicians do not correct for a subnormal temperature. Would you please advise me as to the accepted procedure on this matter?*

M.D., Nebraska.

Answer.—The manufacturer's statement and your interpretation are correct. However, in routine clinical practice very little attention is paid to the temperature in doing basal metabolism tests, unless the patient actually has fever. When fever is present, the test is usually postponed until the temperature becomes normal.

ANGIONEUROTIC EDEMA OF GALLBLADDER

To the Editor:—*A patient who has had severe hives for over five years occasionally has attacks resembling gallbladder colic. This is followed by an exacerbation of the hives. The gallbladder shadow does not appear in roentgenograms following ingestion of dye. She has been told that this represents internal hives. Could this be possible?* *M.D., Wisconsin.*

Answer.—It is possible to have edema in the gallbladder ducts or in the gallbladder as a result of localized or generalized urticaria or angioneurotic edema. This would be a hazardous diagnosis to make. One of the requirements for localized angioneurotic edema of the gallbladder would be the visualization of the organ by x-ray with dye in the interim between attacks. A more likely cause of the generalized urticaria in this case is the presence of gallbladder infection or other lesion.

SOY BEAN EXTRACTS

To the Editor:—*A man aged 65 informs me that he has experienced definite rejuvenation of his sex life as a result of taking soya lecithin grade "RG" (Glidden). He wants to know if any deleterious effect might follow the long-continued ingestion of this substance. Is there any evidence to show that soya lecithin has any effect on the physiological impotence of old age?* *M.D., Connecticut.*

Answer.—There is no evidence that any of the steroids contained in soy bean extracts have any hormonal action, and there is no evidence that the phospholipids have such an action. No information is available on any deleterious effects from long-continued ingestion.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, SEPTEMBER-DECEMBER 1951

Titles have been listed or abstracts made of important articles in the following journals in the Current Literature Department of The Journal during the past four months. Any of the journals, except those starred, will be lent by The Journal to individual subscribers in Continental United States and Canada and to members of the American Medical Association and its student organization. No charge is made to members, but the fee for other borrowers is 15 cents in stamps for each periodical. Three journals may be borrowed at a time for a period not exceeding five days. Requests should be addressed to the Library of the American Medical Association. Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "ab," abstracts; the asterisk (*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For the author index see page 1847.

A

ACS: See Bogomolets Antireticular Cytotoxic Serum
ACTH: See Corticotropin
ACTHAR: See Corticotropin
ABBOTT LABORATORIES
  sets up radioisotope processing unit, 679
ABDOMEN: See also Ascites; Gastrointestinal Tract; Pelvis; Peritoneum
  dissociation between abdominal skin and abdominal muscle reflexes, [Wartenberg] *1647
  inject air into left (*not right*) side in pneumoperitoneum to avoid air embolism, [Katsman] 1381—C
  lying on abdomen as therapeutic measure, [Stahl] 1716—ab
  pain (paroxysmal) form of epilepsy in children, [Hoefer & others] *1
  pain (recurrent) in children, [Keith] 1392—ab
  Pregnancy in: See Pregnancy, ectopic
  Surgery: See also Appendectomy; Cesarean Section; Gallbladder
  surgery, laparotomy, introducing blood into peritoneal cavity, [Mengert & others] *34
  Viscera: See Viscera
ABNORMALITIES: See also Arachnodoctyly; Crippled; Dwarfism; under specific organ and region as Heart
  circulatory disorders cause of congenital malformations, Paris, 180
  congenital defects, 1453—ab
  fetal malformation, Paris, 180
ABORTION
  abortifacient effect of ovarian hormone preparations, [Läuppi] 95—ab
  claims for legal induction of, Sweden, 1775
  in second trimester, cause of hemorrhage, [Schumann] *811
  missed, amenorrhea after, 288
ABSCESS: See Ulcers; under organs affected as *Brain; Heart; Liver*
  Amebic: See Liver
ABSENTEEISM: See Industrial Health, workers absenteeism
ACACIA
  solution (gum arabic) as blood substitute, (Council report) *658
ACADEMY: See also under names of specific academies; list of Societies at end of letter S
  of Lincei award conferred on Prof. Diamare, 1592
  of Sciences of Ferrara, Italy, 891
ACANTHOLYSIS bullosa: See Epidermolysis bullosa
ACCIDENTS: See also Casualties; Disasters; Trauma; Wounds
  among children, [New York] 582; (Brazil) 1468
  Automobile: See Automobiles
  catastrophic, 69
  Industrial: See Industrial Accidents
  profound accidental hypothermia; "frozen" Negro woman, aged 23, [Laufman] *1201
  Prevention: See National Safety Council
ACET-DIA-MER-SULFONAMIDES (tricombisul) N. N. R., (description) 759; (Schering) 759; (Blue Line Chemical) 1669
ACETYL *di*MORPHINE: See Morphine, diacetyl
ACID
  acetylsalicylic, associated with intestinal bleeding, [Modell & Patterson] *124
  acetylsalicylic, fatalities, [Flaxman] *377
  acetylsalicylic, hypersensitivity to in asthma, [Kind] 702—ab
  allylbarbituric, N. N. R., 1052; (Chemo) 1052
  aminoacetic, glycine treatment of myasthenia gravis not cause of hypertension, 1185
  p-aminobenzoic, synergistic action of cortisone and, in rheumatoid arthritis, [Wiesel] 1597—ab
  p-aminobenzoic, treatment of benign paroxysmal peritonitis, [Willis] *654
  p-aminosalicylic, and amithiozone compared, Sweden, 593
  p-aminosalicylic and chaulmoogra oil plus *streptomycin in* tuberculous meningitis, [Steinmann] 791—ab
  p-aminosalicylic, intracavitary administration, [Gemmi] 1178—ab
ACID—Continued
  p-aminosalicylic, resistant tubercle bacillus, [Rist] 353—ab
  p-aminosalicylic, treatment of pulmonary tuberculosis, [Véran] 352—ab
  p-aminosalicylic, treatment of tuberculosis, (Council report) *253
  p-aminosalicylic, treatment of tuberculous cervical adenitis, [Morris] 93—ab
  ascorbic, and hypertension, [Héroux] 1304—ab
  ascorbic, in tomato juice, (Council report) 951
  ascorbic, treatment of tularemia, 1184
  boric, crystals and cream of tartar in edema, 98
  boric, poisoning in infant, [Brooke] 1780—ab
  Cevitamic: See Acid, *ascorbic*
  citric, cycle, utilization of carbon dioxide by animal organism, 876—E
  dehydrocholic, N. F., N.N.R., (S. E. Massengill) 127
  folic, and blood regeneration, 979—E
  hydriodic, acne produced by, 359
  Hydrochloric: See Stomach acidity
  iodoacetic acid index, inaccuracy in cancer tests, [Henry & others] *37
  mandelic, therapy in colibacillary cholecystitis and cholangitis, [Lücking] 1716—ab
  Mesoxalic, Ureide of: See Alloxan
  nicotinic, nicotinamide in vertigo, 99
  palmitic, conversion to glucose, 1766—E
  phenylpyruvic oligophrenia, [Cantor] 790—ab
  pyruvic, role in chronic alcoholism, Paris, 683
  pyruvic, role in nocturnal cramps, 534
  undecylenic, in psoriasis, [Perlman] 525—C
  undecylenic, of no value in psoriasis, 99
ACID BASE BALANCE: See Acidosis; Alkalosis
ACIDITY
  Gastric: See Stomach acidity
ACIDOSIS: See also Alkalosis
  ammonium chloride, [Sleisenger] 344—ab
  Diabetic: See Diabetes Mellitus
ACNE
  *acneform eruption produced by use of tetra*ethylthiuramdisulfide, [Barefoot] *1653
  produced by iodides, 359
ACRODYNIA: See Erythredema
ACROPARESTHESIA
  syndrome characterized by paresthesias of fingers, Italy, 1467
ACTINOMYCES, Antibiotic Prepared from: See Streptomycin
ACTINOMYCOSIS
  treatment, aureomycin, [McVay] 993—ab
ACTIVITY: See Exercise
  following Operation or Illness: See Convalescence
ADDICTION: See Alcoholism; Narcotics; Phenobarbital
ADDISON'S ANEMIA: See Anemia, Pernicious
ADDISON'S DISEASE
  pernicious anemia in relation to, [Boenheim] 282—ab
ADDRESSES: See Lectures
ADENOMA
  Nontoxic, of Thyroid: See Goiter
  of colon, why considered a precancerous lesion, [Runyeon] *913
  primary, of epididymis, [Longo & others] *937
  Toxic, of Thyroid: See Goiter, Toxic
ADENOMYOSIS: See Endometriosis
ADENOSINE
  5-phosphate treatment of multiple sclerosis, [Shapiro] 777—C
ADIE SYNDROME
  diagnosis; etiology, 97
  first described by C. Markus in 1906, [Beaumont] 340—C
  pupillary inequality, 97
ADIPOSITY: See Obesity
ADMINISTRATIVE MEDICINE
  Institute of, plans for, New York, 1585
ADOLESCENCE
  Children's Medical Center (Boston) to care for, 581
  defined, [Schonfeld] *1424 (footnote)
  employment of 14-16 year olds in industry, (Council report) *660
ADOLESCENCE—Continued
  gynecomastia in young boy, 909
  heroin addiction in boys, [Zimmering] 784—ab
  medical counseling clinics for young narcotic addicts, [Berry] *1129
  personality problems of, general practitioner's role in managing, [Schonfeld] *1424
  problems, research on, by Austin Riggs Foundation, 1461
  school-hospital for young narcotic addicts, N. Y., 1459
ADRENALECTOMY: See Adrenals, surgery
ADRENALIN: See Epinephrine
ADRENALS: See also Addison's Disease
  Adrenocorticotropic Hormone: See Corticotropin
  chronic stress and peptic ulcer, [Gray & others] *1529
  Cortex Compound E: See Cortisone
  cortex function diminished in diabetes; eosinophil test, [Field] 605—ab
  *Cortex Hormone (Crystalline): See Desoxy*corticosterone
  cortex, morphology after giving ACTH and cortisone, [O'Donnell] 342—ab
  cortex, reaction to stress, [Renold] 89—ab
  cortex, relation to surgical risk and postoperative course, [Rehn] 786—ab
  cortex steroids and antibodies in irradiated animals, [Mitchell] 1498—ab
  cortex, symposium on, 174; 1771
  death after corticotropin (ACTH) therapy, [Rule] 1711—C
  Hormone (Sympathetic): See Epinephrine
  hypoadrenalism in newborn infants, [Grotts] 1387—ab
  oncolytic action of epinephrine, 578—E
  relation of salicylate action to pituitary and, [Van Cauwenberge] 1604—ab
  role in chronic stress and peptic ulcer, [Gray & others] *1529
  sclerosis of medulla induced for arterial hypertension, [Riser] 199—ab
  structural changes elicited by emotion, [Schunk] 1504—ab
  study of, in multiple sclerosis, Mass., 1459
  surgery, [Huggins & Bergenstal] *101
  surgery, adrenalectomy (total) for hypertension, [Page] *1314
  surgery, remission of Cushing's syndrome *after adrenalectomy,* [Wilhelm & Dickler] *1235
  surgery, subtotal adrenalectomy for severe hypertension, [Wolferth] 783—ab; [Zintel] 1782—ab
  *tumors, pheochromocytoma, differential diag*nosis; surgical treatment, [Decker & others] *642
  tumors, piperoxan test not specific for, [Conley & Junkerman] *921
  tumors, surgery for, [Huggins & Bergenstal] *101
ADRENOCORTICOTROPIC HORMONE: See Corticotropin
ADSON, A. W., A.M.A. memorial to, 1690
ADULTERY
  question of, in artificial insemination, (Bureau article), *250; 261—E
ADVERTISING: See Medicolegal Abstracts at end of letter M
  State Journal Advertising Bureau: See American Medical Association
AERONAUTICS: See Aviation
AEROSOLS
  Administration by: See Cortisone; Khellin
AEROSPORIN Sulfate: See Polymyxin B Sulfate
AFTERBIRTH: See Placenta
AGE
  Adolescent: See Adolescence
  middle, cardiovascular examination of physicians over 40, [Master] 1079—ab
  of parents, effect on constitution of children, pediatricians discuss, 988
  Old Age: See Old Age
  survival and, in acute myocardial infarction, [Russek & others] *1731
AGGLUTININS
  agglutination test in tularemia, 1184
  cold-hemagglutinin-positive variety of nonbacterial pneumonia in Sweden, 1160
  Rh: See Rh Factor

AGGLUTINOGEN
  Rh: See Rh Factor
AGITATED Depression: See Psychosis, manic depressive
AGRANULOCYTOSIS, ACUTE
  after gantrisin (sulfisoxazole), [Hagerman & Franzblau] *1657
  after maintenance dose of pronestyl in woman 87; recovery, [Inouye & others] *652
AIR: See also Humidity; Oxygen
  Ambulance: See Ambulances
  Attacks: See Air Raids
  dry, in home: optimum humidity percentages recommended, 909
  Embolism: See Embolism
  Injection: See Pneumoperitoneum; Pneumothorax, Artificial
  pollution, (Council report) 1258
  pollution, magazine on: *Air Repair*, 882
  pollution, study of, 583
  pressure legging (pulsatile) for postphlebitic and varicose venous stasis, [Scott] *1195
  University, off-campus opportunities in, 889
AIR FORCE: See Aviation, U. S. Air Force
AIR PASSAGES: See Respiratory System
AIRPLANES: See Aviation
AIR RAIDS
  casualties, nature, [Enloe] *858
  deny, psychological implications of air attacks, [Meerlo] 1594—C
ALBINISM
  possible to improve albino child's tolerance to light? 286
ALBUMIN
  in Blood: See Blood proteins
ALCOHOL
  Addicts: See Alcoholism
  as a diuretic [Schroeder] *1110
  Association for Advancement of Instruction About, 673
  barbiturate synergism, [Sandberg] 349—ab
  Benzyl: See Benzyl Alcohol
  beverages, consumer expenditures for, in U. S. *1930-1950*, (Bureau article) [*Dickinson*] *1354
  can isopropyl alcohol be used in place of ordi*nary alcohol? 1308; (correction) 1610*
  National Committee on Alcohol Hygiene, Inc., enlarges scope, 68
  Propyl: See *Isopropyl Alcohol*
ALCOHOLISM
  chronic, Paris, 683
  evolution, Paris, 774
  Fowler Lectures on, S. C., 881
  hospital unit for alcoholics, New Jersey, 1703
  information, clearing house for, 673
  international discussion, 1371
  symposium on, Georgia, 1769
  treatment, antabuse, [Epstein] 1787—ab
  treatment, antabuse, acne eruption produced by, [Barefoot] *1653
  t[illegible] sychiatric implications, [illegible]
  [illegible] val symptoms, [Bell] 282—ab
  treatment, psychotherapy in pathological drinking, [Strecker] *813
ALGIN
  as blood substitute, (Council report) *658
ALIDASE: See Hyaluronidase
ALIENS: See Physicians, foreign
ALIMENTARY TRACT: See Gastrointestinal Tract
ALKALOSIS: See also Acidosis
  due to hyperventilation, [Goldman] 182—C; [Short] 275—C; [Hoffer] 1070—C
ALLERGY: See also Asthma; Dermatitis venenata; Eczema; Hay Fever; Urticaria
  blood *donors* with allergy acceptable? Will recipient become allergic? 358
  certification in, (by American Board of Inter*nal Medicine*) *483; (by American Board of Pediatrics) *500
  diagnosis, *mistaken for tuberculosis*, [Engelsher] 526—C
  epilepsy due to, [Dees] 991—ab
  experimental hypersensitivity reactions, effect of cortisone, [Humphrey] 1715—ab
  gastrointestinal, simulating regional enteritis, [Blumstein & Johnson] *1441
  insects and allergic problems, [Bowen] 1602—ab
  Prim Comforter, 665
  reaction to tetracaine (pontocaine) used in bronchoscopy, [Weisel & Tella] *218
  sensitivity to ACTH, [Feinberg & others] *40
  sensitivity to acetylsalicylic acid in asthma, [Kind] 702—ab
  sensitivity to aureomycin, [Bedford] 349—ab
  sensitivity to iodine, 1400
  sensitivity to mercaptomerin, [Weissman & Gelfand] *1559
  sensitivity to penicillin and streptomycin, [Schuppli] 611—ab
  sensitivity to printer's ink, 1185
  serum sickness, 360
  shock from wasp stings, [Williams] 348—ab
  treatment, ACTH and *cortisone*, [Feinberg; Cooke] 88—ab; [Seibold] 696—ab
  treatment, Cellu Brand Wheat Free Cake, Wheat-free *Rye Bread*, 575
  treatment, cortisone orally, [Friedlaender] 691—ab
ALLERY—Continued
  treatment, nitrogen mustards, [Jiménez Díaz] 1082—ab
  treatment, procaine with and without honey, [Mancke] 91—ab
  treatment, some common misconceptions, [Feinberg] *617
  where to obtain best materials for testing; intradermal vs. patch *tests*; *extracts to be* used in desensitization, 1399
ALLOXAN
  diabetes, conversion of palmitic acid to glucose in rat, 1766—E
  diabetes, Spanish Society of Nutrition and Digestion discuss, 339
ALOPECIA
  hair loss after *propylthiouracil therapy*, [Clarke] 1711—C
  hair loss due to thiouracil derivatives, [Wilburne] *379
  hair loss in boy aged 4, 708
  idiopathic, treatment in girl 17, 1309
  universalis, 100
ALPHA Omega Alpha Lecture: See Lectures
ALTITUDE
  High: See also Aviation
  high, symposium on physics and medicine of upper atmosphere, 1294
ALUMINUM
  gels to prevent urinary calculi, [Barrett] 1784—ab
  orthohydroxyquinoline sulfate, in vitro activity, [Rossel] 1086—ab
AMBULANCES
  air evacuation of sick and wounded in Korean war, [Hall] *1026
AMBULATION: See Convalescence
AMEBIASIS: See also Colitis, amebic; Liver, amebic abscess
  chronic, [Lehman] 1782—ab
  treatment, comparative value of amebicidal drugs, [Wilmot] 1391—ab
  treatment, fumagillin, [Hrenoff] 347—ab
  treatment, quinacrine-aureomycin-carbarsone, [Radke] 1303—ab
AMENORRHEA
  following electric shock in schizophrenic patient, *1369*
  following missed abortion, 288

financial report, 262
Fund for Medical Education: See subhead: American Medical Education Foundation
General Practitioner's Award, (to Dr. A. C. Yoder) 1671—E; 1702; (balloting) 1675; (resolution on) to include in By-Laws, 1702
health units (local) approved by, 328—E
House of Delegates, Los Angeles Clinical Session, 955; (list of members by states and by sections) 956; (activities) 1572—E; **(proceedings)** 1576; 1673; **1675**; (address of Speaker) 1676; (statement of policy adopted) [Henderson] 1692; (to review organizational structure of standing committees) 1696; (resolution on emergency seating of alternate delegates) 1698
Hygeia: See subhead: *Today's Health*
internships approved by *388
Joint Commission for Accreditation of Hospitals, 761—E; 1683
Joint Committee on Rehabilitation of Council on Industrial Health and Council on Physical Medicine and Rehabilitation, (Council report) 1258
Journal, (increase in circulation; report) 1243; (resolution by Board to send all members of Council of World Medical Association The Journal) 1367
Journal of the Student American Medical Association, first issue Jan. 1952, 982
journals (special) report, 1244
Judicial Council (meeting), 579; (report) 1686
Library, (report) 1245; (Periodical Lending and Package Library Services free to members) 1768
Local Committee on Arrangements, Los Angeles Clinical Session, 955
Los Angeles Clinical Session, Dec. 4-7, 1951, 260—E; 328—E; **(program)** 953; 979—E; (Senators Taft and Byrd to address) 1362; 1572—E; **(proceedings)** 1576; 1673; 1675; (registration) 1768
medical education survey by, *135
medical schools approved by, *135; *136; *159
membership, (report) 1241; (dues) 1242
membership dues, resolution on cancellation of delinquent dues, 1700
Microbiologic Laboratory, (report) 1254
Motion Picture Film Library, List of Pictures Reviewed: See Moving Pictures, Medical
Motion Picture Film Library, (report) 1269; (new film added to) 1298
National Broadcasting Company congratulated on 25th anniversary, 516
National Conference on Medical Civil Defense sponsored by A.H.A. and, 264; (President Cline's monthly message) 877; 883; 1582
National Conference on Physicians and Schools (rd), Nov. 6-8, 1951, 982; 1574—E
New and Nonofficial Remedies, (report) 1250
Niehoff (Hattie A.), message from, 1702
office plaque, (report) 1054—E; 1272
Officers, reports, 1241
official bodies, meetings of, 579
President Cline, address, Los Angeles Session, 1677
President, resolution on honoraria for, 1697
President-Elect address: Working Together in '52, [Bauer] *1509
President-Elect Bauer visits air base, 1582
President-Elect, resolution on honoraria for, 1697
President's Page, a monthly message, (Sept.) 515; (Oct.) 877; (Nov.) 1362
Proceedings of Meeting of House of Delegates, Los Angeles Session, 1576; 1675
public relations, 1242
Quarterly Cumulative Index Medicus, (report) 1246
radio broadcast by N. B. C., 1702
radio program "Here's the Doctor," authorized by Board of Trustees, 1367
Reference Committee on Amendments to the Constitution and By-Laws, (report) 1690; 1698
Reference Committee on Hygiene and Public Health, (report) 1681; 1684; 1696; 1698
Reference Committee on Industrial Health, (report) 1682
Reference Committee on Insurance and Medical Care, (report) 1683; 1690; 1698; 1700
Reference Committee on Legislation and Public Relations, (report) 1686; 1699; 1701
Reference Committee on Medical Education and Hospitals, (report) 1685; 1687; 1702
Reference Committee on Medical Military Affairs, (report) 1682; 1700
Reference Committee on Miscellaneous Business, (report) 1685; 1686; 1687; 1699; 1700; 1701
Reference Committee on Reports of Board of Trustees and Secretary, (report) 1681
Reference Committee on Sections and Section Work, (report) 1689
Reference Committees, (membership) 1676
resolution on approval of internships, 1241; 1702
resolution on Blue Cross benefits for use of physicians' office facilities, 1700
resolution on cancellation of delinquent dues, 1700
resolution on congressional investigation of the teaching of collectivism in schools, 1699
resolution on costs of all technical and professional training, 1242; 1686
resolution on critical materials, 1701
resolution on death of Dr. James Edgar Paullin, 1699
resolution on death of John F. Hayes, 1699
resolution on deferment of chiropractic students, 1699
resolution on deficient teaching programs of dermatology and syphilology of some medical schools, 1701
resolution on distribution of medical care, 1242; 1683
resolution on emergency seating of alternate delegates, 1698
resolution on fluoridation of water supplies, 1698
resolution on free choice of physicians for federal employees, 1241; 1686
resolutions on health problems of older worker, 1702
resolution on honoraria for President and President-Elect, 1697
resolution on medical care insurance on service basis for dependents of members of armed forces, 1697
resolution on medical care of veterans, 1700; 1701
resolution on medical fees, 1700
resolution on medical relations in workmen's compensation, 1242
resolution on Negro physicians society being admitted as a constituent association, 1241
resolution on place of interim sessions of House of Delegates, 982; 1241; 1702
resolution on proposed amendment to by-laws to include general practitioner award, 1702
resolution on publicizing American medicine, 1242; 1686
resolution on purchase of property in Washington, 1698
resolution on retirement benefits and pension plans for physicians, 1242
resolution on stamps of approval for iodized salt packages, 1242
resolution on use of veterans' facilities by veterans with non-service-connected disabilities, 1701
resolution recommending that general practice residencies provide 8 of 24 months devoted to surgery, (Council report) 1273
Rourke (A. J. J.) address of president of A.H.A., Los Angeles Session, 1679
Scientific Exhibit, (Los Angeles) 962; (Chicago, in 1952) 982; 1367; (Atlantic City; Cleveland) 1268; (Los Angeles) 1674; (Chicago Session) 1768
Scientific Program, Los Angeles Clinical Session, 958; 1673
Secretary, report, 1241
Section on Anesthesiology, (chairman's address) [Stewart] *1005
Section on Dermatology and Syphilology, (chairman's address) [Dalton] *799
Section on Experimental Medicine, (chairman's address) [Greene] *1096; (joint symposium on arteriosclerosis and hypertension) [Burchell & others] *1509; [Keys] *1512
Section on Gastro-Enterology and Proctology, (chairman's address) [Runyeon] *913
Section on General Practice, (chairman's address) [Bibler] *361
Section on Internal Medicine, (chairman's address) [Palmer] *1187; (joint symposium on arteriosclerosis and hypertension) [Burchell & others] *1509; [Keys] *1512
Section on Laryngology, Otology and Rhinology, (chairman's address) [Robb] *293
Section on Military Medicine, officers appointed for first meeting, (Council report) 1278
Section on Nervous and Mental Diseases, (chairman's address) [Karnosh] *289
Section on Obstetrics and Gynecology, (chairman's address) [Hunt] *999
Section on Pediatrics, (panel discussion on therapy of infectious diseases) [Hodges] *1335; [Spaulding & Anderson] *1336; [Nelson] *1340
Section on Physical Medicine and Rehabilitation, (chairman's address) [Piersol] *1093
Section on Preventive and Industrial Medicine and Public Health, (chairman's address) [Johnstone] *911; (symposium on critical evaluation of public health program) [Wright] *1408; [Jolliffe] *1411; [Buerki] *1414; [Silver] *1416; (symposium on aging), [Velz] *1319; [Scheid] *1323; [Randall] *1325; [Moore] *1327; [Franco] *1328; [Himler] *1330
Section on Radiology, (chairman's address) [Dickinson] 709
Section on Surgery, General and Abdominal, (chairman's address) [Ravdin] *535
Section on Urology, (chairman's address), [Taylor] *808
Sections, representatives appointed to Scientific Exhibit, Chicago Session, 1952, 1367
Session on Allergy, (chairman's address) [Feinberg] *617
sinister attacks on by physicians, [Johnstone] *911
Speed (Kellogg) presentation of citation to, 1702
Standard Nomenclature of Diseases and Operations, (report) 1245; (4th ed.) 1456—E
State Journal Advertising Bureau, (report) 1246
Student A.M.A., (*Journal*) 982; (report) 1282; [Foster] 1711—C
Symposium: See *subheads*: Section on Internal Medicine; Section on Preventive and Industrial Medicine and Public Health
Technical Exposition, Los Angeles Clinical Session, 973; 1674
television program, Los Angeles Clinical Session, 960

AMITHIOZONE (conteben; myvizone; TB I-698; tibione)
  compared with paraaminosalicylic acid, Sweden, 593
  treatment of pulmonary tuberculosis, [Sandhaus] 1073—ab
  treatment of tuberculosis, (Council report) *257; [Belgorod] 600—ab
AMNION
  tissue implantation in surgical diseases, [Tinozzi] 1178—ab
AMNIOTIC FLUID
  circulatory disturbances in genesis of congenital malformations, Paris, 180
AMMONIUM COMPOUNDS
  chloride acidosis, [Sleisenger] 344—ab
  chloride, how to convert alkaline urine to acid urine? 207
  sulfite, test for lead in urine, 708
  Tetraethyl—: See Tetraethylammonium
AMPHETAMINE: See also Methamphetamine
  sulfate-U. S. P., N. N. R., (Physicians' Drug & Supply Co.) 127; (Biorganic) 325
  treatment of epilepsy evaluated, [Ives] *1332
ANALBIS
  suppositories fatalities, [Flaxman] *378
ANALGESIA: See Anesthesia; Pain, relief of
ANAPHYLAXIS: See Allergy
ANATOMY
  comparative, value in study of human emotions, [White] 1381—C
  Morbid: See Pathology
ANDROGENS
  testosterone propionate-U. S. P., N. N. R., (Metropolitan Laboratories) 127
  testosterone treatment: hypertensive disease not a contraindication, 707
  testosterone treatment of Simmonds' disease, [Robertson] 789—ab
  treatment combined with estrogens, 707
  treatment of metastasizing carcinomas of female genitalia, [Prediger] 1502—ab
  treatment of pituitary dwarfism, [Greene] *1096; [Schneeberg] 1777—C
ANEMIA: See also Anemia, Pernicious
  aplastic, complicating streptomycin treatment of pulmonary tuberculosis, [Sacks & others] *308
  atrophy of bone marrow cause of Jaksch-Hayem-Luzet syndrome, [Veeneklaas] 1084—ab
  erythroblastic familial (Cooley), refractory to iron, but responsive to cobalt, [Heilmeyer] 92—ab
  hemolytic [illegible] treated with corticotropin, [illegible]
  hemolytic, [illegible] 1075—ab
  Hypochromic: See Plummer-Vinson Syndrome
  secondary, Whipple principle in treatment, 359
  severe, with diaphragmatic hernia after transabdominal vagotomy, [Van Hock & Musselman] *857
  sickle cell, and sickle cell trait, [Kondi] 792—ab
  sickle cell, cardiac status, [Aaron] 694—ab
  sickle cell disease among Oriental Jews, Israel, 524
  Splenic: See Gaucher's Disease
  symptom of hypoproteinosis, [Lynch & Snively] *117
  treatment, intravenous iron, [Passarelli] 283—ab
ANEMIA, PERNICIOUS
  Addison's disease and, [Boenheim] 282—ab
  census, Denmark, 1709
  tissue biology of, Dr. Wilton's report on, Sweden, 1160
  treatment, hemopoietically active extracts from feces, [Callender] 609—ab
  treatment, Castle's extrinsic factor, [Gordin] 1390—ab
  treatment, vitamin B_{12}, [Menof] 791—ab
  vitamins and blood regeneration, 979—E
ANESTHESIA
  brachial plexus block in children [Small] *1648
  caudal, solution pontocaine hydrochloride, N. N. R., (Winthrop-Stearns) 127
  emergency aspirating bronchoscope for anesthetist, [Emerson] *1238
  essentials of, 3 simple rules to prevent anesthetic deaths, 1663—ab
  general or local, in tonsillectomy in adults, [Kofler] 611—ab
  in Labor: See Anesthesia, spinal
  local, cocaine and pontocaine compared, [Ireland] 1388—ab
  narcotics in preanesthetic medication, [Cohen & Beecher] *1664
  respiratory problems of barbiturate poisoning, 874—E
  screen, improved; [Cole] *318
  spinal, continuous-drip subarachnoidal block for labor and delivery, [Carpenter] 186—ab
  spinal, followed by intestinal obstruction, 1184
  spinal, for post partum atony of uterus, [Fuchs] 281—ab; (correction) 768
  spinal, hazards of lumbar puncture, [Dripps & Vandam] *1118
  spinal, human serum albumin intravenously for cerebral edema after cardiac arrest, [Cole] *1563
  spinal, paravertebral lumbar sympathetic block in labor, [Reich] 186—ab
  spinal, pencil-point needle to prevent headache after, [Hart & Whitacre] *657
  spinal, pontocaine hydrochloride "niphanoid", N. N. R., (Winthrop-Stearns) 127
  topical, in bronchoscopy, reaction to tetracaine (pontocaine), [Weisel & Tella] *218
ANESTHESIOLOGY
  American Board of: See American Board
  graduate course in, 1705
ANEURYSM
  aortic, with regurgitation, in syphilitic, penicillin for, [Stokes & others] *948
  Arteriovenous: See also Fistula, arteriovenous
  arteriovenous cerebral, ligate carotid artery in, [Maspes] 1790—ab
  carotid-cavernous sinus, ligate common carotid for, [Bassett & Gass] *844
  circle of Willis, ligate internal carotid artery for, [Bassett & Gass] *842
  dissecting, in mother and son, [Griffiths] 904—ab
  treatment, fascia lata applied as graft about arteries after aneurysmorrhaphy, [Wylie] 1389—ab
ANGINA
  Agranulocytic: See Agranulocytosis, Acute
ANGINA PECTORIS
  herniated cervical disk simulating, [Weinberg] 1303—ab
  treatment, propylthiouracil, Waitzkin] 86—ab
  treatment, radioactive iodine, 1508
  treatment, talcum in pericardial cavity for, (reply) [Thompson] 708
ANGIOCARDIOGRAPHY: See Heart
ANGIOGRAPHY: See Arteries, roentgen study
ANGIOSPASM: See Raynaud's Disease
ANILINE
  methemoglobinemia due to; in chemistry student, [Stening] 198—ab; (reply) [Jacobson] 1777—C
ANIMAL EXPERIMENTATION
  British condemn experiments in U. S. and Canada, [Barcroft & others] 1380—C
  exhibit on, 1768
  legal status in U. S., map showing, by National Society for Medical Research, 1371
  state laws on, (Bureau report) 1264
ANIMALS: See also under specific names of animals as Cats; Dogs; Muskrats
  Experimentation on: See Animal Experimentation
  food-producing, tumors in, 1671—E
  hibernation, prolonged clotting time adapts to, 1766—E
  in research, A.M.A. exhibit on, 1768
  utilization of carbon dioxide by animal organism, 876—E
  zoonoses: 80 known diseases transmitted to man by vertebrate animals, 303—ab
ANKLE
  sprains (lateral), treated by sural nerve block, [Hutcheson] 696—ab
ANNUAL Conference: See American Medical Association
ANOMALIES: See Abnormalities; under names of specific organs as Heart
ANOREXIA: See Appetite
ANOXEMIA: See Blood oxygen
ANTABUSE: See Tetraethylthiuramdisulfide
ANTIBIOTICS: See also Aureomycin; Bacitracin; Chloramphenicol; Neomycin; Penicillin; Streptomycin; Terramycin
  antagonism, 513—E
  antagonism and synergism, [Speck] 779—ab
  fatalities, [Flaxman] *378
  H-3, fumagillin treatment of amebiasis, [Hrenoff] 347—ab
  resistance; rapid tests for, "Petri dish-cover glass method", [Walch] 1503—ab
  susceptibility; paper disk test, [Spaulding & Anderson] *1336; 1360—E
ANTIBIOTICS—Continued
  toxicity: diarrhea, 1428—ab
  toxicity: steatorrhea, [Merliss] 1601—ab
  treatment, clinical bases for selecting patients for, [Nelson] *1340
  treatment, combinations used in infectious diseases, [Wellman] 191—ab
  treatment, delays diagnosis of tuberculosis, [Oatway] 900—ab
  treatment, laboratory control, 1360—E
  treatment of asthma and hypertrophic pulmonary emphysema, [Barach] *730
  treatment of early syphilis, [Robinson] 185—ab
  treatment of pertussis, [Hazen] 527—ab
  treatment of pneumonia in children, autopsy study, [Menten] 85—ab
  treatment plus extrapleural pneumothorax in pulmonary tuberculosis with cavity formation, [Herrmann] 96—ab
  treatment plus sulfonamides of Friedländer's pneumonia, [Kirby] 1168—ab
  treatment [illegible] of renal carbuncle [illegible]
  treatmen[illegible] n atrophic rhinitis, [illegible]
ANTALLERGAN
  treatment of symptomatic psychosis, [Tolsma] 352—ab
ANTHISAN: See Pyrilamine
ANTIBODIES: See also Agglutinins
  antigen, mechanism in rheumatic diseases, [Brown] 277—ab
  globulin molecules in infants, half-life of passively acquired, [Wiener] 1600—ab
  in irradiated animals and adrenal cortical steroids, [Mitchell] 1498—ab
  Rh: See Rh Factor
ANTICOAGULANTS: See Bishydroxycoumarin; Blood coagulation; Heparin
ANTIDIURETICS
  activity of neurogenic hypotensive serum in hypertension, [De Paiva] 1498—ab
  effect of nicotine, [Burn] 994—ab
  principle in urine and ascitic fluid in liver cirrhosis, [Schiller] 1180—ab
ANTIGENS
  injections, poliomyelitis after, [Anderson] 695—ab
  mechanism in rheumatic diseases, [Brown] 277—ab
  Rh: See Rh Factor
ANTIHISTAMINES: See Histamine
ANTI-INFECTIVES: See Sterilization, Bacterial
ANTI-LEWISITE, British: See BAL
ANTIMICROBIAL Agents: See Antibiotics
ANTIRETICULAR Cytotoxic Serum of Bogomolets: See Bogomolets
ANTISEPTICS: See Sterilization, Bacterial
ANTITOXIN: See Tetanus
ANURIA: See Urine suppression
ANUS: See also Rectum
  anorectal syndrome, side-effects of terramycin, [Willcox] 1084—ab
  cancer, Belgium, 1379
  Pruritus: See Pruritus
AORTA
  coarctation, complete transposition of main arterial stems, [Nichol & Segal] *645
  coarctation, surgical treatment, [Claggett] 1384—ab
  coarctation, treatment when resection is impossible, [Boerema] 195—ab
  congenital pulmonary stenosis without overriding of, [Larsson] 780—ab
  manual occlusion for cardiac arrest; complete recovery after 25 minutes, [Carter] *1347
  rupture (traumatic delayed) after auto accident in pregnancy, [Rice & Wittstruck] *915
  surgery, place free vein graft between coronary sinus and, for coronary disease, [Beck & others] *1726
  transposition of, and pulmonary artery, 1670—E
AORTITIS
  syphilitic, efficacy of penicillin, [Stokes & others] *944
APHASIA
  Introduction to Aphasia, (film review) 1298
APOPLEXY: See Brain hemorrhage
APOTHECARY SYSTEM
  versus metric system, 1794
APPARATUS: See also Diathermy; Hearing Aids; Ultraviolet Rays, lamps
  anesthesia screen (improved), [Cole] *318
  arm rest for surgical assistant, [Cole] *319
  nurses radiation protection meter, "Poppycock," [Brucer] *1746
  used for intra-arterial transfusion, [Silver & others] *1627
APPENDECTOMY
  during cholecystectomy, 1759—ab
APPENDICITIS
  diagnosis, gastrointestinal allergy simulating, [Blumstein & Johnson] *1441
APPENDIX
  cancer (primary), [Sillery] *854
  Excision: See Appendectomy
APPETITE
  anorexia nervosa, [Eitinger] 701—ab
  anorexia nervosa, corticotropin and cortisone in, [Greenblatt] 901—ab

of childhood, [Lynch & Snively] *115
plea: eating coffee grounds in 4 year old boy, 706
APPLES
sauce, Blue Boy Brand Dietetic Pack, 951
APRICOTS
dessert with tapioca, Beech-Nut, strained, 1455
APROBARBITAL
N. N. R., (Chemo) 1052
sodium, N.N.R., 1052; (Chemo) 1052
AQUAPHOR
should not be used for penicillin in ophthalmic ointment base, (replies) [Ewing; Welch] 910
1178—ab
e American Medical special)
ARCTIC
Research Center of U. S. Public Health Service, 1466
ARGENTINE
Congress on Cancer (first), 1469
ARGYROSIS
parkinsonism and, 1186

  cardiac accidents after; dosage necessary to affect intestines [Brunn] 182—C
VEGETABLES: See *also Beets; Peas; Potatoes*; Tomato juice
  Blue Boy dietetic pack, 951
VEGETATIVE *Nervous System*: See Nervous System, Sympathetic
VEINS: See also Blood Vessels
  axillary, effort thrombosis of with pulmonary embolism, [Samuels] 595—C
  Caval: See Vena Cava
  femoral pulse, absence or diminution as sign of venous thrombosis, [D'Alessandro] *1759
  Fistula: See Fistula, arteriovenous
  graft (free) placed between coronary sinus and aorta for coronary artery disease [Beck, & others] *1726
  Inflammation: See Phlebitis; Thrombophlebitis
  Injection into: See Injections, intravenous
  ovarian, ligation in suppurative pelvic *thrombophlebitis*, [Collins] 1174—ab
  popliteal, ligation in postphlebitic syndrome of lower extremities, [Castagna] 1177—ab
  Portal: See Portal Vein
  Pressure in: See Blood Pressure, venous
  puncture in infants to secure blood for tests, 798
  saphenous, inject iodopyracet via, for angiocardiography, [Jacobs & others] *1051
  Sclerosis of: See Phlebosclerosis
  subclavian (left), embolism with thoracic duct obstruction; resulting chylous ascites, [Palken & Weller] *566
  Thrombosis: See Thrombosis
  Transfusion via: See Blood Transfusion
  Varicose: See Varicose Veins
VENA CAVA
  inferior, ligate to control pulmonary emboli, [Pratt] *126
  inferior, ligation in suppurative pelvic thrombophlebitis, [Collins] 1174—ab
  portacaval shunt for portal hypertension, [*Blakemore*] *1074—ab*
  superior, obstruction, angiocardiography in, [Jacobs & others] *1051
VENEREAL DISEASE: See *also* Gonorrhea; Lymphogranuloma, Venereal; Syphilis
  control, [Wright] *1408
  control campaign in Ethiopia by World Health Organization, 1151
  in 7 leading cities in U. S., 1771
  lowest state rate, Minnesota, 671
  prevention with condoms, Norway, 77
  recent advances in study of, symposium on, 1461
VENTILATION
  Hyperventilation: See Respiration
  Hypoventilation: See Respiration
VENTRICULAR FIBRILLATION
  effects of electric currents on canine heart, [Mackay] 1492—ab
VERATRUM VIRIDE
  treatment of hypertension, [Freis] 191—ab; [Page] *1316
VERRUCA
  acuminata: See Condylomata
  warts of tongue, formaldehyde for, 1399
VERTEBRAE: See Spine
VERTIGO: See also Syncope
  aural, Ménière's disease, [Hoogland] 790—ab
  aural, therapy of Ménière's disease, 294—ab
  treatment, nicotinamide, 99
VESICATION: See Blister
VETERANS: See also American Legion
  disabled, prosthetic and sensory aids service for, 679
  in medical schools, *143; *146
  Medical Care: See also Hospitals, veterans
  medical care, A.M.A. resolution on, 1700; 1701
  medical care, A.M.A. resolution on treating non-service-connected disabilities, 1701
VETERANS ADMINISTRATION
  chemotherapy of tuberculosis in man, present status, (Council report) *253
  Hospitals under control of: See Hospitals, veterans
  investigation of, 1056
  medical employees exempted from personnel cut, 680
VIBRATION
  damage caused by riveting: tenosynovitis, "dead fingers" or "white fingers," 1308
VINEGAR
  what harm does it do in human body? 708
VINSON-PLUMMER Syndrome: See Plummer-Vinson Syndrome
VIOLINIST
  psoriasis in, 99
VIOMYCIN
  treatment of tuberculosis, (Council report) *256

AUTHOR INDEX

In this Index are the names of the authors of articles which have appeared in THE JOURNAL, the names of those who have read papers before Societies as published in THE JOURNAL and those whose articles have been abstracted in the Current Medical Literature Department. The * preceding the page reference indicates that the article appeared in full in THE JOURNAL.

For subject index see page 1797.
